

WEST VIRGINIA DIVISION OF HIGHWAYS

STANDARD SPECIFICATIONS ROADS AND BRIDGES

Adopted 2000

Copies of these Standard Specifications may be obtained from the Contract Administration Division, West Virginia Division of Highways, 1900 Kanawha Boulevard, East, Building Five, Room 737, Charleston, West Virginia 25305-0430. Electronic copies of this book can be obtained via the Internet at www.WVDOT.com. *The Electronic version of the 2000 Edition Standard Specifications for Roads and Bridges is intended for reference and information only. The printed bound version is to be used as the Governing Specifications for all projects.*

FOREWORD

"This book has been prepared to provide a compilation of Standard Specifications for use by reference in the Division's construction contracts.

This 2000 edition of the West Virginia Division of Highways Standard Specifications, Roads and Bridges, has been issued with the intention to use it for all projects on which bids are received after January 1, 2000.

An effort has been made to include all the Supplemental Specifications and Special Provisions in effect at this time.

The requirements of these Specifications may be amended from time to time by Supplemental Specifications or by Special Provisions applicable to the specific contract. Reference, by title and date, will be made to the governing provisions on Plans or Contract Documents."

A handwritten signature in black ink, reading "Samuel H. Beverage". The signature is fluid and cursive, with the first letters of the first and last names being capitalized and prominent.

Samuel H. Beverage, P.E.
Commissioner
Division of Highways

TABLE OF CONTENTS

DIVISION 100-GENERAL PROVISIONS

Section

101	Definition of Terms
102	Bidding Requirements and Conditions
103	Award and Execution of Contract
104	Scope of Work
105	Control of Work
106	Control of Materials
107	Legal Relations and Responsibility to Public
108	Prosecution and Progress
109	Measurement and Payment
110	Miscellaneous Provisions

DIVISION 200-EARTHWORK

201	Clearing and Grubbing
202	Building Demolition
203	Dismantling Structures
204	Mobilization
207	Excavation and Embankment
211	Borrow Excavation
212	Structure, Rock, and Wet Excavation
217	Special Rock Fill
218	Slope and Foundation Protection
219	Controlled Low-Strength Material
228	Subgrade Preparation
229	Shoulders and Ditches
240	Cleaning Culverts, Inlets and Manholes

DIVISION 300-BASES

307	Crushed Aggregate Base Course
308	Traffic Bound Base Course or Shoulder
311	Open Graded Free Draining Base Course
314	Aggregate Subbase

DIVISION 400-BITUMINOUS PAVEMENTS

Section

- 401 Hot-Mix, Asphalt Wearing and Patching, and Leveling Courses
- 402 Hot-Mix Asphalt Skid Resistant Pavement
- 405 Surface Treatments
- 408 Tack Coat
- 409 Prime Coat
- 412 Winter Grade Asphalt Patching Mixture
- 415 Removing Existing Pavement Surface

DIVISION 500-RIGID PAVEMENT

- 501 Portland Cement Concrete Pavement
- 502 Approach Slabs
- 503 Sealing Joints and Cracks in Concrete Pavement
- 504 Bituminous Underseal For Concrete Pavement
- 506 Concrete Pavement Repair and High Early Strength Concrete Pavement Repair
- 507 Crack and Pothole Repair

DIVISION 600-INCIDENTAL CONSTRUCTION

- 601 Structural Concrete
- 602 Reinforcing Steel
- 603 Prestressed Concrete Members
- 604 Pipe Culverts
- 605 Manholes and Inlets
- 606 Underdrains
- 607 Guardrail
- 608 Right-Of-Way Fence
- 609 Sidewalks
- 610 Curbs, Combination Curbs and Gutters and Medians
- 611 Precast Concrete Traffic Dividers
- 612 Tunnel Liner Plate Pipe
- 614 Piling Walls
- 615 Steel Structures
- 617 Railings
- 618 Cast Bronze and Rolled Copper-Alloy Expansion Plates
- 619 Waterproofing
- 621 Steel Grid Flooring
- 622 Timber Bridge Structures
- 623 Pneumatically Applied Mortar
- 624 Preformed Elastomeric Joint Sealer

625	Drilled Caisson Foundations
626	Retaining Wall Systems
631	Electrical Work
632	Horizontal Drains
633	Concrete Gutter, Invert Pipe Gutter, or Dumped Rock Gutter
634	Concrete Cribbing
635	Metal Cribbing
636	Maintaining Traffic
637	Water
638	Project Markers, Right-Of-Way Markers, and Survey Markers
639	Construction Layout Stakes
640	Field Office and Storage Building
641	Mitigation Devices
642	Temporary Pollution Control
651	Furnishing and Placing Topsoil
652	Seeding and Mulching
653	Vine and Ground Cover Planting
654	Tree and Shrub Planting
655	Matting For Erosion Control
656	Seedling Planting
657	Roadside Sign Support
658	Overhead Sign Structures
659	Sign Lighting
660	Traffic Signals
661	Traffic Signs and Delineators
662	Roadway Lighting
663	Pavement Markings
664	Traffic Safety Devices
665	Plugging Gas, Oil, and Drilled Water Wells
670	Waterline Installation
675	Sanitary Sewers
688	Painting Steel Structures
689	Metalizing Steel

DIVISION 700-MATERIAL DETAILS

Section

701	Hydraulic Cement
702	Fine Aggregate
703	Coarse Aggregate
704	Stone and Crushed Aggregate
705	Asphalt Materials
707	Concrete Admixtures, Curing and Coating Materials
708	Joint Materials
709	Metals
710	Wood Materials
711	Paints, Coatings, Oils, And Inks
712	Guardrail and Fence
713	Metal Pipe
714	Concrete, Clay, Fiber and Plastic Pipe
715	Miscellaneous Materials
716	Embankment and Subgrade Material
717	Compaction Control of Base Course Material
718	Sewer and Waterline Material

DIVISION 100

GENERAL PROVISIONS

SECTION 101

DEFINITION OF TERMS

101.1-ABBREVIATIONS:

Whenever the following abbreviations are used in these Specifications, Plans or Contract Documents, they are to be construed the same as the respective expressions represented:

AAN — American Association of Nurserymen
AAR — Association of American Railroads
AASHTO — American Association of State Highway and Transportation Officials
AIA — American Institute of Architects
AISC — American Institute of Steel Construction, Incorporated
AISI — American Iron and Steel Institute
AMA — Automotive Manufacturer's Association
AMS — Aerospace Material Specification
ANSI — American National Standards Institute
ARA — American Railway Association
AREA — American Railway Engineering Association
ASCE — American Society of Civil Engineers
ASD — Aluminum Standards & Data-Aluminum Association
ASLA — American Society of Landscape Architects
ASTM — American Society for Testing and Materials
AWWA — American Water Works Association
AWS — American Welding Society
FHWA — Federal Highway Administration
FSS — Federal Specifications and Standards, General Services Administration
IEEE — Institute of Electronic and Electrical Engineers
IPCEA — Insulated Power Cable Engineers Association
ISA — Instrument Society of America
MIL — Military Specification
MP — Materials Procedure (see 101.50 for definition)
NBFU — National Board of Fire Underwriters
NEC — National Electric Code
NEMA — National Electrical Manufacturer's Association
PEI -ALS — Porcelain Enamel Institute: Aluminum Standards
UL — Underwriters Laboratories
SAE — Society of Automotive Engineers
SSPC — Society for Protective Coatings
TTE -TTP — Federal Specifications and Standards

101.2

101.2-ACCESS CONNECTION:

Any roadway facility by means of which vehicles enter or leave arterial highways.

101.3-ADVERTISEMENTS:

The public announcement, as required by law, inviting bids for work to be performed, or material to be furnished.

101.4-ARTERIAL HIGHWAY:

A general term denoting a highway primarily for through traffic.

101.5-AUXILIARY LANE:

The portion of the roadway adjoining the traveled way for parking, speed-change or other purposes supplementary to through traffic movement.

101.6-AWARD:

The acceptance by the Division of a bid.

101.7-BASE COURSE:

A layer or layers of specified material of designated thickness placed on a subbase or a subgrade to support a surface course or courses.

101.8-BIDDER:

An individual, firm, corporation, or combination thereof, acting directly or through a duly authorized representative, and prequalified according to the requirements and provisions of the Division, submitting a bid for the proposed work.

101.9-BRIDGE:

A structure, including supports, erected over a depression or an obstruction, such as water, a highway or railway and having a track or passageway for carrying traffic or other moving loads and having a length measured along the center of roadway of more than 20 ft. (6.1 meters) between undercopings of abutments or extreme ends of openings for multiple boxes.

The length of a bridge structure is the overall length measured along the line of survey stationing back to back of abutments if present, otherwise, end to end of the bridge floor, but in no case less than the total clear opening of the structure. Roadway width is the clear width measured at right angles to the longitudinal centerline of the bridge between the bottom of curbs.

101.10-CALENDAR DAY:

Every day shown on the calendar.

101.11-CERTIFIED TECHNICIAN:

A Certified Technician is an individual who has been examined by the joint Industry-Division Certification Board and deemed competent in the particular

technical field for which the individual has been examined. This competency is documented by written notification and issuance of a certificate to the individual and remains in effect for a given period of time as determined by the regulations of the Board. Should any questions develop concerning the status of an individual, verification may be made through the Training section of the Personnel Division of the Division.

101.12-CHANGE ORDER:

A general term referring to force account work orders, supplemental agreements, and work orders of the Contract.

101.13-CHANNEL:

A natural or artificial water course.

101.14-CITY, TOWN OR DISTRICT:

A subdivision of the county used to designate or identify the location of the proposed work.

101.15-COMMISSIONER:

West Virginia Commissioner of Highways.

101.16-CONSTRUCTION LIMITS:

The physical limits of construction as described by designated lines drawn on the Plans.

101.17-CONTRACT:

The written agreement between the Division and the Contractor covering the performance of the work, the furnishing of labor, equipment and materials, and the basis of payment. The Contract includes the invitation of bids, proposal, contract form, contract bond, specifications, supplemental specifications, special provisions, plans, notice to proceed, any change orders and supplemental agreements that are required to complete the construction of the work in an acceptable manner, including authorized extensions thereof, all of which constitute one instrument.

101.18-CONTRACT BOND:

The approved form of security, executed by the Contractor and their surety, guaranteeing completion of the work and payment of all legal debts pertaining to the construction of the project.

101.19-CONTRACT PERIOD:

The period from the specified date of commencement of work to the specified date of completion of the work, both dates inclusive, as is specified in the Contract.

101.20

101.20-CONTRACT TIME:

The number of work or calendar days specified in the proposal, indicating the time allowed for the completion of the work contemplated, including authorized time extensions. In case a calendar date of completion is specified in the proposal, the work shall be complete by that date or any approved extensions thereof.

101.21-CONTRACTOR:

The individual, firm or corporation, party of the second part to the Contract, acting directly or through their agents, employees, or subcontractors.

101.22-CONTROL OF ACCESS, FULL:

The condition where the right of owners or occupants of abutting land or other persons to access, light, air or view in connection with a highway is fully controlled by public authority. The authority to control access is exercised to give preference to through traffic by providing access connections with selected public roads only and by prohibiting crossings at grade or direct driveway connections.

101.23-CONTROL OF ACCESS, PARTIAL:

The condition where the right of owners or occupants of abutting land or other persons to access, light, air or view in connection with a highway is partially controlled by public authority. The authority to control access is exercised to give preference to through traffic to a degree that, in addition to access connections with selected public roads, there may be some crossings at grade and some private driveway connections.

101.24-COUNTY:

The County or Counties of West Virginia in which the work is to be done.

101.25-CULVERT:

Any structure not classified as a bridge which provides an opening under the roadway.

101.26-DEPARTMENT:

West Virginia Department of Transportation.

101.26.1 - Division: West Virginia Division of Highways

101.27-DIVIDED HIGHWAY:

A highway with separated roadways for traffic in opposite directions.

101.28-EASEMENT:

A right acquired by one party to use land belonging to another party for a specified purpose.

101.29-EMBANKMENT:

The structure of soils, soils aggregate and broken rock between the embankment foundation and the subgrade.

101.30-EMBANKMENT FOUNDATION:

The material below the original ground surface whose physical characteristics affect the support of the embankment.

101.31-EMPLOYEE:

Any person working on behalf of the project who is under the direction of the Contractor or any subcontractor.

101.32-ENGINEER:

The State Highway Engineer of the Division, or an authorized representative, limited by the scope of duties assigned.

101.33-EQUIPMENT:

All machinery and equipment, together with the necessary supplies for upkeep and maintenance, and also tools and apparatus necessary for the proper construction and acceptable completion of the work.

101.34-ESTIMATES:

The official written itemization of the value of materials in place and work performed.

101.35-EXPRESSWAY:

A divided arterial highway for through traffic with full or partial control of access and generally with grade separations at intersections.

101.36-EXTRA WORK:

An item of work not provided for in the contract as awarded, but found essential to the satisfactory completion of the Contract within its intended scope. See further [104.3](#).

101.37-FORCE ACCOUNT WORK ORDER:

An order signed by the Engineer or an authorized representative, directing additional work to be performed, with payments based on labor, materials used, equipment cost, plus specified percentages.

101.38-FREEWAY:

An expressway with full control of access.

101.39-FRONTAGE STREET OR ROAD:

A local street or road auxiliary to and located on the side of an arterial highway for service to abutting property and adjacent areas, and for control of access.

101.40**101.40-HIGHWAY:**

The entire improvement comprising the entire right-of-way. See [101.70](#).

101.41-HIGHWAY GRADE SEPARATION:

Any structure carrying highway or street traffic over or under another highway or street.

101.42-HOLIDAYS:

Official holidays are New Year's Day, Martin Luther King, Jr. Day, Lincoln's Birthday, Washington's Birthday, Memorial Day, West Virginia Day, Independence Day, Labor Day, Columbus Day, Veteran's Day, Thanksgiving Day, Christmas Day, and any day in which an election (Primary or General) is held through the State and such other days as the President, Governor, or other duly constituted authority shall proclaim to be holidays. If a holiday falls of Sunday, the following Monday shall be observed in lieu thereof. If a holiday falls on a Saturday, the previous Friday shall be observed in lieu thereof.

101.43-INSPECTOR:

The Engineer's authorized representative assigned to make any or all necessary inspection of the work as further described in [105.10](#).

101.44-INSTRUCTIONS TO BIDDERS:

The notice to Contractors containing all necessary information as to provisions, requirements, date and time of submitting Proposals.

101.45-INVITATION FOR BIDS:

The advertisement for bids, as required by law, inviting bids for work to be performed or material to be furnished.

101.46-ITEM:

A specifically described unit of work for which a price is provided in the contract.

101.47-LABORATORY:

The testing laboratories of the Division or any other testing laboratory designated by the Division.

101.48-LOT:

A lot is an isolated quantity of specified material from a single source or a measured amount of specified construction assumed to be produced by the same process.

101.49-MATERIALS:

Any substances specified for use in the construction of the project and its appurtenances.

101.50-MATERIALS PROCEDURE:

A procedure defining standard methods or guidelines for the inspection, sampling, testing, evaluation, and documentation of the Material's Division activities relative to the quality assurance program for materials, products, and processes. Each Materials Procedure is identified by the letters MP followed by seven digits, (i.e. MP XXX.XX.XX).

101.51-MEDIAN:

The portion of a divided highway separating the traveled ways for traffic in opposite directions.

101.52-MEDIAN LANE:

A speed-change lane within the median to accommodate left-turning vehicles.

101.53-MULTIPLE DEFICIENCY:

A multiple deficiency is defined as a failure to meet specified requirements involving more than one characteristic of a material within the same lot.

101.54-NOTICE TO PROCEED:

Written notice to the Contractor to proceed with the contract work including, when applicable, the date of beginning of contract time.

101.55-PARKING LANE:

An auxiliary lane primarily for the purpose of vehicular parking.

101.56-PARKWAY:

An arterial highway for non-commercial traffic, with full or partial control of access, and usually located within a park or a ribbon of parklike development.

101.57-PAVEMENT STRUCTURE:

The combination of subbase, base course, and surface course placed on a subgrade to support the traffic load and distribute it to the roadbed.

101.58-PLANS:

The approved Plans, profiles, typical cross sections, working drawings, standard drawings, and supplemental drawings, or exact reproductions thereof, which show the location, character, dimensions and details of the work to be done.

101.59-PRE-CONSTRUCTION CONFERENCE:

A conference normally called by the District Engineer, following award and prior to start of construction, to be attended by Division officials and by the responsible officials of the Contractor and other affected parties.

101.60**101.60-PRE-QUALIFICATION STATEMENT:**

The approved form or forms upon which Contractors shall furnish information as to their ability to perform work, their experience, personnel, equipment and financial condition.

101.61-PROFILE GRADE:

The trace of a vertical plane intersecting the top surface of the proposed wearing surface, usually along the longitudinal centerline of the roadway. Profile grade means either elevation or gradient of such trace according to the context.

101.62-PROJECT:

The specific section of the highway, together with all appurtenances and construction to be performed, under the Contract.

101.63-PROJECT ENGINEER OR PROJECT SUPERVISOR:

The representative of the Engineer on a project. See further [105.9](#).

101.64-PROPOSAL:

The offer of a bidder, on the prescribed form, to perform the work and to furnish the labor and material at the prices quoted.

101.65-PROPOSAL FORM:

The approved form on which the Division requires a bid to be prepared and submitted for the work.

101.66-PROPOSAL GUARANTY:

The security furnished with a bid to guarantee that the bidder will enter into the Contract if their bid is accepted.

101.67-RAILWAY-HIGHWAY SEPARATION:

Any structure carrying highway traffic over or under the tracks of any railway.

101.68-RAMP:

A connecting roadway between two intersecting highways, usually at a highway grade separation.

101.69-RIGHT-OF-WAY:

A general term denoting land, property, or interest, usually in a strip, acquired for or devoted to a highway.

101.70-ROAD:

A general term denoting a public way for purposes of vehicular travel, including the entire area within the right-of-way, or needed for the maintenance of travel. See West Virginia Code, Chapter 17, Article 1, Section 3.

101.71-ROADBED:

The grade portion of a highway, within top and side slopes, prepared as a foundation for the pavement structure and shoulders.

101.72-ROADSIDE:

A general term denoting the area adjoining the outer edge of the roadway. Extensive areas between the roadways of a divided highway may also be considered roadside.

101.73-ROADSIDE DEVELOPMENT:

Those items necessary to the complete highway which provide for the preservation of landscape materials and features; the rehabilitation and protection against erosion of all areas disturbed by construction through seeding, sodding, mulching and the placing of other ground covers; such suitable planting and other improvements as may increase the effectiveness and enhance the appearance of the highway.

101.74-ROADWAY:

The portion of the highway within limits of construction.

101.75-SEASONAL RESTRICTIONS:

Limitations imposed on the work which prohibit the Contractor from performing certain types of work during specific seasons of the year.

101.76-SHOULDERS:

The portion of the roadway contiguous with the traveled way for accommodation of stopped vehicles, for emergency use, and for lateral support of base and surface courses.

101.77-SIDEWALK:

That portion of the roadway primarily intended for the use of pedestrians.

101.78-SINGLE DEFICIENCY:

A single deficiency is defined as a failure to meet specified requirements involving one characteristic of a material.

101.79-SPECIAL PROVISIONS:

Additions and revisions to the Standard and Supplemental Specifications covering conditions peculiar to an individual project.

101.80-SPECIFICATIONS:

101.81

A general term applied to all directions, provisions, and requirements pertaining to performance of the work.

101.81-STATE:

The State of West Virginia.

101.82-STREET:

A general term denoting a public way for purposes of vehicular travel, including the entire area within the right-of-way.

101.83-STRUCTURES:

Bridges, culverts, catch basins, drop inlets, retaining walls, cribbing, manholes, endwalls, buildings, sewers, service pipes, underdrains, foundation drains, and other features which may be encountered in the work and not otherwise classed.

101.84-SUBBASE:

The layer or layers of specified or selected materials of designed thickness placed on a subgrade to support a base course.

101.85-SUBCONTRACTOR:

An individual, firm, or corporation to whom the Contractor sublets part of the Contract.

101.86-SUBGRADE:

The upper portion of a roadbed upon which the pavement structure and shoulders are constructed.

101.87-SUBSTRUCTURE:

All that part of the structure below the bearings of simple and continuous spans, skewbacks of arches and tops of footings of rigid frames, together with the backwalls, wingwalls, and wing protection railings.

101.88-SUPERINTENDENT:

The Contractor's authorized representative in responsible charge of the work.

101.89-SUPERSTRUCTURE:

The entire structure except the substructure.

101.90-SUPPLEMENTAL AGREEMENT:

A modification of the Contract covering changes in the Plans or quantities, or both, and establishing the basis of payment and time adjustment for the work necessitated by reason of the modification, requiring the signature of the Commissioner, the Contractor, and the Surety, or their authorized representatives.

101.91-SUPPLEMENTAL SPECIFICATIONS:

Additions to and revisions of the Standard Specifications that are approved

subsequent to issuance of the printed book. Supplemental Specifications prevail over Standard Specifications when in conflict therewith.

101.92-SURETY:

The corporation, partnership, or individual, other than the Contractor, executing a bond furnished by the Contractor.

101.93-TEMPORARY STRUCTURE:

A structure required for the use of traffic or other purpose while construction is in progress and not to be retained as a part of the improvement.

101.94-TITLES:

The titles or headings of the sections and subsections are intended for convenience of reference and shall not be considered as having any bearing on their interpretation except those titles and headings used in conjunction with the definition of terms.

101.95-TRAFFIC LANE:

The portion of the roadway for the movement of a single line of vehicles.

101.96-TRAVELED WAY:

The portion of the roadway for the movement of vehicles, exclusive of shoulders and auxiliary lanes.

101.97-WORK:

Work shall mean the furnishing of all labor, materials, equipment, and other incidentals necessary or convenient to the successful completion of the project and the carrying out of all duties and obligations imposed by the contract.

101.98-WORKING DAY:

Every day shown on the calendar, exclusive of Saturdays, Sundays, and Holidays as set forth in [101.42](#), on which weather and other conditions not under the control of the Contractor will permit construction operations to proceed for a minimum of five hours with normal working forces engaged in performing the controlling item or items of work.

101.99-WORKING DRAWINGS:

Stress sheets, shop drawings, erection plans, falsework plans, framework plans, cofferdam plans, bending diagrams for reinforcing steel, or any other supplemental plans or similar data which the Contractor is required to submit to the Engineer for approval.

101.100**101.100-WORK ORDER:**

A written order, signed by the Engineer, requiring certain performance by the Contractor without negotiation. Such order shall not change quantities of major items beyond the 25 percent limitations, shall not create new items, nor make revisions to item prices.

101.101-INTERPRETATIONS:

In order to avoid cumbersome and confusing repetition of expressions in these Specifications, it is provided that whenever anything is, or is to be done, if, as, or, when, or where "contemplated, required, determined, directed, specified, authorized, ordered, given, designated, indicated, considered necessary, deemed necessary, permitted, reserved, suspended, established, approval, approved, disapproved, acceptable, unacceptable, suitable, accepted, satisfactory, unsatisfactory, sufficient, insufficient, rejected, or condemned," it shall be understood as if the expression were followed by the words "by the Engineer" or "to the Engineer".

SECTION 102**BIDDING REQUIREMENTS AND CONDITIONS****102.1-PREQUALIFICATION OF BIDDERS:**

All bidders on projects let to contract by the Division shall be prequalified as provided for by rules or regulations, or both, of the Commissioner. A Certificate of Qualification will be issued by the Commissioner fixing the amount of incomplete work a Contractor may have under contract at any one time and the type of work for which the Contractor is qualified.

To obtain a Certificate of Qualification, the Contractor must file a "Contractor's Prequalification Statement" containing the information as required based on the category of work for which prequalification is being requested.

Application for qualification will be accepted by the Commissioner until 15 calendar days prior to the date set for receiving bids on projects on which the applicant may wish to submit a Proposal. Award of a certificate may be held in abeyance until such time as the Commissioner is able to verify all references and be satisfied as to the applicant's qualifications.

No Contractor will be issued a Certificate of Qualification until the Division has had adequate time to review and verify the adequacy of the information provided in the "Contractor's Prequalification Statement".

102.2-CONTENTS OF PROPOSAL FORMS:

The proposal forms will show the location and description of the proposed work, the approximate estimates of the various quantities of work to be performed for materials to be furnished, the amount of the proposal guaranty, the number of working days or date on which the work is to be completed, and the date, time and place of opening of proposals. The form will also include any special provisions or requirements not contained in the Standard

Specifications. All papers bound with or attached to the proposal form are considered a part thereof and must not be detached or altered.

The Plans, Specifications, and other documents designated in the proposal form are considered a part of the proposal form whether attached or not attached.

Upon request, the Division will furnish prequalified bidders or their authorized representatives with proposal forms. Proposals issued for informational purposes, available to all interested parties, will be marked "Not Valid for Bidding Purposes" and will not be accepted as a bid from any company.

102.3-ISSUANCE OF PROPOSAL FORMS:

Proposal forms, on which the name of the bidder is to be typed or written in ink before issuance, will be issued to Prequalified Contractors only or to their authorized representatives, or to Contractors who have filed on a Division standard form an application for prequalification 15 calendar days prior to the date set for receiving bids on projects on which the applicant desires to bid.

The Division may at its discretion issue to a Contractor a Proposal requiring prequalification in excess of the amount allotted the Contractor provided it considers that this Contractor is particularly fitted by reason of their experience or equipment, or both, to perform work of this type involved in an amount exceeding their prequalification limits and further provided that the prospective bidder furnish the Division with a letter from a reputable Surety advising of their willingness to furnish bond to the Contractor for the project.

When more than one project is advertised, Proposals will be issued on as many projects as the Contractor requests, providing the Contractor is qualified as above for each individual project, but no contracts will be awarded exceeding the permissible limit of the Contractor's prequalification rating except as otherwise provided in 103.1.

102.4-INTERPRETATION OF APPROXIMATE ESTIMATES:

The quantities appearing in the proposal form are approximate only and are prepared for the comparison of bids. Payment to the Contractor will be made only for the actual quantities of work performed and accepted, or for materials furnished in accordance with the Contract. If upon completion of the construction the actual quantities show either increase or decrease, the unit bid prices offered in the Proposal will prevail except as further provided.

102.5-EXAMINATION OF PLANS, SPECIFICATIONS AND SITE OF WORK:

The bidder is required to examine carefully the Plans, Specifications, Supplemental Specifications, contract forms, and the site of the work contemplated. The submission of a bid shall be considered prima facie evidence that the bidder has made such examination and has judged for and satisfied themselves as to the character, quality, and quantity of work to be performed and material required to be furnished under the Contract.

102.6-PREPARATION OF PROPOSAL:

The bidders Proposal must be submitted on the form furnished by the Division. In lieu of using the Division's Schedule of Items, the bidder may submit a computer generated substitute schedule with the Proposal. The substitute schedule must be in a format approved in writing by the Division prior to use. The bidder must furnish a unit price or a lump sum price as called for in the Proposal, in numerical figures, for each pay item listed, except that in the case of alternates, the bid may be made on only one alternate if so desired. The bidder must also show the products of the respective unit prices and quantities in numerical figures in the column provided for that purpose and the total amount of the Proposal obtained in adding the products of the items.

All figures shall be in ink or typed. In case of discrepancy between the unit price and its extensions, the unit price will govern.

The Proposal must be signed in ink by the bidder or a qualified and authorized agent; by one or more bidders or officers of each firm represented in a joint venture; by one or more officers of a corporation duly authorized to act for and on behalf of the corporation; or by all partners or their individually qualified and authorized agents in case of a partnership.

The Proposal must contain the name and post office address of an individual bidder, the name and post office address of each individual or firm represented in a joint venture, the name and business address of a corporation and its corporate officials, or the name and post office address of each member of a partnership.

The proposal shall comply with West Virginia Contractor Licensing Act, Chapter 21, Article 11 Code of West Virginia, except that on Federal-Aid Projects a Contractor's license is not required at time of bid, but will be required before work can begin.

102.7-IRREGULAR PROPOSALS:

Proposals will be considered irregular and will be rejected for any of the following reasons:

- i. When the Proposal is on a form other than that furnished by the Division or if the form is altered. Use of a Division approved computer generated Schedule of Items shall not be considered an alteration of form or format within the meaning of these Specifications.
- ii. When there are unauthorized additions, conditional or alternate bids, or irregularities of any kind which may tend to make the Proposal incomplete, indefinite, or ambiguous as to its meaning. Also, when Division approved computer generated Schedule of Items show any alteration of format, additions or amendments not called for, errors or omissions in units of measure, or erasures.
- iii. When the bidder adds any provisions reserving the right to accept

or reject an award, or to enter into a Contract pursuant to an award. This does not exclude a bid limiting the maximum gross amount of awards acceptable to any one bidder at any one bid letting, providing that any selection of awards will be made by the Division.

- iv. When the Proposal does not contain a unit price for each pay item listed, except in the case of authorized alternate pay items.
- v. Failure to sign, properly execute or return the bid bond on the official form in the case of authorized alternate pay items.
- vi. Failure to sign, properly execute, or notarize the Proposal.
- vii. Failure to indicate a proposed goal in Section C, Item 3 of the Notice contained in the Proposal, when a Division determined goal is indicated in paragraph 5 of the Special Provision for Disadvantaged Business Enterprise Utilization.
- viii. Failure to properly acknowledge receipt of addendum(s) in accordance with Section I of the notice contained in the proposal.
- ix. Failure to show the West Virginia Contractor's License Number when required in Section H of the notice contained in the proposal.

102.8-PROPOSAL GUARANTY:

No proposal will be considered unless accompanied by a guaranty in the form of a certified or cashier's check, or bid bond, in the amount specified in the Proposal, made payable to the West Virginia Division of Highways. Bid bonds will be accepted only if executed on the official form furnished by the Division, and any Proposal accompanied by a bond executed on a copy, duplicate, or facsimile will be rejected.

102.9-DELIVERY OF PROPOSALS:

Each Proposal shall be submitted in a special envelope furnished by the Division with the Proposal. In the event of loss of the envelope, a similar one of the same general size and shape may be used. The envelope shall be endorsed on the outside "Proposal for the Improvement of the _____ Road or Bridge Number _____, Project No. _____, County _____, West Virginia." and shall have the name of the bidder thereon. Envelopes shall be addressed to The West Virginia Division of Highways, Charleston, West Virginia, and shall have the name and address of the bidder. Proposals shall be deposited at the proper designated office of the Division prior to the hour set in the Proposal for opening of bids. Proposals received after the time for opening of bids will be returned to the bidder unopened.

102.10-WITHDRAWAL OF PROPOSALS:

At any time prior to the opening of Proposals, bidders may withdraw Proposals already deposited with the Division, provided the request is made in

102.11

writing or by telegraph; provided further that any bidder may withdraw their bid during the course of reading of bids prior to the actual reading of bids on the project for which the bid is withdrawn; further provided that the requested withdrawal is made in writing in the following form:

“I, the undersigned, of _____, Contractor(s) hereby acknowledge that I have this day withdrawn the sealed bid of _____, Contractor(s) on West Virginia Division of Highways Project No. _____.”

Contractors who are found to be low bidders on a number of projects of which the total exceeds the Contractor's rating may withdraw, with the approval of the Commissioner, bids on such project or projects as will bring the remaining total to within the limit of the rating. At their discretion, the Commissioner may award contracts for the project or projects on which bids have been so withdrawn to the next lowest qualified bidder.

102.11-COMBINATION PROPOSALS:

If the Division so elects, Proposals may be issued for projects in combination or separately, so that bids may be submitted either on the combination or on separate units of the combination. The Division reserves the right to make awards on combination bids or separate bids to the best advantage of the Division. No combination bids other than those specifically set up in proposals by the Division will be considered. Separate Contracts will be written for each individual project included in the combination.

102.12-PUBLIC OPENING OF PROPOSALS:

Proposals will be opened and read publicly at the time and place indicated in the notice to Contractors. Bidders, their authorized agents, and other interested parties are invited to be present.

102.13-DISQUALIFICATION OF BIDDERS:

Either of the following reasons may be considered as being sufficient for the disqualification of a bidder and the rejection of their Proposal or Proposals.

- i. More than one Proposal for the same work from an individual, firm, or corporation under the same or different name.
- ii. Evidence of collusion among bidders. Participants in such collusion will receive no recognition as bidders for any future work of the Division until any such participant shall have been reinstated as a qualified bidder.

102.14-MATERIAL GUARANTY:

The successful bidder shall furnish a complete statement of the origin, composition and manufacture of all materials to be used in the construction of the work, together with samples when required. Samples may be subjected to the tests provided for in these Specifications to determine their quality and fitness for the work.

102.15-FREE COMPETITIVE BIDDING AFFIDAVIT:

Prior to the approval of Federal-Aid Contracts, a sworn statement in the form of an affidavit shall be executed by, or on behalf of, the person, firm, association, or corporation to whom such contract is to be awarded. This affidavit must be sworn to before a Notary Public who must affix their seal thereto if outside the State of West Virginia.

The affidavit, with accompanying endorsement and acknowledgment sections, is contained in the contract Proposal.

102.16-PRE-CONSTRUCTION DATA:

Prospective bidders may review files at the West Virginia Division of Highways, Capitol Complex, Charleston, West Virginia. These files may contain additional information not included in the contract documents including, but not limited to, old plans, old shop drawings, geotechnical information, environmental documents, permit applications, permits, asbestos reports, hazardous waste reports and other data. Copies may be obtained upon request and payment of printing fees.

SECTION 103

AWARD AND EXECUTION OF CONTRACT

103.1-CONSIDERATION OF PROPOSALS:

After the Proposals are opened and read, they will be compared on the basis of the summation of the products of the approximate quantities shown in the bid schedule by the unit bid prices. The results of such comparisons will be made immediately available to the public. In the event of discrepancy between unit bid prices and extensions, the unit bid price shall govern.

The right is reserved to reject any or all proposals, to waive technicalities or to advertise for new proposals if, in the judgment of the Commissioner, the best interests of the State will be promoted.

If Proposals for more than one project are issued to a bidder, which projects individually would be within the bidder's qualification established provided in 102.1, but a combination of more than one, considering also the work under contract and incomplete, would be in excess of their qualification, the right is reserved to consider only such Proposal or Proposals as, in the opinion of the Commissioner, are most advantageous to the Division.

103.2-AWARD OF CONTRACT:

The award of Contract, if it be awarded, will be made within 30 calendar days after the opening of Proposals to the lowest responsible and prequalified bidder. The Commissioner may, with the agreement of the successful bidder, withhold award for any length of time. The successful bidder will be notified by letter, mailed to the address shown on their Proposal, that their bid has been accepted and that they have been awarded the Contract.

103.3-CANCELLATION OF AWARD:

The Division reserves the right to cancel the award of any Contract at any time before the execution of the Contract documents by all parties without any liability against the Division.

103.4-RETURN OF PROPOSAL GUARANTY:

All proposal guaranties, except those of the two lowest bidders, will be returned immediately following the opening and checking of the Proposals. The retained proposal guaranty of the unsuccessful of the two lowest bidders will be returned within 10 days following the award of Contract, and that of the successful bidder will be returned after a satisfactory bond has been furnished and the Contract has been executed.

103.5-REQUIREMENT OF CONTRACT BOND:

At the time of the execution of the Contract, the successful bidder shall execute and deliver to the Division a good and sufficient surety or collateral bond payable to the State of West Virginia in the amount of 100 percent of the contract price.

As an alternate, the successful bidder may deposit with the State Treasurer cash bond, United States treasury bonds, United States treasury notes, United States Treasury certificates of Indebtedness, United States treasury bills or West Virginia Road Bonds in the amount of 100 percent of the contract amount. A safe keeping receipt from a bank located in the State of West Virginia may be deposited with the State Treasurer in lieu of any of the definitive securities.

The State Treasurer shall, on a regular basis, collect all interest or income on the obligations so deposited and shall pay same, when and if collected, to the Contractor who deposited the obligations. If the deposit is in the form of coupon bonds, the State Treasurer shall deliver each coupon as it matures to the Contractor.

103.6-INSURANCE REQUIREMENTS:

The Contractor shall be required, in addition to any other form of insurance or bonds required under the terms of the Contract and Specifications, to procure and maintain during the life of the Contract the following types of insurance in the amounts set forth:

All such policies of insurance shall be occurrence policies and the Certificate of Insurance provided to the Division shall so specify. The policies must provide coverage for all damages arising out of injury to persons or property which allegedly occurred during the life of the contract regardless of when the claim is filed subject to statute of limitations.

103.6.1-Contractor's Public Liability and Property Damage Liability Insurance: The Contractor shall furnish an ACORD Form 25-S or its equivalent as evidence of insurance with a 30-day notice of cancellation

provision that the contractor has in place, an Insurance Devices Office (CGL) Commercial General Liability Insurance Form CG0001, 01-96 issue date or later. The limits of insurance required by the Division for contractor are as follows:

General Aggregate	\$2,000,000
Products/Completed Operations Aggregate	\$2,000,000
Personal & Advertising Injury	\$1,000,000
Each Occurrence	\$1,000,000
Fire Damage	\$50,000
Medical Expense Limit	\$5,000

The CGL policy issued on behalf of the Contractor shall not include exclusions for blasting, collapse, or underground liability. The CGL policy issued for the Contractor shall include endorsements that extend the aggregate limits of insurance to each construction project separately.

103.6.2-Contractor's Protective Public Liability and Property Damage Liability Insurance: The Contractor shall furnish evidence to the State that, with respect to the operations performed for them by subcontractors, the Contractor carries in their own behalf (1) regular Contractor's Protective Public Liability Insurance providing for a limit of not less than \$250,000 for all damages arising out of bodily injuries to or death of one person and subject to that limit for each person, a total limit of \$500,000 for all damages arising out of bodily injuries to or death of two or more persons in any one accident; and (2) regular Contractor's Protective Property Damage Liability Insurance providing for a limit of not less than \$100,000 for all damages arising out of injury to or destruction of property in any one accident and, subject to that limit per accident, a total (or aggregate) limit of \$500,000 for all damages arising out of injury to or destruction of property during the life of the Contract. The policy shall be written or endorsed to cover the hazards of blasting, operation of mechanical equipment on streets and highways, and collapse.

The contractor shall also give evidence of insurance for Employer's Liability Insurance, with a 30-day notice of cancellation. The Employer's Liability policy must include coverage to protect the contractor for claims brought under Section 23-4-2 of West Virginia Code. The limits of insurance under this section shall be as follows:

Each accident	\$500,000
Each disease	\$500,000
Each disease/employee	\$500,000

Evidence of this coverage can be set forth on the ACORD 24-S specified in Subsection [103.6.1](#).

103.6.3

103.6.3-Automobile Insurance: The Contractor shall furnish evidence, with a 30-day notice of cancellation, to the state that it maintains an Insurance Services Office Commercial Automobile Liability insurance policy Form CA0001 or its equivalent. The policy shall include coverage for owned, non-owned, and hired vehicles.

The limits for liability insurance must be at least \$1,000,000 combined single limit. Evidence for the coverage shall be set forth on an ACORD Form 25-S Certificate of Liability Insurance.

103.6.4-Steam Boiler Insurance: In event steam boilers are used on the work, the Contractor shall furnish evidence that the Contractor carries in their own behalf standard Steam Boiler Insurance having an aggregate limit of not less than \$250,000.

The insurance specified shall be carried until all work required to be performed under the terms of the Contract is satisfactorily completed as evidenced by the formal acceptance of the State.

103.6.5-Countersignature of Resident West Virginia Agent: The policy or policies of Insurance required must be countersigned by a Resident Agent of the State of West Virginia, in accordance with the applicable statute of the State of West Virginia.

All certificates of insurance used to verify the policies issued must be endorsed by a West Virginia Licensed Resident Agent. Such endorsement must include the printed name, street address, city and zip code of the Resident Agent.

103.7-SPECIAL BONDS AND INSURANCE:

When the work is of such nature that special bond or insurance is required, the special requirements will be detailed and included in the Proposal for the project. This coverage could include, but not be limited to, builder's risk, installation floater, maritime exposures, environmental exposures, and professional liability.

103.8-EXECUTION OF CONTRACT:

The Contract shall be executed by the bidder to whom the Contract has been awarded, the bond executed by the principal and the sureties, and the Contract and bond returned to the Division within 20 days after the date of the notice of the award.

103.9-FAILURE TO EXECUTE CONTRACT:

Failure by the bidder to execute the Contract and file acceptable bond within 20 days after notice of award shall be just cause for the annulment of the award; and it is understood by the bidder, in the event of such an annulment of award or the Contract, that the amount of the guaranty deposited with the Proposal will be retained by the Division and deposited in the Division of Highways Fund, not as a penalty, but as liquidated damages. Award may then

be made to the next lowest responsible bidder, or the work may be readvertised and constructed under contract or otherwise, as the Division may decide.

103.10-PRECONSTRUCTION CONFERENCE:

As soon as possible after the award of each Contract a preconstruction conference will be arranged by the Division. The Contractor, their superintendent, or an authorized agent shall be present at the conference and shall present the proposed schedule of work, list of proposed subcontractors, if any, and a list of suppliers from whom materials are anticipated to be purchased. The information so presented shall be on forms submitted to the Contractor with the letter of contract award. The Division will make arrangements for utility representatives to be present.

SECTION 104 SCOPE OF WORK

104.1-INTENT OF CONTRACT:

The intent of the Contract is to provide for the construction and completion in every detail of the work described. The Contractor shall furnish all labor, materials, equipment, tools, transportation, and supplies required to complete the work in accordance with the Plans, Specifications, and terms of the Contract.

Should any misunderstanding arise as to the intent or meaning of the Contract, or any discrepancy appear, the decision of the Commissioner shall be final.

104.2-ALTERATION OF PLANS OR CHARACTER OF WORK:

Under no circumstances shall alterations of Plans or the nature of the work involve work beyond the termini of the proposed construction except as may be necessary to satisfactorily complete the project.

In addition to the above, alterations in Plans or increased quantities of items may be made necessary at a time when the contract or the items involved in the operations are substantially completed, the related contractor organization demobilized, and related equipment essentially removed from the project.

Under these circumstances, if it is demonstrated that the unit cost to the Contractor has increased, additional compensation may be allowed by the Engineer and the additional work performed as prescribed in 104.3 as "Extra Work."

Any adjustment in compensation because of a change(s) resulting from one or more of the conditions described above will be made in accordance with the provisions of 109.3. Any adjustment in contract time because of such change(s) will be made in accordance with the provisions of 108.6.

104.3-EXTRA WORK:

The Contractor shall perform unforeseen work for which there is no price included in the Contract, whenever it is deemed necessary or desirable in order

104.4

to complete fully the work as contemplated. The work shall be performed in accordance with the Specifications and as directed, and will be paid for as provided by a written supplemental agreement on a unit price or lump sum basis. In the event the Engineer and the Contractor are unable to agree upon the terms of the supplemental agreement, the Contractor shall proceed with the work and receive payment therefore in the manner and amount prescribed in 109.4.

104.4-TEMPORARY STRUCTURES:

In contracts for bridges only, the Contractor will not be required to construct or maintain temporary structures unless the construction and maintenance of such structures are stipulated in the Contract or ordered as extra work by the Engineer. If the building of temporary structures is included in the Contract, or added by extra work order, the responsibility of the Contractor for accidents to the public or to their employees, arising from their construction or maintenance, shall extend to such structure and its roadway approaches.

104.5-MAINTENANCE OF TRAFFIC:

The Project, while undergoing improvement, shall be kept open to all traffic by the Contractor in such condition that both local and through traffic will be adequately and safely accommodated. All construction operations shall be scheduled to keep traffic delay to a minimum. The Division has adopted, and the Contractor shall follow the Standard, "Traffic Control for Street and Highway Construction and Maintenance Operations," published by the West Virginia Division of Highways.

All expenses for the following items shall be borne by the Contractor without extra compensation except when the Proposal provides for payment under 636, Maintaining Traffic:

- i. The construction and maintenance of temporary detours, temporary structures, temporary approaches, crossings and intersections with streets and roads, including the furnishing and application of aggregates for maintenance of traffic and liquid asphalt oil, calcium chloride, or water for use as dust palliative.
- ii. The furnishing of flaggers and pilot trucks and drivers.
- iii. The furnishing, erection, and maintenance of warning devices, such as signs, auxiliary barriers, channelizing devices, hazard warning lights, barricades, flares and reflective markers.

If actual field conditions are not illustrated in the Plans, engineering judgment and discretion shall be exercised to select devices that will be adaptable, but the general policies prescribed shall be adhered to. Final responsibility for the installation of adequate safety devices for the protection of the traveling public and employees, as well as for the safeguard of the work in general, shall rest with the Contractor.

During any suspension of work, the Contractor shall make passable and shall

open to traffic such portions of the project and temporary roadways or portions thereof as may be agreed upon between the Contractor and the Engineer for the temporary accommodation of necessary traffic during the anticipated period of suspension. Thereafter, and until an issuance of an order for the resumption of construction operations, the maintenance of the temporary route or line of travel agreed upon will be by and at the expense of the Division. When work is resumed, the Contractor shall replace or renew any work or materials lost or damaged because of such temporary use of the project and shall remove, to the extent directed by the Engineer, any work or materials used in temporary maintenance thereof by the Division and shall complete the project in every respect as though its prosecution had been continuous and without interference. All additional work caused by such suspensions, for reasons beyond the control of the Contractor, will be paid for by the Division at contract prices or by extra work.

The Division will provide all necessary snow removal.

104.6-RIGHTS IN AND USE OF MATERIALS FOUND ON THE WORK:

The Contractor, with the approval of the Engineer, may use on the project such stone, gravel, sand, or other material determined suitable by the Engineer, as may be found in the excavation and will be paid both for the excavation of such materials at the corresponding contract unit price and for the pay item for which the excavated material is used. The Contractor shall replace at their own expense with other acceptable material all of that portion of the excavation material so removed and used which was needed for use in the embankments, backfills, approaches, or otherwise. No charge for the material so used will be made against the Contractor. The Contractor shall not excavate or remove any material from within the highway location which is not within the grading limits, as indicated by the slope and grade lines, without written authorization from the Engineer.

Unless otherwise provided in the Contract, the material from any existing old structures and pipes shall become the property of the Contractor and shall be removed from the project.

104.7-FINAL CLEAN UP:

Before final acceptance is made, the Contractor shall clear the highway, waste areas, borrow pits, and all ground occupied by the Contractor during the construction, of all rubbish, excess materials, temporary structures and equipment. The Contractor shall restore in an acceptable manner all property, both public and private, which has been damaged during the prosecution of the work; and shall leave the highway or bridge site, including streams and their banks, in a neat and presentable condition in accordance with applicable laws of the State. All excavated material or falsework placed in stream channels shall be removed, and all material from around piers and abutments shall be replaced and compacted to the level of the original surface.

104.8

104.8-BRIDGE PLATE:

A bronze plate, carrying the project number, the number of the bridge, and the year of the bridge construction, will be furnished and placed by the Contractor without extra compensation. The nameplate on through steel bridges shall be placed on the end posts about eight feet (2.5 meters) vertically above the floor. On other bridges, they shall be placed in the railings as shown on the plans or as designated by the Engineer. The plate shall be a minimum of 8 in. by 10 in. (200 by 250 mm) wide, with letters and numbers of ¾ in. (20 mm) minimum height raised ⅛ in. (3 mm) above the surface of the plate. The information on the plate shall be arranged as follows:

(Project No. on first line)

BRIDGE No. _____

BUILT (Year of construction) _____

104.9 - DIFFERING SITE CONDITIONS:

During the progress of the work, if subsurface or latent physical conditions are encountered at the site differing materially from those indicated in the contract or if unknown physical conditions of an unusual nature, differing materially from those ordinarily encountered and generally recognized as inherent in the work provided for the contract, are encountered at the site, the party discovering such conditions shall promptly notify the other party in writing of the specific differing conditions before they are disturbed and before the affected work is performed.

Upon written notification, the Engineer will investigate the conditions, and if the Engineer determines that the conditions materially differ and cause an increase or decrease in the cost or time required for the performance of any work under the contract, an adjustment, excluding loss of anticipated profits, will be made and the contract modified in writing accordingly. The Engineer will notify the Contractor of their determination whether or not an adjustment of the contract is warranted.

No contract adjustment which results in a benefit to the Contractor will be allowed unless the Contractor has provided the required written notice.

The Contractor shall promptly notify the Engineer of alleged changes to the Contract due to differing site conditions, extra work, altered work beyond the scope of the Contract, or action(s) taken by the Division that changed the Contract terms and conditions.

- A. No further work is to be performed or Contract item expense incurred with relation to the claimed change after the date the change allegedly occurred unless directed otherwise in writing or orally follow up in writing in 48 hours by the Engineer.
- B. Immediately notify the Engineer verbally of the alleged change or extra work occasioned by site conditions or actions by the Division, and in writing within five calendar days of the date the

alleged change or action was noted. Thereafter, the Contractor shall provide the following information to the Engineer in writing within 15 calendar days of the written notice.

1. The date of occurrence and the nature and circumstances of the occurrence that constitute a change.
 2. Name, title, and activity of each Division representative knowledgeable of the claimed change.
 3. Identify any documents and the substance of any oral communication involved in the claimed change.
 4. Basis for a claim of accelerated schedule performance.
 5. Basis for a claim that the work is not required by the Contract.
 6. Particular elements of Contract performance for which additional compensation may be sought under this Section including:
 - a. Pay item(s) that has been or may be affected by the claimed change.
 - b. Labor or materials, or both, that will be added, deleted, or wasted by the claimed change and what equipment will be idled or required.
 - c. Delay and disruption in the manner and sequence of performance that has been or will be caused.
 - d. Adjustments to Contract price(s), delivery schedule(s), staging, and Contract time estimated due to the claimed change.
 - e. Estimate of the time within which the Department must respond to the notice to minimize cost, delay, or disruption of performance.
- C. Following submission of the notification to the Engineer, and in the absence of directions received to the contrary from an authorized representative of the Division, the Contractor shall continue diligent prosecution of the work under the Contract to the maximum extent possible.

104.10

Within 15 calendar days after receipt of the written notice and required information, the Engineer shall respond in writing to the Contractor to:

1. Confirm that a change occurred and, when necessary, direct the method and manner of further performance, or
2. Deny that a change occurred and, when necessary, direct the method and manner of further performance, or
3. Advise the Contractor that adequate information has not been submitted to decide whether (1) or (2) applies, and indicate the needed information and date it is to be received by the Engineer for further review. The Division will respond to such additional information within 15 calendar days of receipt from the Contractor.

104.10 - SUSPENSION OF WORK ORDERED BY THE ENGINEER:

If the performance of all or any portion of the work is suspended or delayed by the Engineer in writing for an unreasonable period of time (not originally anticipated, customary or inherent in the construction industry) and the Contractor believes that additional compensation and/or contract time is due as a result of such suspension or delay, the Contractor shall submit to the Engineer in writing a request for adjustment within seven (7) calendar days of receipt of the notice to resume work. The request shall set forth the reasons and support for such adjustment.

Upon receipt, the Engineer will evaluate the Contractor's request. If the Engineer agrees that the cost and/or time required for the performance of the contract has increased as a result of such suspension and the suspension was caused by conditions beyond the control of and not the fault of the Contractor, its suppliers, or subcontractors at any approved tier, and not caused by weather, the Engineer will make an adjustment (excluding profit) and modify the contract in writing accordingly. The Contractor will be notified of the Engineer's determination whether or not an adjustment of the contract is warranted.

No contract adjustment will be allowed unless the Contractor has submitted the request for adjustment within the time prescribed.

No contract adjustment will be allowed under this clause to the extent that performance would have been suspended or delayed by any other cause, or for which an adjustment is provided or excluded under any other term or condition of this contract.

104.11 - SIGNIFICANT CHANGES IN THE CHARACTER OF WORK:

The Engineer reserves the right to make, in writing, at any time during the work, such changes in quantities and such alterations in the work as are

necessary to satisfactorily complete the project. Such changes in quantities and alterations shall not invalidate the contract nor release the surety, and the Contractor agrees to perform the work as altered.

If the alterations or changes in quantities significantly change the character of the work under the contract, whether such alterations or changes are in themselves significant changes to the character of the work or by affecting other work cause such other work to become significantly different in character, an adjustment, excluding anticipated profit, will be made to the contract. The basis for the adjustment shall be agreed upon prior to the performance of the work. If a basis cannot be agreed upon, then an adjustment will be made either for or against the Contractor in such amount as the Engineer may determine to be fair and equitable.

If the alterations or changes in quantities do not significantly change the character of the work to be performed under the contract, the altered work will be paid for as provided elsewhere in the contract.

The term "significant change" shall be construed to apply only to the following circumstances:

- a) When the character of the work as altered differs materially in kind or nature from that involved or included in the original proposed construction; or
- b) When a major item of work, (any item having an original contract value in excess of 10 percent of the original contract amount or \$50,000 dollars), is increased in excess of 125 percent or decreased below 75 percent of the original contract quantity. Any allowance for an increase in quantity shall apply only to that portion in excess of 125 percent of original contract item quantity, or in case of a decrease below 75 percent, to the actual amount of work performed.

104.12 - VALUE ENGINEERING:

The Contractor may submit to the Engineer, in writing, Value Engineering Proposals (VEP) for modifying the plans, specifications or other requirements of the contract for the purpose of reducing the total cost of construction without reducing design capacity or quality of the finished product. If accepted by the Division, net savings resulting from the VEP will be shared by the Contractor and the Division on a fifty-fifty basis.

This subsection applies to all VEPs initiated and developed by the Contractor and which are identified as such by the Contractor at the time of their submission to the Engineer; however, nothing shall be construed as requiring the Engineer to consider or approve a VEP submitted hereunder.

As a minimum, the following information shall be submitted, in quadruplicate, with each VEP:

- i. a statement that this proposal is submitted as a VEP;
- ii. a description of the difference between the existing contract requirements and the proposed change;
- iii. a statement concerning the basis for the VEP and benefits to the Division together with an itemization of the contract items and

104.12

- requirements affected by the VEP;
- iv. separate detailed cost estimates for both the existing contract requirements and the proposed change;
- v. an itemization of plan details, design standards or specifications to be changed if the VEP is adopted;
- vi. an estimate of the effect on collateral costs to the Division. Collateral costs are defined to be reduced costs of operation, maintenance or repair and extended useful service life; and
- vii. a statement of the time by which approval must be issued to obtain the total cost reduction during remainder of Contract, noting any effect on contract completion time or delivery schedule.

The Division will process the VEP in the same manner as prescribed for any other proposal which would necessitate issuance of a Contract change order. The Division may accept in whole or in part any VEP by issuing a change order which will identify the VEP on which it is based. The Division will not be liable to the Contractor for failure to accept or act upon any VEP submitted pursuant to this provision nor for any delays to the work attributable to any such proposal. Until a proposal is effected by change order, the Contractor shall remain obligated to the terms and conditions of the existing contract. When an executed change order has not been issued by the date upon which the Contractor's proposal specifies that a decision should be made, or such other date as the Contractor may subsequently have specified in writing, such proposal shall be deemed rejected.

The change order effecting the necessary Contract modification will establish the estimated net savings agreed upon, will provide for adjustment in the Contract prices and will indicate the net savings be equally divided between the Contractor and the Division. The Contractor shall absorb all costs incurred in preparing a VEP for submission to the Division. All reasonably incurred costs of reviewing and administering the VEP will be borne by the Division. The Division reserves the right to include in the change order any conditions it deems appropriate for consideration, approval and implementation of the proposal. The Contractor's fifty-percent share of the net savings shall constitute full compensation for effecting all changes pursuant to the change order.

Acceptance of the VEP and performance of the work thereunder will not change the Contract completion date as a result of the VEP, unless specifically provided for in the change order authorizing the VEP.

The Division expressly reserves the right to adopt a VEP for general use in contracts administered by the Division when it determines the VEP is suitable for application to other contracts without obligation or compensation of any kind to the Contractor.

Proposed changes in the basic design of a bridge or pavement type, or which require different right-of-way limits, will not normally be considered as an acceptable VEP.

The Engineer shall be sole judge of the acceptability of a VEP.

When a VEP is accepted by the Division, the provisions of [104.2](#) pertaining

to adjustment of Contract unit price due to alterations of Contract quantities will not apply to the items adjusted or deleted as a result of effecting the VEP by change order.

The cost of the revised work, as determined in the value engineering change order, will be paid on current estimates.

In addition to such payment, the Contractor will be paid, on a Lump Sum basis by a separate item, one half of the difference (net savings) of the cost of the original contract work and the final cost of the new work listed in the change order.

One fourth of the estimated net savings will be paid to the Contractor upon approval of the change order. The remainder of the net savings due the Contractor will be paid upon completion of all items of work included in the change order. This final Lump Sum payment will be determined by the actual quantities for items paid by the unit. Final payment for other lump sum or proposal quantity items will be the change order amount, subject to [109.2](#).

104.13 - FUNDING SOURCE IDENTIFICATION SIGNS:

104.13.1 - General:

Funding Source Identification Signs shall be furnished by the Contractor if the Total Contract Bid Amount of the construction exceeds \$500,000 or otherwise noted on the plans, and shall be erected during mobilization of the project. The cost of furnishing, erecting, maintaining, and removal of these signs shall be incidental to the cost of construction of the project.

104.13.2 – Location:

Funding Source Identification Signs shall be located as directed by the Engineer. The Contractor shall promptly remove each sign at the completion of the project for which the sign was erected.

104.13.3 - Sign Content:

The content of each sign and the size of letters and the size of board shall be as required by the Engineer. The funding agencies and the dollar amounts involved will be furnished to the Contractor by the Engineer.

104.13.4 - Sign Construction:

The materials for Funding Source Identification Signs, such as for the sign panels, their supports, and for the legend and background, are to be of a type and method of fabrication that will be consistent with the conditions and estimated period of use. Signs shall have black letters for the legend on a white background. Reflective sheeting will be permitted, but not required. Mounting, transverse location, height, and similar features for Funding Source Identification Signs shall be consistent with practices used for the installation of other informational signs either on wooden or steel U-channel supports to comply with small sign support safety practices. The sign shall be mounted as directed by the Engineer.

SECTION 105 CONTROL OF WORK

105.1-AUTHORITY OF THE ENGINEER:

The Engineer will decide all questions which may arise as to the quantity, quality, and acceptability of materials furnished and work performed, and as to the rate of progress of the work; all questions which may arise as to the interpretation of the Plans and Specifications; and all questions as to the acceptable fulfillment of the Contract on the part of the Contractor. The decision of the Engineer will be final.

The Engineer will have the authority to suspend the work wholly or in part due to the failure of the Contractor to correct conditions unsafe for the employees or the general public, for failure to carry out orders, for such periods as the Engineer may deem necessary due to unsuitable weather, for conditions considered unsuitable for the prosecution of the work, or for any other condition or reason deemed to be in the public interest. All such suspension orders will be directed to the Contractor in writing.

The Engineer is not authorized to increase the obligation of the Division to any Contract except as provided.

105.2-PLANS AND WORKING DRAWINGS:

Approved Plans will show the location, profile, typical cross section, structures, except as specified, incidental items, and a summary of all items appearing in the Proposal. Any deviations which may be required by the exigencies of the construction will be determined by the Engineer and authorized by the Engineer in writing. The Contractor shall keep one set of approved Plans available on the work at all times.

Plans will show such details as are necessary to give a comprehensive idea of the construction contemplated. Any information which may be shown on drawings regarding results obtained from test piles or borings will be a record of conditions encountered at the place where such test piles were driven or borings were made, as nearly as these conditions could be interpreted by the Engineer observing the operations. The Contractor shall interpret the data in the light of their own experience. The Contractor is not bound to accept or rely on the data shown on the drawings, but may make such additional borings and investigations, including test piles, as the Contractor may desire in order to satisfy themselves concerning the lengths of piles and the conditions governing or entering into the construction of foundations.

The Plans will show the foundation depths and dimensions on which the estimate of quantities is based. These depths and foundation dimensions, however, are subject to such variations as may be necessary to secure a foundation satisfactory to the Engineer, and the right is expressly reserved to increase or diminish the dimensions and depths of the foundations as the Engineer may determine.

The Contractor shall submit to the Engineer for approval such additional

stress sheets, shop details, and other working drawings as may be required for the construction of any part of the work; and prior to the approval of such plans, any work done or materials ordered shall be at the Contractor's risk.

Working drawings for steel structures shall consist of shop detail, erection and other working plans, showing details, dimensions, sizes of material, and other information necessary for complete fabrication and erection of metal work. The Division will require shop lists for structural steel to be submitted in a format as set forth by the Engineer.

Working drawings for concrete structures shall consist of such detail plans as may reasonably be required for the successful prosecution of the work and which are not included in the Plans furnished by the Engineer. These may include plans for falsework, bracing, centering and formwork, masonry layout diagrams, and diagrams for bent reinforcement.

The Contractor shall furnish the Engineer copies of the working drawing as may be required for approval and for construction purposes and upon completion of the work, reproducible, full-size tracings of the original drawings shall be delivered to the Engineer. The size of the original drawings shall be 22 inches by 36 inches (A1 metric paper), including margins, unless otherwise permitted. The working drawings submitted for approval may be reduced.

It is expressly understood that the approval by the Engineer of the Contractor's working drawing relates to the requirements for strength and general arrangement, and such approval will not relieve the Contractor from responsibility for omissions, errors in dimensions, shop fits, field connections, etc., for quantity of materials, or from any of their responsibility under the Contract for the successful completion of the work.

The Contract price shall include the cost of furnishing all working drawings, and the Contractor will be allowed no extra compensation for such drawings.

It is the Contractor's responsibility to determine the exact location of each utility in project areas where these utilities would be interrupted or damaged by performing work. In the event of damage or disruption to utilities which are active and are to remain in service, the Contractor shall immediately notify the responsible official of the organization operating the utility that is interrupted.

The Contractor shall assume all costs, charges or claims connected with the interruption and repair of any utility damaged by the Contractor.

105.3-CONFORMITY WITH PLANS AND SPECIFICATIONS:

All work performed and all materials furnished shall be in reasonably close conformity with the lines, grades, cross sections, dimensions and material requirements, including tolerances, shown on the Plans or indicated in the Specifications.

Should the Engineer determine the materials, or the finished product do not conform to the Specifications or the Plans, the Engineer will then make a determination if the work will be accepted and remain in place in accordance with 106.3.1 and 106.7. In this event, the Engineer will document the basis of acceptance by contract modification which will provide for an adjusted payment. All nonconforming material or construction judged to be inadequate

105.4

for the use intended shall be either reworked or removed and replaced at no expense to the Division.

Each supplemental agreement containing an adjusted price will also have added the sum of Two Hundred Dollars to each adjusted price, for the Divisions administration costs, to be deducted from monies due the Contractor.

105.4-COORDINATION OF PLANS, SPECIFICATIONS, SUPPLEMENTAL SPECIFICATIONS, AND SPECIAL PROVISIONS:

These Specifications, the Supplemental Specifications, the Plans, Special provisions, and all Supplementary Documents are essential parts of the Contract, and a requirement occurring in one is as binding as though occurring in all. They are intended to be complementary and to describe and provide for a complete work. In case of discrepancy, calculated dimensions will govern over scaled dimensions; Supplemental Specifications will govern over Specifications; Plans will govern over Specifications and Supplemental Specifications; Special Provisions will govern over Specifications, Supplemental Specifications and Plans. When the plans provide that new work is to connect with existing structures, the Contractor must verify all dimensions with the Engineer before proceeding with the work.

The specifications, Supplemental specifications, and Special provisions are in dual units. The first Primary unit is in English with the Metric unit following in parentheses "()". The Metric values are considered replacements for the English units and they are not conversions.

The Contractor shall take no advantage of any apparent error or omission in the Plans or Specifications. In the event the Contractor discovers such an error or omission, the Contractor shall immediately notify the Engineer. The Engineer will then make such corrections and interpretations as may be deemed necessary for fulfilling the intent of the Plans and Specifications.

105.5-COOPERATION BY CONTRACTOR:

The Contractor will be furnished a maximum of three complete sets of plan and profile sheets and three complete sets of cross sections upon request, without charge. Additional copies may be obtained upon payment of \$10.00 per set of plan and profile sheets and \$50.00 per set of cross sections. The Contractor shall maintain on the Project at all times one complete set of Plans, Specifications, and Special Provisions.

The Contractor shall give the work the constant attention necessary to facilitate the progress thereof, and shall cooperate with the Engineer, their inspectors, other Contractors, and utilities in every way possible.

The Contractor shall have on the work at all times, as an agent, a competent superintendent capable of reading and thoroughly understanding the Plans and Specifications, and thoroughly experienced in the type of work being performed, who shall receive instructions from the Engineer or an authorized representatives. The Superintendent shall have full authority to execute orders or directions of the Engineer without delay, and to promptly supply such

materials, equipment, tools, labor, and incidentals as may be required. Such superintendence shall be furnished irrespective of the amount of work sublet.

The Contractor shall furnish to the Engineer a list of addresses and telephone numbers of their personnel who may be reached in case of emergency during hours when no work is to be performed. On weekends, holidays, during suspensions of work, and during storms the Contractor shall alert certain of their personnel to stand by and shall inform the Engineer of arrangements so made.

The Contractor shall provide all reasonable facilities and furnish the Division the information, assistance and samples required by the Engineer and Inspector for proper inspecting or testing of materials and workmanship.

On some contracts it may be necessary, to insure proper coordination between the work of the Contractor and the work of various utilities, to hold a pre-construction utility meeting. The Division will arrange for the affected utilities to be present. The Contractor or their representative, authorized to make decisions for them in regard to the scheduling of the proposed work, is required to attend the meeting. A report of the pre-construction utility meeting will be prepared and distributed by the Engineer to all represented at the meeting.

105.6-COOPERATION WITH UTILITIES:

The Division will notify all utility companies, all pipe line owners, or other parties affected, and endeavor to have all necessary adjustments of the public or private utility fixtures, sewers, pipe lines, and other appurtenances within or adjacent to the limits of construction, made as soon as practicable.

Water lines, gas lines, wire lines, sewer lines, service connections, water and gas meter boxes, water and gas valve boxes, light standards, cableways, signals, and all other utility appurtenances within the limits of the proposed construction which are to be relocated or adjusted are to be moved by the owners at their expense, except as otherwise provided for in the Special Provisions or as noted on the Plans.

Should the Contractor desire temporary changes of location for their convenience of any utility appurtenances, the Contractor shall satisfy the Division that the proposed relocation does not interfere with its or other Contractors' operations or the requirements of the work and does not cause an obstruction or a hazard to traffic. The Contractor shall make their own request to the utility or other parties affected by such relocation work. Such relocation work shall be made solely at the Contractor's expense.

Any work done under or within the right-of-way of a railroad shall be under the supervision and control of the Chief Engineer, or other designated officer, of the railroad to the extent necessary in the judgment of the Chief Engineer, or other designated officer, to insure safe and uninterrupted operation of its trains and the convenient conduct of its business. Any additional conditions or requirements for doing work within the railroad right-of-way will be set forth in the Contract.

In general, it is to be understood that the Contractor has considered in their

105.7

bid all of the permanent and temporary utility appurtenances in their present or relocated positions as shown on the Plans, and that no additional compensation will be made by the State for any delays, inconvenience, or damage sustained by them due to interference from the utility appurtenances or the operation of moving them. The locations of the underground utilities shown on the Plans have been obtained by diligent field checks and searches of available records. It is believed that they are essentially correct, but the Division makes no guarantees as to their exact locations.

It is the Contractor's responsibility to determine the exact location of each utility in project areas where these utilities would be interrupted or damaged by performing work. In the event of damage or disruption to utilities which are active and are to remain in service, the Contractor shall immediately notify the responsible official of the organization operating the utility that is interrupted.

The Contractor shall assume all costs, charges or claims connected with the interruption and repair of any utility damaged by the Contractor.

105.7-COOPERATION BETWEEN CONTRACTORS:

The Division reserves the right at any time to contract for and perform other or additional work on or near the work covered by the Contract.

When separate Contracts are let within the limits of any one project, each Contractor shall conduct their work so as not to interfere with or hinder the progress or completion of the work being performed by other Contractors. Contractors working on the same project shall cooperate with each other as directed.

Each Contractor involved shall assume all liability, financial or otherwise, in connection with their Contract and shall protect and save harmless the Division from any and all damages or claims that may arise because of inconvenience, delay, or loss experienced by them because of the presence and operations of other Contractors working within the limits of the same project.

The Contractor shall arrange their work and shall place and dispose of the materials being used so as not to interfere with the operations of the other Contractors within the limits of the same project. The Contractor shall join work with that of the others in an acceptable manner and shall perform it in proper sequence to that of the others.

In the event the Engineer finds further coordination effort is necessary, the Engineer shall call a meeting of the Contractors involved. After the meeting has been held, the Engineer may notify the Contractors of the action required of each and the Engineer's decision shall be final.

105.8-CONSTRUCTION STAKES, LINES AND GRADES:

Except when "Construction Layout Stakes", is included in the Contract, the Engineer will set construction stakes establishing lines, slopes and continuous profile-grade, together with necessary reference stakes and bench marks. The Engineer will set sufficient right-of-way stakes to define the right-of-way limits. The Engineer will set stakes to mark centerline and establish bench marks for bridges and special structures as may be considered necessary.

The stakes and marks in the paragraph above shall constitute field control by and in accordance with which the Contractor shall establish all additional stakes and marks necessary to secure a correct layout of all the work. All stakes, except those set by the Engineer, shall be furnished by the Contractor.

The Contractor shall not engage the services of any person or person in the employ of the Division for the performance of any of the Contractor's layout work.

The Contractor shall be responsible for having the finished work in reasonably close conformity with the lines, grades, elevations, and dimensions called for on the Plans or established by the Engineer. The Contractor shall be held responsible for the preservation of stakes, marks, and references, and shall have them reset at the Contractor's expense when they are damaged, lost, displaced, or removed.

105.9-AUTHORITY AND DUTIES OF THE PROJECT ENGINEER OR PROJECT SUPERVISOR:

The project Engineer or Supervisor has immediate charge of the engineering details of each construction project. The Engineer or Supervisor are responsible for the administration and satisfactory completion of the project.

The Project Engineer or Supervisor has the authority to reject defective material and to suspend any work that is being improperly performed.

The Project Engineer or Supervisor will have the authority to suspend the work wholly or in part due to the failure of the Contractor to correct conditions unsafe for the employees or the general public; for failure to carry out provisions of the Contract; for failure to carry out orders; for such periods as they may deem necessary due to unsuitable weather. All such suspension orders will be directed to the Contractor in writing. The suspension of the work for the above reasons does no relieve the Contractor of their responsibility according to [107.16](#).

105.10-AUTHORITY AND DUTIES OF THE INSPECTOR:

Inspectors employed by the Division will be authorized to inspect all work done and materials furnished. Such inspection may extend to all or any part of the work and to the preparation, fabrication or manufacture of the materials to be used. The Inspector is not authorized to alter or waive the provisions of the Contract. The Inspector is authorized to call the attention of the Contractor to any failure of the work or materials to conform to the Specifications and Contract. The Inspector is authorized to reject materials which do not meet specification requirements or suspend the portion of the work involved until any question at issue can be referred to the Project Engineer or Project Supervisor. The Inspector is not authorized to issue instructions contrary to the Plans and Specifications. The Inspector shall not act as foreman or perform other duties for the Contractor, nor interfere with the management of the work by the latter.

105.11

105.11-INSPECTION OF WORK AND MATERIALS:

All materials and each part or detail of the work shall be subject to inspection by the Engineer. The Engineer or an representative shall be allowed access to all parts of the work and shall be furnished with such information and assistance by the Contractor as is required to make a complete and detailed inspection.

At the Engineer's request, the Contractor, at any time before acceptance of the work, shall remove or uncover such portions of the finished work as may be directed. After examination, the Contractor shall restore said portions of the work to the standard required by the Specifications. Should the work thus exposed or examined prove acceptable, the uncovering, or removing, and the replacing of the covering or making good of the parts removed will be paid for as extra work; but should the work so exposed or examined prove unacceptable, the uncovering, or removing, and the replacing of the covering or making good of the parts removed shall be at the Contractor's expense.

Any work done or materials used without supervision or inspection by an authorized Division representative may be ordered removed and replaced at the Contractor's expense. Failure to reject any defective material or work shall not in any way prevent later rejection when such defects are discovered, nor obligate the Division to final acceptance.

When any unit of government or political subdivision or any railroad corporation is to pay a portion of the cost of the work covered by this Contract, its respective representatives shall have the right to inspect the work. Such inspection shall in no sense make any unit of government or political subdivision or any railroad corporation a party to this Contract, and shall in no way interfere with the rights of either party hereunder.

105.12-REMOVAL OF UNACCEPTABLE AND UNAUTHORIZED WORK:

Except as provided in [105.3](#), all work which does not conform to the requirements of the Contract will be considered as unacceptable work.

Unaccepted work, whether the result of poor workmanship, use of defective materials, damage through carelessness or any other cause, found to exist prior to the final acceptance of the work, shall be removed immediately and replaced in an acceptable manner.

Unacceptable material shall be removed from the job site.

No work shall be done without lines and grades having been given or approved by the Engineer. Work done contrary to the instructions of the Engineer, work done beyond the lines shown on the Plans, or as given, except as specified, or any extra work done without authority, will be considered as unauthorized and will not be paid for under the provisions of the Contract. Work so done may be ordered removed or replaced at the Contractor's expense.

Upon failure on the part of the Contractor to comply promptly with any order of the Engineer, made under the provisions of this Subsection, the Engineer will have authority to cause unacceptable work to be remedied or removed and replaced and unauthorized work to be removed, and to deduct the

costs from any monies due or to become due the Contractor.

105.13-LOAD RESTRICTIONS:

The Contractor shall comply with all legal load restrictions in the hauling of materials on public roads. A special permit will not relieve the Contractor of liability for damage which may result from the moving of equipment.

The operation of equipment of such weight or so loaded as to cause damage to structures or the roadway or to any other type of construction will not be permitted. Hauling of materials over the base course or surface course under construction shall be limited as directed. No loads will be permitted on a concrete pavement, base or structure before the expiration of the curing period.

In no case shall legal load limits be exceeded unless permitted in writing. The Contractor shall be responsible for all damage done by their own equipment.

105.14-MAINTENANCE DURING CONSTRUCTION:

The Contractor shall maintain the work during construction and until the project is accepted except as otherwise provided in 105.16.1. This maintenance shall constitute continuous and effective work prosecuted day by day, with adequate equipment and forces to the end that the roadway and structures are kept in satisfactory condition at all times.

In the case of a Contract for the placing of a course upon a course or subgrade previously constructed, the Contractor shall maintain the previous course or subgrade during all construction operations.

All cost of maintenance work during construction and before the project is accepted shall be included in the unit prices bid on the various pay items, and the Contractor will not be paid an additional amount for such work except as otherwise provided in 104.5.

105.15-FAILURE TO MAINTAIN ROADWAY OR STRUCTURE:

If the Contractor, at any time, fails to comply with the provisions of 105.14, the Engineer will immediately notify the Contractor of such non-compliance.

If the Contractor fails to remedy unsatisfactory maintenance within 24 hours after receipt of such notice, the Engineer may immediately proceed to maintain the project, and the entire cost of maintenance will be deducted from monies due or to become due the Contractor on their Contract.

105.16-ACCEPTANCE:

105.16.1-Partial Acceptance: If at any time during the prosecution of the project, the Contractor completes a unit or portion of the project, such as a structure, an interchange, or a section of road or pavement, the Contractor may request the Engineer to make final inspection of that unit. If the Engineer finds upon inspection that the unit has been completed in compliance with the Contract, the Engineer may accept that unit as being completed and the Contractor may be relieved of further responsibility for that unit. Such partial acceptance shall in no way void or alter any of the terms of the Contract.

105.16.2

105.16.2-Final Acceptance: Upon due notice from the Contractor of presumptive completion of the entire project, the Engineer will make an inspection. If all construction and other contractual requirements provided for and contemplated by the Contract is found completed to satisfaction, that inspection will constitute the final inspection. The Engineer will make the final acceptance and notify the Contractor in writing of this acceptance. Final acceptance will be the date the Contract Completion Report is fully executed by the Division.

If, however, the inspection discloses any work, in whole in part, as being unsatisfactory, the Engineer will give the Contractor the necessary instruction for correction of same in writing, and the Contractor shall immediately comply with and execute such instructions. Upon correction of the work, another inspection will be made which will constitute the final inspection provided the work has been satisfactorily completed. In such event, the Engineer will make the final acceptance and notify the Contractor in writing of this acceptance. Final acceptance will be the date the Contract Completion Report is fully executed by the Division.

105.17-CLAIMS FOR ADJUSTMENT AND DISPUTES:

If additional compensation is considered due for work or material not covered in the Contract, written notification of the intent to make a claim under Subsection 104.9, shall be given to the Engineer before beginning or continuing the affected work.

The Engineer will respond as described under Subsection 104.9 following notification. The Contractor shall provide necessary cooperation and information to the Engineer during the period of notification, review, and evaluation to provide possible resolution of the Contract question and avoid, if possible, further claim process actions.

If notification is not given, or the Contractor does not afford the Engineer proper facilities for keeping strict account of actual costs, the Contractor waives any claim for additional compensation. Notice by the Contractor, and the fact that the Engineer has kept account of the costs shall not be construed as substantiating the validity of the claim. An equitable adjustment will be made to the Contract if the claim is found to have merit.

- A. Claim submittals shall be in sufficient detail to enable the Engineer to determine the basis for entitlement and the resulting costs. The following information if available, should accompany each claim submitted:
 - 1. Detailed factual statement of the claim providing all necessary dates locations, and items of work affected by the claim.
 - 2. The date actions resulting in the claim occurred or conditions resulting in the claim became evident.

3. A copy of the "Notice of Potential Claim" Form (available from the Division), filed by the Contractor for the specific claim.
 4. The name, title, and activity of each Department employee knowledgeable.
 5. The name, title, and activity of each Contractor employee knowledgeable about the facts that gave rise to such claim.
 6. The specific provisions of the Contract that support the claim, and a statement why the provisions support the claim.
 7. The identification of any pertinent documents, and the substance of any material communications relating to the claim.
 8. A statement whether the additional compensation or extension of time is based on the provisions of the Contract or an alleged breach of Contract.
 9. If an extension of time is also sought, the specific days for which it is sought and the basis for such claim as determined by an analysis of the construction schedule.
 10. The amount of additional compensation sought and a breakdown of that amount.
- B. Required Certification of Claims. The claim submittal shall include the Contractor's written certification, under oath, attesting to the following:
1. The claim is made in good faith.
 2. Supportive data is accurate and compete to the Contractor's best knowledge and belief.
 3. The amount of the claim accurately reflects the Contractor's actual cost incurred.

In complying with this requirement, the Contractor shall use the following certification:

105.17

Under penalty of law for perjury or falsification, the undersigned _____ (Company), hereby certifies that the claim for extra compensation and time, if any, made herein for work on this Contract is a true statement of the actual costs incurred and time sought, and is fully documented and supported under the Contract between the parties this _____ day of _____, _____.

_____(Company)

By _____

Its

ATTEST:

By _____

Its _____

C. Review of Claims. All claims filed will be subject to review by the Division at any time following the claim filing, whether or not the claim is part of a suit pending in the courts of this State. The review may begin upon submission. The Contractor, Subcontractor(s), or Supplier(s) shall cooperate with the Division and shall, at a minimum, provide access to the following documents of the Contractor, Subcontractor(s), its/their subsidiaries, separate divisions and affiliates if said documents are available:

1. Daily time sheets and foreman's daily reports.
2. Union agreements if any.
3. Insurance, welfare, and benefits records.
4. Payroll register.
5. Earnings records.

6. Payroll tax returns.
7. Material invoices, purchases orders, and all material and supply Acquisition Contracts.
8. Material cost distribution worksheets.
9. Equipment records (list of company equipment, rates, etc.).
10. Vendor rental agreements and subcontractor invoices.
11. Subcontractor payment certificates.
12. Canceled checks (payroll and vendors).
13. Job cost report.
14. Job payroll ledger.
15. General ledger, general journal, (if used) and all subsidiary ledgers and journals together with all supporting documentation pertinent to entries made in these ledgers and journals.
16. Cash disbursements journal.
17. Depreciation records on all company equipment.
18. All other documents used to develop costs for the Contractor's internal purposes in establishing the actual cost of owning and operating equipment.
19. All documents related to the preparation of the Contractor's bid including the final calculations on which the bid was based.
20. Worksheets used to prepare the claim, establishing the cost components for items of the claim including, but not limited to, labor, benefits and insurance, materials, equipment, subcontractors, and all documents that establish the time periods, individuals involved, the hours and the rates for the individuals.

SECTION 106

CONTROL OF MATERIALS

106.1-SOURCE OF SUPPLY AND QUALITY REQUIREMENTS:

The material used on the work shall meet all quality requirements of the Contract. To expedite the inspection and testing of materials, the Contractor shall notify the Engineer of their proposed sources of materials as required in 103.10. At the option of the Engineer, materials may be approved at the source of supply before delivery is started. If it is found after trial that sources of supply for previously approved materials do not produce specified products, the Contractor shall furnish materials from other sources at no increase in cost to the Division.

Quality Control by the Contractor: The Contractor shall provide and maintain a quality control system. This quality control system shall conform to all requirements of the Specifications.

106.1.1-Domestic Aluminum, Glass, Steel and Iron in Public Works Project:

106.1.1.1-Definitions: Unless the context in which used clearly requires a different meaning, as used in this section:

"Public Works" includes roads, highways, streets, bridges, sidewalks, sewage systems, buildings, engineering and architectural works, and any other structure, facility or improvement constructed or undertaken by the Division.

"Aluminum, glass, steel and iron products" means products rolled, formed, shaped, drawn, extruded, forged, cast, fabricated, or otherwise similarly processed from aluminum, glass, steel, and iron. "Domestic aluminum, glass, steel and iron products" means aluminum, glass, steel and iron products made in the United States.

Buy American requirements applies to coating. Coating is considered a manufacturing process and is interpreted to mean all processes that protect or enhance the value of a material or product to which it is applied such as epoxy coatings, galvanizing or painting.

106.1.1.2-Preference For Domestic Aluminum, Glass, Steel and Iron Products: The Division shall require that all aluminum, glass, steel or iron products to be supplied for this project shall be domestic aluminum, glass, steel or iron products in compliance with Chapter 5, Article 19 of the West Virginia Code, unless the offered or bid price of the domestic aluminum, glass, steel or iron products is unreasonable or that the domestic aluminum, glass, steel or iron products are not produced in sufficient quantities to meet the project requirements. The offered or bid price of domestic aluminum, glass, steel or iron products is not unreasonable unless it is more than 20 percent higher than the offered bid price of foreign made aluminum, glass, steel or iron products (including any applicable duty) or that if the aluminum, glass, steel, or iron

products to be supplied are produced in a "substantial labor surplus area" as determined by the United States Department of Labor, the offered or bid price of domestic aluminum, glass, steel or iron products is not unreasonable unless it is more than 30% higher than the offered or bid price of foreign-made aluminum, glass, steel or iron products (including any applicable duty). A listing of the "substantial labor surplus areas" can be obtained from the Division's Contract Section. This Section does not apply to any project in an amount less than \$50,000.00.

106.1.1.3-Contract Payments; Recovery in Case of Violation of Section:

The Division may not authorize or make any payments to a Contractor under a contract which contains or should contain the provision required by Section 106.1.1.2 unless such Contractor has fully complied with such Section. Prior to such payment, the Division will require the Contractor to furnish a certificate of compliance from each subcontractor and supplier. Payments made by the Division to any who did not comply with this section may be recovered by the Division.

106.1.1.4-Procedures For Use of Foreign-Made Materials: If foreign-made aluminum, glass, steel or iron products are supplied in compliance with this Section, the Contractor shall be responsible for providing procedures acceptable to the Division for determining that specification requirements are met, including all inspections at no additional cost to the Division. The use of foreign-made products will not be reason for granting an extension of time.

106.1.1.5-Use of Domestic and Foreign Steel: When steel or iron is used it shall be in compliance with Section 165 of the Surface Transportation Assistance Act of 1982, and the applicable provisions of Title 23CFR, Section 635.410, as amended, entitled "Buy American Requirements".

Pig Iron and processed, pelletized, and reduced iron ore manufactured outside of the United States may be used in the domestic manufacturing process for steel and/or iron materials used in Federal-aid highway construction projects.

When the Contractor desires to utilize foreign steel or iron for any of the applicable items contained in this project the Contractor shall comply with the provisions, in addition to all other provisions contained in the contract.

To be considered domestic in character, all manufacturing processes must occur in the United States of America. Coating is a manufacturing process.

The Contractor, if he desires to utilize foreign steel or iron, shall submit their bid for furnishing domestic steel iron on the normally prescribed bidding forms. In addition, the Contractor shall submit an alternate bid for furnishing foreign steel or iron on the "Form for Use of Foreign Materials" contained in Section F (1) of the Notice.

These provisions do not prevent the minimal use of foreign steel or iron provided the cost of materials (less installation) does not exceed one tenth of one percent (0.1 percent) of the total contract cost or \$2,500, whichever is

106.2

greater.

In addition to the requirements of 103.2-Award of Contract, the award of the contract, if awarded, will be made to the bidder who submits the lowest total bid for the contract based on furnishing domestic steel or iron unless such bid exceeds the lowest total bid received for the contract based on furnishing foreign steel or iron by more than 25 percent, and further provided that the requirements of 106.1-Source of Supply and Quality Requirements, have been applied. The more stringent condition, either this section or of 106.1.1.2-Preference For Domestic Aluminum, Glass, Steel and Iron Products shall apply.

106.2-LOCAL MATERIAL SOURCES:

106.2.1-Designated Sources: Possible sources of local materials may be designated in the contract documents. The quality of material in such deposits will be acceptable in general, but the Contractor shall determine for themselves the amount of equipment and work required to produce a material meeting the Specifications. It shall be understood that it is not feasible to ascertain from samples the limits for an entire deposit, and that variations shall be considered as usual and are to be expected. The Engineer may order procurement of material from any portion of a deposit and may reject portions of the deposit as unacceptable.

The Division may acquire and make available to the Contractor the right to take materials from the sources designated in the contract documents together with the right to use such property as may be specified, for plant site, stockpiles, and haul roads.

106.2.2-Contractor Furnished Sources: If the Contractor desires to use materials from sources other than those designated, the Contractor shall acquire the necessary rights to take materials from the sources and shall pay all costs related thereto, including any which may result from an increase in length of haul. All costs of exploring and developing such other sources shall be borne by the Contractor. The use of material from other than designated sources will not be permitted until representative samples taken by the Engineer have been approved and written authority is issued for the use thereof.

When material deposits are not designated in the Contract, the Contractor shall provide sources of material acceptable to the Engineer.

When sources of material or material deposits are provided by the Division will assume the cost of processing samples to determine the suitability of the material unless otherwise specified.

Sites from which material has been removed shall, upon completion of the work, be left in a neat and presentable condition and shall be properly drained.

Unless otherwise directed by the Engineer, they shall be seeded and mulched as provided in 652 without additional compensation. Where practicable, borrow pits, gravel pits, and quarry sites shall be located so they will not be visible from the highway.

In accordance with the agreement between the Division of Highways and the

Division of Environmental Protection, the Contractor cannot furnish material from borrow areas outside the right of way for any other public or private use.

106.3-SAMPLES, TESTS, CITED SPECIFICATIONS:

All materials will be inspected, tested and approved prior to incorporation into the work. Any work which incorporates materials prior to the above evaluation shall be performed at the Contractor's risk, and may subsequently be considered as unacceptable. Unless otherwise specified, the materials shall meet the applicable Standard or Interim Specifications of the American Association of State Highway and Transportation Officials, the Standard or Tentative Specifications of the American Society for Testing and Materials, or Standards adopted by other specifying agencies, with preference given in the same order in which the above agencies are listed. The specification which is current at the time of advertisement for bids shall govern, except that, with the approval of the Engineer, subsequent revisions or adoptions may govern. All materials being used are subject to inspection, testing or rejection at any time prior to final acceptance of the completed work.

The Contractor shall be responsible for the quality of construction and materials incorporated. When called for in the Specifications, the Contractor shall perform all necessary process control inspection, sampling and testing.

All materials will be approved for acceptance through the Division's acceptance procedures. The Division has the exclusive right and responsibility for determining the acceptability of the construction and materials incorporated.

The Division may use the results of the Contractor's inspection, sampling and testing for acceptance purposes.

Lot or subplot sizes will normally be designated. In the event that operational conditions cause work to be interrupted, or only partially completed before the lot size designated has been achieved, the lot or subplot may be redefined by the Engineer as being either the amount of work accomplished within the day or that work partially completed combined with the next lot or subplot of work. It is the intent of these Specifications that the number of samples required to evaluate each lot or subplot will be unchanged even when the lot or subplot is redefined.

When an acceptance plan is cited, it shall be in accordance with [106.3.1](#).

106.3.1-Acceptance Plans:

106.3.1.1-Percent Within Tolerance: The percentage of each lot or subplot of material, product, item of construction, or completed construction within the specified tolerances will be determined by the procedures as referenced by the specification requirements. When West Virginia AP-A is referenced, it will consist of Tables 106-1 to 106-5 inclusive, published in MP 106.00.20.

106.3.1.2-Sampling of Reworked Lots or Sublots: It is the intent of these Specifications that lots or sublots of materials, products, items of construction or completed construction meet specification requirements at the time of

106.4

submission. Lots or sublots generally will not be resampled unless reworked before submission. Sampling after reworking will be at the expense of the Contractor.

106.4-PLANT INSPECTION:

The Engineer may undertake the inspection of materials at the source.

In the event plant inspection is undertaken, the following conditions shall be met:

- i. The Engineer shall have the cooperation and assistance of the Contractor and the producer with whom the Contractor has contracted for materials.
- ii. The Engineer shall have full entry at all times to such parts of the plant as may concern the manufacture or production of the materials being furnished.
- iii. Adequate safety measures are to be provided and maintained.

The Division reserves the right to retest all materials, which have been tested and accepted at the source of supply, after the materials have been delivered to the project and prior to incorporation into the work and to reject all materials which, when retested, do not meet the requirements of these Specifications or those established for the specific project.

106.5-STORAGE OF MATERIALS:

Materials shall be so stored as to assure the preservation of their quality and fitness for the work. Stored materials, even though approved before storage, may again be inspected prior to their use in the work. Stored materials shall be located so as to facilitate their prompt inspection. Approved portions of the right-of-way may be used for storage purposes and for the placing of the Contractor's plant and equipment, but any additional space required therefore must be provided by them at their expense. Private property shall not be used for storage purposes without written permission of the owner or lessee, and if requested by the Engineer, copies of such written permission shall be furnished. All storage sites shall be restored to their original condition by the Contractor at their expense. This shall not apply to the stripping and storing of topsoil, or to other materials salvaged from the work.

Care shall be exercised to protect finished concrete surfaces from being stained from storing or placing materials, including but not limited to reinforcing bars or mesh or unpainted structural steel, on same. Any such material so stored shall be adequately protected from weather. Any stains resulting from storage of materials on finished concrete surfaces shall be removed by the Contractor at their expense.

Aggregate stockpiles may be made on ground that is denuded of vegetation, hard, and well drained. If necessary, the ground shall be covered with two inch (50 mm) plank. Different kinds and sizes of aggregates shall be kept separate during transportation, handling, and storage until batched. If necessary,

partitions of suitable height and strength shall be constructed between stockpiles to prevent different materials from becoming mixed. Care must be taken to prevent segregation of the coarse and fine particles of aggregates from taking place during handling or hauling. The inclusion of foreign materials will not be permitted. Aggregates placed directly on the ground shall not be removed from the stockpiles within one foot (300 mm) of the ground until the final cleaning up of the work, and then only the clean aggregate will be permitted to be used.

106.6-HANDLING MATERIALS:

All materials shall be handled in such manner as to preserve their quality and fitness for the work. Aggregates shall be transported from the storage site to the work in tight vehicles, so constructed as to prevent loss or segregation of materials after loading and measuring, in order that there may be no inconsistencies in the quantities of materials intended for incorporation in the work as loaded and the quantities as actually received at the place of operations.

106.7-UNACCEPTABLE MATERIALS:

106.7.1-Acceptance or Rejection: Following the application of the appropriate acceptance plan, the decision of the Engineer will be final as to the acceptance, rejection, or acceptance at an adjusted price of sampled lots or sublots.

106.7.2-Disposition of Lots or Sublots: Lots or sublots not conforming to specification requirements may be reworked or removed and replaced and resubmitted for acceptance. All nonconforming lots or sublots evaluated as unsatisfactory for the use intended shall be reworked or removed and replaced and resubmitted for acceptance. When the evaluation indicates the lots or sublots may satisfactorily remain in place, acceptance will be an adjusted price as stated in the Specifications or as directed by the Engineer.

106.8-DIVISION-FURNISHED MATERIAL:

The Contractor shall furnish all materials required to complete the work, except those specified to be furnished by the Division.

Materials furnished by the Division will be delivered or made available to the Contractor at the points specified in the Contract.

The cost of handling and placing all materials after they are furnished to the Contractor shall be considered as included in the contract price for the item in connection with which they are used.

The Contractor will be held responsible for all material delivered to them, and deductions will be made from any monies due the Contractor to make good any shortages and deficiencies, from any cause whatsoever, and for any damage which may occur after such delivery, and for any demurrage charges.

106.9-SILENCE OF SPECIFICATIONS:

The apparent silence of these Specifications, Supplemental Specifications, plans and Special Provisions as to any detail, or the apparent omission from them of a detailed description concerning any point shall be regarded as meaning that only material and workmanship of acceptable quality are to be used.

SECTION 107

LEGAL RELATIONS AND RESPONSIBILITY TO PUBLIC

107.1-LAWS TO BE OBSERVED:

The Contractor shall keep fully informed of all Federal and State laws, all local laws, ordinances, and regulations and all orders and decrees of bodies or tribunals having any jurisdiction or authority, which in any manner affect those engaged or employed on the work, or which in any way affect the conduct of the work. The Contractor shall at all times observe and comply with all such laws, ordinances, regulations, orders and decrees; and shall protect and indemnify the State and its representatives against any claim or liability arising from or based on the violation of any such laws, ordinances, regulations, orders, or decrees, whether by themselves, their subcontractors or their employees.

107.2-PERMITS, LICENSES AND TAXES:

The Contractor shall procure all permits and licenses, pay all charges, fees, and taxes, and give all notices necessary and incidental to the due and lawful prosecution of the work.

107.3-PATENTED DEVICES, MATERIALS, AND PROCESSES:

If the Contractor employs any design, devise, material, or process covered by letters of patent or copyright, the Contractor shall provide for such use by suitable legal agreement with the patentee or owner. The Contractor and the surety shall indemnify and save harmless the Division, and affected third party, or political subdivision from and claims for infringement by reasons of the use of any such patented design, device, material or process, or any trademark or copyright, and shall indemnify the Division for any costs, expenses, and damages which it may be obligated to pay by reason of any infringement, at any time during the prosecution or after the completion of the work.

107.4-RESTORATION OF SURFACES OPENED BY PERMIT:

The right to construct or reconstruct any utility service in the highway or street or to grant permits for same, at any time, is expressly reserved by the Division for the proper authorities of the municipality in which the work is done, and the Contractor shall not be entitled to any damages either for the digging up of the street or for any delay occasioned.

Any individual, firm, or corporation wishing to make an opening in the highway must secure a permit from the Division. The Contractor shall allow parties bearing such permits, and only those parties, to make openings in the highway. The Contractor shall, when ordered by the Engineer, make in an acceptable manner all necessary repairs due to such openings and such necessary work will be paid for as "Extra Work", or as provided in these Specifications, and will be subject to the same conditions as original work performed.

107.5-FEDERAL-AID PROVISIONS:

When the United States Government pays any portion of the cost of a project, the Federal Laws and the Rules and Regulations made pursuant to such laws must be observed by the Contractor, and the work shall be subject to the inspection of the appropriate Federal Agency.

Such inspection shall in no sense make the Federal Government a party to the Contract and will in no way interfere with the rights of either party hereunder.

107.6-SANITARY PROVISIONS:

The Contractor shall provide and maintain in a neat, sanitary condition such accommodations for the use of their employees as may be necessary to comply with the requirements of the State and local Boards of Health, or of other bodies or tribunals having jurisdiction. The Contractor shall not create, commit, or maintain a public nuisance.

107.7-PUBLIC CONVENIENCE AND SAFETY:

The Contractor shall at all times so conduct their work as to assure the least possible obstruction to traffic. The safety and convenience of the general public and the residents along the highway and the protection of persons and property shall be provided for by the Contractor as specified under [104.5](#).

The Contractor shall comply with all applicable Federal, State, and local laws governing safety, health and sanitation. The Contractor shall provide all safeguards, safety devices and protective equipment and take any other needed actions, on their own responsibility, or as the Engineer may determine, reasonable necessary to protect the life and health of employees on the job and the safety of the public and to protect property in connection with the performance of the work covered by the Contract.

The Contractor and any subcontractor shall not require any laborer or mechanic employed in performance of the Contract to work in surroundings or under working conditions which are unsanitary, hazardous, or dangerous to their health or safety, as determined under construction safety and health standards (Title 29, Code of Federal Regulations, Part 1926, formerly Part 1518, as revised from time to time), promulgated by the United States Secretary of Labor, in accordance with Section 107 of the Contract Work Hours and Safety Standards Act (83 Stat. 96).

107.7.1

107.7.1 – Safety Plan:

The Contractor shall comply with this subsection if the Total Contract Bid Amount exceeds \$2,000,000 or is otherwise noted on the plans. The contractor will provide a copy of the company comprehensive safety and health program and the name of the company safety officer at the preconstruction conference or prior to start of work. A copy of the comprehensive safety and health program for each subcontractor and the name of the company safety officer must be submitted with the request for subcontract approval. The company comprehensive safety and health program should be in accordance with ANSI A10.38-1991, “Basic Elements of an Employer Program to Provide a Safe and Healthful Work Environment” or equivalent.

A site specific safety plan covering the work of the prime contractor and all known subcontractors must be prepared and submitted at the preconstruction conference or prior to the start of work. The site specific plan must include the name of the competent person(s) responsible for safety at the project site. As additional subcontracts are negotiated the site specific safety plan for that work can be submitted with the subcontract request.

Contractor employees shall be provided hazard recognition and avoidance training. Further, newly employed workers shall be provided safety orientation training prior to being assigned any task. This training can be provided by the contractor or the contractor’s representative. Likewise, training provided by other sources based on an employee’s initiative or his or her affiliation with the other groups is permissible. All training should be current and up to date with appropriate refresher courses provided if previous training was not within the last three years.

All contractor safety training shall be administered or monitored by the contractor’s qualified representative, known as the company safety officer. “Qualified” means one who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training and experience, has successfully demonstrated his or her ability to solve or resolve problems relating to the subject matter, the work or the project. Acceptable training for this individual to be considered qualified includes, but is not limited to, completion of the 30-hour OSHA 500 Trainer Course in Occupational Safety and Health Standards for the Construction Industry or its equivalent.

The Contractor or Subcontractor working on the project will conduct weekly safety “tool box” talks to discuss relevant safety issues and this meeting will be open to attendance and active participation by the on-site Division of Highways Staff.

107.8 - RAILWAY-HIGHWAY PROVISIONS:

The Contractor shall comply with the following provisions when performing any operations adjacent to or within the existing right of way of the Railroad. References to the Railroad’s Chief Engineer can also mean an authorized representative.

107.8.1 - NOTICE OF STARTING WORK: The Contractor shall not

start any work on Railroad right of way until he has complied with the following conditions:

- (a) Give the Railroad's Chief Engineer written notice at least ten days in advance of the date he proposes to begin work on or adjacent to the Railroad right of way.
- (b) Obtain written approval from the Railroad of the Railroad Protective Insurance coverage as required herein.
- (c) Obtain written authorization from the Railroad to begin work on Railroad right of way. This authorization can be expected within two weeks after insurance has been approved.

107.8.2 - INSURANCE: The Contractor shall secure and provide, until all work under the terms of the project is satisfactorily completed and accepted, the following types of insurance in the amounts and form as hereinafter set forth:

- (a) Contractor's Public Liability Insurance and Protective Public Liability Insurance: With respect to the operations performed by the Contractor or the subcontractors, the Contractor must carry in his own behalf this insurance providing a limit of not less than \$2,000,000 bodily injury and/or property damage combined, for damages arising out of bodily injuries to or death of all persons in any one occurrence and for damage to or destruction of property, including the loss of use thereof, in any one occurrence. This limit may be single limit of primary coverage or a combination of primary and excess coverage which will meet the \$2,000,000 requirement. Said insurance policy shall include coverage for explosion, collapse and underground hazard ("XCU" coverage). A certificate of insurance shall be provided to the Railroad before work begins and said certificate shall provide Railroad thirty (30) days advance written notice of cancellation or material change in insurance coverage. If any part of the work is sublet, public liability insurance and evidence thereof in the same amounts as required of the Prime Contractor, shall be provided by or in behalf of the subcontractor to cover his operations on railroad right of way.
- (b) Railroad Protective Liability Insurance: With respect to the operations performed, the Contractor or any subcontractors, the Contractor must provide in the name of Railroad, a policy providing a limit of \$2,000,000 per occurrence bodily injury or death and property damage combined. Said insurance shall be furnished with an aggregate of \$6,000,000 applying separately to each annual period. This policy shall be written on the ISORIMA Form of Railroad Protective Insurance (ISO Form CG00350690) with Pollution Exclusion Amendment ISO Form CG 28311185 or their

107.8.3

equivalents). The policy of insurance specified in this section shall be countersigned by a resident agent of the State of West Virginia in accordance with Section 103.6.5. The original of the policy shall be submitted to and be approved by the Railroad before work is commenced on its right of way.

107.8.3 - USE OF GRADE CROSSINGS: If the Contractor desires a temporary grade crossing of the Railroad's tracks other than that shown in the project plans; to use an existing private grade crossing; or to use an existing public grade crossing with unlicensed construction equipment, the Contractor shall make arrangements in writing with the Railroad and will be required to bear all costs, including flagging, incidental to such crossings.

107.8.4 - INTERFERENCE WITH RAILROAD OPERATIONS:

All work to be performed by the Contractor shall be performed in a manner agreeable to the Railroad's Chief Engineer. The Contractor shall use reasonable care and diligence and cooperate with officials of the Railroad in order to avoid accidents, damages or unnecessary delay to, or interference with train movement of the Railroad.

When work within Railroad right of way is of a nature that it impedes Railroad operations such as, but not limited to, use of runaround tracks or the necessity for reduced speed, the Contractor shall schedule and conduct his operations so that such impediment is reduced to the absolute minimum.

Any cost incurred by the Railroad for repairing damages to its property or to property of its tenants, caused by or resulting from the operations of the Contractor, shall be paid directly to the Railroad by the Contractor.

The Contractor shall assume all liability for any and all damages to his work, employees, subcontractor, equipment and materials caused by Railroad traffic.

No charge or claim of the Contractor against either the Division or the Railroad will be allowed for hinderance or delay on account of train traffic, work done by Railroad, delay incident to or necessary for safe operation and maintenance of the railroad or any delays due to compliance with these special provisions.

107.8.5 - CONSTRUCTION PROCEDURES: It shall be the Contractor's responsibility to arrange a schedule with the Railroad for accomplishing his work and the Railroad's or its tenants work. The Contractor in arranging a schedule shall ascertain, from the Railroad, the lead time required for assembling crews and materials and shall make due allowance therefor.

The Contractor shall submit to the Railroad's Chief Engineer, with a copy to the Division of Highways, work schedule and information regarding methods and procedures for performing work, e.g., plans and specifications for shoring and sheeting, and for protective shields covering all Railroad facilities. The Contractor shall obtain Railroad approval before commencing said work.

The Contractor shall take special precaution and care when excavating for shoring pits and footers adjacent to tracks and in driving piles to always provide adequate lateral support for the tracks and the loads which they carry, so as not to disturb the track alignment and surface and to avoid obstructing track clearances with working equipment, tools or materials.

A copy of the Contractor's blasting sequence will be provided to the railroad for their information prior to any blasting. The Contractor shall obtain specific approval of the Railroad's Chief Engineer for use of explosives on Railroad property.

All construction equipment that is parked near the track shall be effectively immobilized so that it cannot be moved by unauthorized persons.

Materials and equipment shall not be stored where they will interfere with Railroad operations, nor on the right of way of the Railroad without first having obtained written permission from the Railroad's Chief Engineer.

The Contractor will be required to maintain all ditches and drainage structures and keep them free of silt or other obstructions, to promptly repair eroded areas within Railroad right of way and to repair any other damage to the property of the Railroad or its tenants which may be the results of their operations.

Upon completion of the work, the Contractor shall remove from within the limits of the Railroad's right of way, all machinery, equipment, surplus materials, falsework, rubbish or temporary buildings which belong to the Contractor and leave said right of way in a condition satisfactory to the Railroad's Chief Engineer.

107.8.6 - TRACK CLEARANCES: The minimum track clearances to be adhered to by the Contractor during construction will be 15 feet (3 m) from centerline of the track or as approved by the Railroad's Chief Engineer. However, before undertaking any work within Railroad right of way or before placing any obstruction over any track, the Contractor shall:

- (a) Notify the Railroad's Chief Engineer at least 72 hours in advance of work.
- (b) Receive assurance from the Railroad's Chief Engineer that arrangements have been made for any flagging services necessary.
- (c) Receive permission from the Railroad's Chief Engineer to proceed with the work.

107.8.7 - FLAGGING SERVICES: Under the terms of the agreement between the Division and the Railroad, the Railroad has sole authority to determine the need for flagging required to protect its operations.

In general, the services of Railroad flaggers will be requested when the Contractor's operations will be on or over the Railroad's right of way: (a) during the excavation, placing and removal of cofferdams, sheeting, shoring, driving of piling or placing of concrete footers adjacent to the track; (b) driving of pile bents adjacent to the track; (c) construction of the permanent structure including erection and removal of falsework, bracing or forms over or adjacent

107.8.7

to the track; (d) transporting material or equipment across the track; (e) any operations involving direct interference with and/or coming in the close vicinity of power lines or Railroad signal and communication lines, underground cables, fuel oil facilities or pipelines which might result in fire or damage to such facilities to endanger Railroad operations or to endanger the public in the transacting of business on Railroad right of way; (f) fouling of operating clearances or reasonable probability of accidental hazard to Railroad traffic; (g) during removal of portions of existing structures immediately over or adjacent to a track; and (h) at all other times when the Railroad's Chief Engineer has determined conditions require such protection.

Flagging hours shown in the plans shall be reviewed by the Contractor and will be used as the approved flagging hours. If the Contractor feels that the hours shown in the plans are not correct, he shall submit to the Engineer, in writing within 60 days of the award of the project, his estimate for review and approval. The Department shall have 30 days to approve the revised flagging hours. Additional hours may be permitted per Section 104.9.

Additionally, all flagging charges resulting from any work done solely for the benefit of the Contractor will be deducted from the current estimate, due the Contractor.

If the Contractor works within distances that violate instructions given by the Railroad's Chief Engineer or performs work that has not been coordinated with the Railroad's Chief Engineer, a flagman may be required full time at Contractor's expense until the project has been completed.

Any work to be performed by the Contractor which requires flagging service or inspection service (watchman) shall be deferred by the Contractor until the flagging service or inspection service required by the Railroad is available at the job site.

The Contractor shall furnish to the Railroad and the Division of Highways a schedule for all work required to complete the portion of the project within Railroad right of way and arrange for a job site meeting between the Contractor, the Division of Highways, and the Railroad's Chief Engineer. A flagman may not be provided until the job site meeting has been conducted and the Contractor's work schedule provided.

The Contractor will be required to give the Railroad's Chief Engineer at least ten working days of advance written notice of his intent to begin work within Railroad right of way. Once work is begun, and is then suspended at any time for any reason, the Contractor will be required to give the Railroad's Chief Engineer at least three working days advance notice before resuming work on Railroad right of way. Such notice shall include sufficient details of the proposed work to enable the Railroad representative to determine if flagging will be required. Initially, it may take up to 30 days to obtain flagging from the Railroad. When flagging begins, the flagman is usually assigned by the Railroad to work at the project site on a continual basis until no longer needed. A flagman cannot be called for on a spot basis. If flagging becomes unnecessary and is suspended, it may again take up to 30 days to obtain a flagman from the Railroad. Due to Railroad labor agreements, it may be

necessary to give five working days notice before flagging service may be discontinued and responsibility for payment stopped.

The Division of Highways will reimburse the Railroad directly for all costs incurred for flagging services by Railroad personnel, including any temporary grade crossing shown in the project plans up to the amount of hours shown on the Division's Project plans. In the event the Division of Highways is required to reimburse the Railroad for flagging service in excess of the approved flagging hours, such excess cost will be deducted from the monthly and/or final statements of money due the Contractor.

The Railroad flagman assigned to the project will be responsible for notifying the Project Engineer upon arrival at the job site on the first working day that flagging services begin and on the last day that he performs such services. This will be required for each separate period that services are provided. The Project Engineer will document such notification in the project records. When requested, the flagman will also sign the Inspector's daily report form showing daily time spent and activity performed at the project site.

The Contractor and Division of Highways will review and sign the Railroad flagman's time sheet, attesting that the flagman was present during the time recorded. Flagman may be removed by Railroad if form is not signed. If flagman is removed, the Contractor will not be allowed to work on or re-enter the Railroad right of way until the issue is resolved.

107.8.8 - FAILURE TO COMPLY: In the event the Contractor violates or fails to comply with any of the requirements of these provisions:

- (a) The Railroad's Chief Engineer may require that the Contractor vacate Railroad property.
- (b) The Division may stop all work adjacent to the Railroad.

Any such orders shall remain in effect until the Contractor has remedied the situation to the satisfaction of the Railroad's Chief Engineer and the Division of Highways.

All costs incurred resulting from compliance with these provisions shall be incidental to the items in the contract and no separate payment shall be made.

107.9-BRIDGES OVER NAVIGABLE WATERS:

All work on navigable waters shall be so conducted that free navigation of the waterways will not be interfered with and that the existing navigable depths and vertical clearances will not be impaired except as by the U.S. Army Corps of Engineers and/or the U.S. Coast Guard.

107.10-BARRICADES AND WARNING SIGNS:

The Contractor shall provide, erect, and maintain all necessary barricades, suitable and sufficient lights, danger signals, signs, and other traffic control devices, except as provided by [104.5](#), and the Contractor shall take all

107.11

necessary precautions for the protection of the work and safety of the public. Highways closed to traffic shall be protected by effective barricades, and obstructions shall be illuminated during hours of darkness. Suitable warning signs shall be provided to properly control and direct traffic.

The Contractor shall erect warning signs in advance of any place on the project where operations may interfere with the use of the road by traffic and at all intermediate points where the new work crosses or coincides with an existing road. Such warning signs shall be erected in accordance with the Plans furnished.

All barricades, warning signs, lights, temporary signals, and other protective devices must conform with the Standard "Traffic Control for Street and Highway Construction and Maintenance Operations," Published by the West Virginia Division of Highways, and the provisions of [715.9](#).

107.11-USE OF EXPLOSIVES:

When the use of explosives is necessary for the prosecution of the work, the Contractor shall exercise the utmost care not to endanger life or property, including new work. The Contractor shall be responsible for any and all damage resulting from the use of explosives.

All explosives shall be stored in a secure manner, in compliance with all laws and ordinances, and all such storage places shall be clearly marked. Where no local laws or ordinances apply, storage shall be provided satisfactory to the Engineer and in general not closer than 1,000 ft. (305 meters) from the road or from any building or camping area or place of human occupancy.

The Contractor shall notify each public utility company, having structures in proximity to the site of work, of their intention to use explosives and such notice shall be given sufficiently in advance to enable the companies to take such steps as they may deem necessary to protect their property from injury.

107.12-PROTECTION AND RESTORATION OF PROPERTY AND LANDSCAPE:

The Contractor shall be responsible for the preservation of all public and private property and shall protect carefully from disturbance or damage all land monuments and property marks until the Engineer has witnessed or otherwise referenced their location and shall not move them until directed.

The Contractor shall be responsible for all damage or injury to property of any character, during the prosecution of the work, resulting from any act, omission, neglect, or misconduct in the Contractor's manner or method of executing the work, or at any time due to defective work or materials, and this responsibility will not be released until the project shall have been completed and accepted.

When or where and direct or indirect damage or injury is done to public or private property by or on account of any act, omission, neglect, or misconduct in the execution of the work, or in consequence of the nonexecution thereof by the Contractor, the Contractor shall restore, at their own expense, such property to a condition similar or equal to that existing before such damage or injury was

done, by repairing, rebuilding, or otherwise restoring as may be directed, or the Contractor shall make good such damage or injury in as acceptable manner.

107.13-FOREST PROTECTION:

In carrying out work within or adjacent to State or National Forests, the Contractor shall comply with all regulations of the State Fire Marshall, Division of Natural Resources, or any other authority having jurisdiction, governing the protection of forests and the carrying out of work within forests, and shall observe all sanitary laws and regulations with respect to the performance of work in forest areas. The Contractor shall keep the areas in an orderly condition, dispose of all refuse, obtain permits for the construction and maintenance of all construction camps, stores, warehouses, residences, latrines, cesspools, septic tank, and other structures in accordance with the requirements of the Forest Supervisor.

The Contractor shall take all reasonable precaution to prevent and suppress forest fires and shall require their employees and subcontractors, both independently and at the request of forest officials, to do all reasonably within their power to prevent and suppress and to assist in preventing and suppressing forest fires and to make every possible effort to notify a forest official at the earliest possible moment of the location and extent of any fire seen by them.

107.14-RESPONSIBILITY FOR DAMAGE CLAIMS:

The Contractor shall indemnify and save harmless the Division, its officers and employees, from all suits, actions, or claims of any character brought because of any injuries or damage received or sustained by any person, persons, or property on account of the operations of the Contractor; or on account of or in consequence of any neglect in safeguarding the work; or through use of unacceptable materials in constructing the work; or because of any act or omission, neglect, or misconduct of the Contractor; or because of any claims or amounts recovered from any infringements of patent, trademark, or copyright; or from any claims or amounts arising or recovered under the "Worker's Compensation Act," or any other law, ordinance, order, or decree; and so much of the money due the Contractor under and by virtue of their Contract as may be considered necessary by the Division for such purpose may be retained for the use of the Division or, in case no money is due, their surety may be held until such suit or suits, action or actions, claim or claims for injuries or damages as aforesaid shall have been settled and suitable evidence to that effect furnished to the Division; except that money due the Contractor will not be withheld when the Contractor produces satisfactory evidence that the Contractor is adequately protected by public liability and property damage insurance.

107.15-OPENING SECTIONS OF PROJECT TO TRAFFIC:

At the option of the Engineer, certain sections of the work may be opened for traffic. Such opening will not constitute acceptance of the work, or any part thereof, or a waiver of any provisions of the Contract; provided however, that

107.16

on such portions of the project as are accepted for use of traffic, the Contractor shall not be required to assume any expense entailed in maintaining the roadway for traffic. Such expense will be borne by the Division or will be compensated for in the manner provided in 109.4. Any damage to the highway not attributable to traffic which might occur on such section, except slides, shall be repaired by the Contractor at their expense. The removal of slides shall be performed by the Contractor and payment will be in accordance with 104.3. If the Contractor is dilatory in completing shoulders, drainage structures, or other features of the work, the Engineer may order all or a portion of the project open to traffic, but in such event the Contractor shall not be relieved of their liability and responsibility during the period the work is so opened prior to final acceptance. The Contractor shall conduct the remainder of their construction operations so as to cause the least obstruction to traffic.

107.16-CONTRACTOR'S RESPONSIBILITY FOR WORK:

Until final written acceptance of the project by the Engineer, the Contractor shall have the charge and care thereof and shall take every precaution against injury or damage to any part thereof by the action of the elements, or from the nonexecution of the work. The Contractor shall rebuild, repair, restore, and make good all injuries or damages to any portion of the work occasioned by any of the above causes before final acceptance and shall bear the expense thereof except damage to the work due to unforeseeable causes beyond the control of and without the fault of or negligence of the Contractor, including but not restricted to acts of God, of the public enemy or governmental authorities.

In case of suspension of work from any cause whatever, the Contractor shall be responsible for the project and shall take such precautions as may be necessary to prevent damage to the project, provide for normal drainage and to erect any necessary temporary structures, signs, or other facilities at their expense. During such period of suspension of work, the Contractor shall properly and continuously maintain in an acceptable growing condition all living material in newly established plantings, seedings, and soddings furnished under their Contract, and shall take adequate precautions to protect new tree growth and other important vegetative growth against injury.

107.17-CONTRACTOR'S RESPONSIBILITY FOR UTILITY PROPERTY AND SERVICES:

At points where the Contractor's operations are adjacent to properties of railway, telegraph, telephone, and power companies, or are adjacent to other property, damage to which might result in considerable expense, loss, or inconvenience, work shall not be commenced until all arrangements necessary for the protection thereof have been made.

The Contractor shall cooperate with the owners of any underground or overhead utility lines in their removal and rearrangement operations in order that these operations may progress in a reasonable manner, that duplication of rearrangement work may be reduced to a minimum, and that services rendered

by those parties will not be unnecessarily interrupted.

In the event of interruption to water or utility services as a result of accidental breakage, or as a result of being exposed or unsupported, the Contractor shall promptly notify the proper authority and shall cooperate with such authority in the restoration of service. If water service is interrupted, repair work shall be continuous until the service is restored. No work shall be undertaken around fire hydrants until provisions for continued service have been approved by the local fire authority.

107.18-FURNISHING RIGHT-OF-WAY:

The Division will be responsible for securing all necessary right-of-way in advance of construction. Any exceptions will be indicated in the Contract.

107.19-PERSONAL LIABILITY OF PUBLIC OFFICIALS:

In carrying out any of the provisions of these Specifications, or is exercising and power or authority granted to them by or within the scope of the Contract, there shall be no liability upon the Commissioner, Engineer, or their authorized representatives, either personally or as officials of the State, it being understood that in all such matters they act solely as agents and representatives of the Division.

107.20-NO WAIVER OF LEGAL RIGHTS:

The Division shall not be precluded or estopped by any measurement, estimate, or certificate made either before or after the completion and acceptance of the work and payment therefor, from showing the true amount and character of the work performed and materials furnished by the Contractor, nor from showing that any such measurement, estimate or certificate is untrue or is incorrectly made, nor that the work or materials do not in fact conform to the Contract. The Division shall not be precluded or estopped, notwithstanding and such measurement, estimate, or certificate and payment in accordance therewith, from recovering from the Contractor or sureties, or both, such damage as it may sustain by reason of their failure to comply with the terms of the Contract. Neither the acceptance by the Division or any representative of the Division, nor any payment for or acceptance of the whole or any part of the work, nor any extension of time, nor any possession taken by the Division, shall operate as a waiver of any portion of the Contract or of any power reserved or of any right to damages. A waiver of any breach of the Contract shall not be held to be a waiver of any other or subsequent breach.

107.21-PROTECTION OF RIVERS, STREAMS, AND IMPOUNDMENTS:

107.21.1-Erosion and Siltation Control: The Contractor shall exercise every reasonable precaution throughout the life of the Project to prevent silting of rivers, streams, and impoundments such as lakes, reservoirs, etc. Construction of drainage facilities as well as performance of other contract

107.21.2

work which will contribute to the control of siltation shall be carried out in conjunction with earthwork operations or as soon thereafter as is practicable.

The manual entitled "WVDOT Division of Highways Erosion and Sediment Control Manual, latest version is made a part of the Contract. Where any provision of said manual is in conflict with any special erosion and sediment control provision set out and contained in the Proposal and/or in the Plans of a project, the Proposal and/or Plans shall prevail.

Prior to suspension of construction operations for any appreciable length of time, the Contractor shall shape the top of earthwork in such a manner as to permit the runoff of rainwater and shall construct earth berms along the top edges of embankments to intercept runoff water. The berm construction shall not be permitted to decrease the stability of the embankment section. Temporary slope drains shall be provided to carry runoff from embankments which are located in the immediate vicinity of rivers, streams, and impoundments. The slope drains shall be located at approximate 500-ft (150 meter) intervals and shall be stabilized by paving or covering with waterproof materials. Preventive measures taken under this paragraph shall be adequate to control any runoff or erosion products from adjacent cut slopes. Should such preventative measures fail and an appreciable amount of material begins to erode into a river, stream, or impoundment, the Contractor shall act immediately to bring the siltation under control.

The erosion control measures shall be continued until the permanent drainage facilities have been constructed and until the project is accepted.

Unless otherwise approved in writing by the Engineer, construction operations in rivers, streams, and impoundments shall be restricted to those areas where channel changes are shown on the Plans and to those areas which must be entered for the construction of temporary or permanent structures. Rivers, streams, and impoundments shall be promptly cleared of all falsework, piling, debris, or other obstructions placed or caused by the construction operations.

Excavation from the roadway, channel changes, cofferdams, etc., shall not be deposited in or so near to rivers, streams, or impoundments that it will be washed away by high water or runoff.

Frequent fording of live streams with construction equipment will not be permitted; therefore, temporary bridges or other structures shall be used wherever an appreciable number of stream crossings are necessary. Unless otherwise approved in writing by the Engineer, mechanized equipment shall not be operated in live streams except as may be required to construct channel changes and temporary or permanent structures.

The location of all local material pits, other than commercially operated sources, and all waste areas shall be subject to the approval of the Engineer, and construction operations in these areas shall be so scheduled and conducted that during and after completion of the work, erosion will not result in water pollution.

107.21.2-Pollution: The Contractor shall exercise every reasonable

precaution throughout the life of the Project to prevent pollution of rivers, streams, or impoundments. Pollutions such as chemicals, fuels, lubricants, bitumens, raw sewage, products associated with bridge cleaning and painting, and other harmful wastes shall not be discharged into or alongside of rivers, streams, impoundments, or into natural or man-made channels leading thereto. The quality of the surface waters affected by construction shall meet the requirements of the West Virginia Code, Volume 8A, Chapter 22, Article 11.

The manual entitled, "West Virginia Division of Highways, Best Management Practice for Containment/Disposal of Waste Products Generated During Bridge Cleaning and Painting Activities". Latest addition, as amended is made part of the contract as a guide to follow for containment/disposal activities.

107.21.3-Basis of Payment: Except when pay items are specifically described and furnished as pay items in [642](#), Temporary Pollution Control, the water pollution and erosion and siltation control requirements set forth shall be at the expense of the Contractor.

107.22-PLANT PEST REGULATIONS:

The indiscriminate movement of nursery stock, hay or straw mulch, equipment and soil samples into and out of West Virginia constitutes a potential hazard to State and National Agriculture. Therefore, it shall be the responsibility of the prime Contractor to comply with all applicable State and Federal Plant Pest Regulations in the fulfillment of this contract.

Information regarding these regulations may be obtained from Plant Pest Control Division, West Virginia Department of Agriculture, Charleston, West Virginia 25305, or United States Department of Agriculture, Agriculture Research Service, Plant Pest Control Division, P.O. Box 1257, Roanoke, Virginia 24001.

107.23-AIR POLLUTION CONTROL:

The Contractor shall exercise every reasonable precaution throughout the life of the project to keep air pollution to a minimum. The Contractor shall also comply with the applicable regulations of the West Virginia Air Pollution Control Commission. During times of limited dispersion, construction operations may be suspended.

All plants in West Virginia producing bituminous concrete for the Division shall obtain a permit or certification from the West Virginia Air Pollution Control Commission.

107.24 - CLEAN WATER ACT/WETLANDS:

The Contractor will comply with all aspects of Section 404 of the Clean Water Act including any and all regards to wetlands on all work associated with the project. A wetland will not be filled or disturbed on the project or any work related to the project such as a haulroad, waste area, borrow pit or any other activity without a permit.

107.25 – LEAD EXPOSURE IN CONSTRUCTION

The Contractor will comply with all aspects of 29CFR, Part 1926, Lead Exposure in Construction, by the United States Department of Labor, Occupational Safety and Health Administration.

SECTION 108 PROSECUTION AND PROGRESS

108.1-SUBLETTING OF CONTRACT:

The Contractor shall not sublet, sell, transfer, assign, or otherwise dispose of the Contract or Contracts or any portion thereof, or of their right, title, or interest, without written approval of the Engineer prior to any of the subject work being performed. The Contractor will be permitted to sublet a portion thereof but shall perform, with their own organization, work amounting to not less than 50 percent of the total contract cost, except that any items designated in the Contract as "specialty items" may be performed by subcontract and the cost of any such specialty items so performed by subcontract may be deducted from the total cost before computing the amount of work required to be performed by the Contractor with their own organization. No subcontracts, or transfer of contract, shall in any case release the Contractor of their liability under the Contract and Bonds.

The Contractor shall request the approval of each subcontractor, including lower-tier subcontractors. Each subcontract, including lower-tier subcontracts, shall be in writing and shall physically contain all of the applicable provisions, requirements and specifications. The Contractor may certify that a copy of all the applicable provisions, requirements and specifications has been provided and is physically incorporated in each subcontract including lower-tier subcontracts. Requests for approval of DBE subcontractors, however, shall also be accompanied by a copy of the proposed subcontract without the required attachments.

The Contractor shall maintain a complete subcontract file including lower-tier subcontractors at the home office which shall be available to authorized personnel for review without notice or at any other appropriate location as determined by the Division after a five day notice. Such file may contain a single copy of all the applicable provisions, requirements and specifications in lieu of individual subcontract files containing the applicable attachments.

Roadside production of materials is construed to be the production of crushed stone, gravel, or other materials with portable or semi-portable crushing, screening or washing plants established or re-opened in the vicinity of the work for the purpose of supplying materials to be incorporated into the work on a designated project or projects and in all cases, unless performed by the Contractor, shall be considered as subcontracting.

The purchase of sand, gravel, crushed stone, crushed slag, batched concrete aggregates, ready mixed concrete or any other materials produced at and

furnished from established and recognized commercial plants, together with the delivery of such materials to the site of work by means of vehicles owned or operated by such plants or by recognized commercial hauling companies, shall not be considered as subcontracting under these provisions.

Except as stated, all hauling of materials from roadside production sources, or from railroad or water delivery points, to batching plants, mixing plants, or directly to their place of use in the road, and all hauling of materials from batching plants and mixing plants to their place of use in the road, unless done by the Contractor's own equipment or by recognized hauling companies, shall be considered as subcontracting under these provisions.

If batching plants or mixing plants are set up at rail or water delivery points and materials in part supplied to such plants by rail or water transportation companies, the remaining materials required at such batching or mixing plants may be hauled to such plants without such hauling being considered as subcontracting.

108.2-NOTICE TO PROCEED:

The "Notice to Proceed" will stipulate the date on which it is expected the Contractor shall begin the construction and from which date contract time will be charged. Commencement of work by the Contractor may be deemed and taken as a waiver on their part of this notice.

108.3-PROSECUTION OF THE WORK:

108.3.1-GENERAL: The Contractor shall provide sufficient materials, equipment, and labor to guarantee the completion of the project in accordance with the Plans and Specifications within the time set forth in the Proposal.

The Contractor shall submit a Detailed Construction Schedule and any subsequent schedules, as required by this specification, in the form of an Activities Schedule Chart (ASC) or a Critical Path Method (CPM) Schedule with all graphic and tabular supporting documentation, hereinafter referred to as "Schedule".

Schedules will not be required for projects on which the major portion of the work is resurfacing, landscaping, signing, lighting, installing signals, guardrail or bridge painting or on which the Contract Bid Amount is \$1,000,000 or less.

Critical Path Method (CPM) Schedules will be required for all projects on which the Contract Bid Amount is equal to or exceeding \$5,000,000 or containing an I/D Clause.

The submitted Schedule shall include a written certification on the face of the schedule, as well as on any diagrams and drawings stating that the Schedule is within the contractual limits and that the submitted Schedule is the only schedule the Contractor will use for all critical work activities, interdependent work activities, phase construction, stage construction, resource needs, transmittals for Contractor designs, drawings and other submissions, activities for subcontractors, vendors, and suppliers, and all other controlling

108.3.1.1

and subsequent activities. This same written certification shall be included on all Schedule updates and revisions.

The Schedule shall show the interdependent and logical sequence of construction activities. The Schedule shall reflect that all contract time requirements are essential conditions of the Contract and shall also include allowances for seasonal weather conditions, the influence of high or low ambient temperatures, as well as any extra shifts, overtime, or additional manpower and equipment necessary to complete the critical and non-critical activities within the allotted contract time without additional cost to the Division.

Should the Schedule indicate an earlier completion than the time for completion set forth in the Contract, the Schedule shall define any float developed between an early completion point and the Contract completion date as part of the project float. It is understood by the Contractor and the Division that float is a shared commodity, not for the exclusive use or benefit of either party. Either party has the full use of the float until it is depleted. Time extensions will only be considered when the delay exceeds the remaining float time on the activity(s) affected by a change.

The Division's review of the Schedule does not represent approval of the Contractor's estimate of resources (labor, material and equipment), method of operation, or production rates.

108.3.1.1-SUBMISSION OF CONSTRUCTION SCHEDULES: No item of work under the contract may be pursued following the "Notice to Proceed" until a Preliminary Construction Schedule or Detailed Construction Schedule has been submitted by the Contractor and reviewed by the Engineer.

The Contractor shall designate a competent representative, hereinafter referred to as Construction Coordinator, who shall have the decision-making authority for the Contractor to control the work in accordance with the Schedule(s) for the duration of the Contract.

108.3.1.2-PRELIMINARY CONSTRUCTION SCHEDULE: Within thirty (30) calendar days of the contract award date, the Contractor may submit a sixty (60) calendar day Preliminary Construction Schedule for review by the Engineer. The preliminary Schedule shall include a generalized project schedule for the balance of the work in summary form meeting the contract completion date. The Contractor shall maintain and submit monthly a sixty (60) calendar day Preliminary Construction Schedule until the Detailed Construction Schedule is submitted by the Contractor and reviewed by the Engineer

108.3.1.3-DETAILED CONSTRUCTION SCHEDULE: The Detailed Schedule shall include a report system that is maintained throughout the life of the project to measure all factors that affect the completion date. Within sixty (60) calendar days of the contract award date, the Contractor shall submit a Detailed Construction Schedule meeting the contract completion date for review by the Engineer.

The Engineer will review the Detailed Construction Schedule and supporting documentation for compliance with the Contract within seven (7) calendar days after receipt in accordance with provision 108.6.2. The Contractor shall provide the Engineer with a revised Detailed Schedule incorporating any recommendations made in the Engineer's review, which schedule shall become the official Schedule and shall be used by the Contractor. The official Schedule must be completed within ninety (90) calendar days of the contract award date. The Engineer will not release further current estimate payments for any item of work under the Contract after ninety (90) calendar days until the Contractor's official Detailed Construction Schedule is submitted.

108.3.1.4-CONSTRUCTION SCHEDULE REQUIREMENTS: The Preliminary Schedule and the official Detailed Construction Schedules shall be submitted in hard copy and shall include a legend for symbols and abbreviations used. Activities with duration times in excess of fifteen (15) working days, except for non-construction activities, shall be kept to a minimum and be subject to review by the Engineer. The Schedule shall provide a minimum of 20 activities or categories, hereafter referred to as "activities", per million dollar value of the Contract and a maximum of 300 activities or as directed by the Engineer.

The Schedule shall indicate the interdependence of activities (how the start of a given activity depends on the completion of preceding activities) and the sequence of work (how failure to complete a given activity may restrain the start of following activities).

The Schedule shall include the Contract completion date and any interim completion dates contained in the Contract, as well as any coordination and cooperation requirements, construction restrictions or other requirements of the Contract.

The Schedule shall include activities for all work required by the Contract, including activities for subcontractors, vendors, and suppliers. In addition to construction activities, the Schedule shall include as a minimum the procurement, fabrication and delivery of critical or special materials and equipment, as well as submission and review of all shop/work drawings, Contractor designs and all other submissions required by the Contract.

The activities are to be described by contract item number, location, phase, and sequence so that the work is readily identifiable and the progress of each activity can be measured. The dollar value designated for each activity shall be based on the amount of labor, material and equipment involved. The sum of all activity dollar values shall equal the Contract amount. Activity duration shall be logical and consistent with the Contract documents and shall be based on realistic and available resources of the Contractor.

The above requirements are applicable for all ASC and CPM Schedules, including the Preliminary Schedule and the official Detailed Construction Schedules, required updates, and any revised Schedules.

Requiring the Contractor to submit Schedules allocating resources to

108.3.2

project activities does not imply acceptance, approval or agreement by the Division that the Contractor's scheduled allocation of resources is sufficient to complete either the project or a scheduled activity in a scheduled time.

108.3.2-ACTIVITIES SCHEDULE CHART (ASC) SCHEDULE: The Schedule shall be submitted as a written narrative accompanied by bar chart, chronologically sequenced and to time scale, showing construction prosecution or preparation, including an activity description, for each activity, as well as its duration by working days (for working day Contracts only) or calendar days. The controlling operation must be distinguished from other operations on the schedule. The duration represented by a bar shall note periods of non-work when the non-working period exceeds three (3) consecutive calendar days. The percentage of completion for each activity for each month, based on the monetary value of the work, shall be listed in numbers above the bar chart.

108.3.3-CRITICAL PATH METHOD (CPM) SCHEDULE: The Schedule shall be in CPM Network Schedule precedence format. Refer to "The Use of CPM in Construction – A Manual for General Contractors and the Construction Industry," published by the Associated General Contractors of America (AGC).

The precedence diagram shall be submitted on standard D size sheets (24" x 36"). The critical path shall be distinguished from other paths on the Schedule. All back-up data used to generate the Schedule shall be submitted in digital form on electronic disk(s) using the current version of the "P3" scheduling and cost control system by Primavera Systems, Inc. to allow for direct digital entry of data into the Engineer's system.

The Schedule shall include the following data for each activity in the initial submittal and in all updates and revisions:

1. Activity number, as well as preceding and following activity numbers;
2. Activity description;
3. Duration of activity, in working days;
4. All quantities in accordance with pay items;
5. Number of work days per week for activity;
6. Number of shifts per work day and hours per shift for activity;
7. Major equipment and corresponding hours for activity;
8. Manpower by Trade or entity and corresponding hours for activity;
9. Dollar value of activity;
10. Remaining duration of activity, in working days;
11. Earliest start date, by calendar date;
12. Earliest finish date, by calendar date;
13. Actual start date, by calendar date;
14. Actual finish date, by calendar date;
15. Latest start date, by calendar date;

16. Latest finish date, by calendar date;
17. Total float for activity;
18. Free float for activity.

108.3.4-PROGRESS REPORTING AND SCHEDULE UPDATING:

The Contractor shall submit weekly a summary of work force by Trade including all workmen and subcontractors together with a weekly summary of all equipment used on the project. The Division shall maintain the Contractor's resource information in a confidential manner.

A Project Control Meeting shall be held monthly by the Engineer with the Contractor's Construction Coordinator to review actual progress, planned progress for the next period, and any changes since the previous update(s). Two (2) working days before the meeting, the Construction Coordinator shall provide the Engineer with a complete update of all schedule activity information included in 108.3.2 and 108.3.3 above.

The Contractor shall submit with the monthly update a narrative report which shall include, but not be limited to, a description of progress along the critical path in terms of days ahead or behind the Schedule dates, any problem areas (current and anticipated), any delaying factors and their impact, and an explanation of any corrective actions taken or proposed. The narrative report shall state any and all changes made in the Schedule since the previous update(s) and detail all activities or portions of activities, including dollar value, completed during the update period.

Extension of interim completion dates or the contract completion date will be governed by the provisions of 108.6.

If the Division revises work which would affect the sequence of operations or duration of time on work activities, the Contractor shall submit to the Engineer, within seven (7) calendar days after receipt of the revision, a written report in accordance with 108.6 outlining the effect on work time and cost that the revision is expected to have on the Schedule.

Should the Contractor fail to submit a monthly Schedule update for review when due, the Engineer will not release further current estimate payments for any item of work under the Contract until such Schedule is submitted.

108.3.5-SUBMISSION OF REVISED CONSTRUCTION SCHEDULE:

The Engineer shall request the Contractor to submit a revised Schedule when any one of the following conditions is reflected by the latest Schedule:

1. A delay greater than ten (10) calendar days in the completion of any critical activity.
2. The performance of any work in a sequence or manner which varies from that represented on the Schedule.
3. The addition, deletion or revision of activities required by Contract modification.

108.4

The revised schedule shall indicate all additional resources (labor, material and equipment) and modification(s) of operations necessary to meet the contract time requirements.

The Engineer will review the Revised Construction Schedule and supporting documentation for compliance with the Contract. The Contractor shall incorporate any recommendations made in the Engineer's review.

Should the Contractor fail to submit a revised Schedule within seven (7) calendar days of the Engineer's written request, the Engineer will not release further current estimate payments for any item of work under the Contract until such Schedule is submitted.

108.4-LIMITATION OF OPERATIONS:

The Contractor shall conduct the work at all times in such manner and in such sequence as will assure the least interference with traffic. The Contractor shall have due regard to the location of detours and to the provisions for handling traffic. The Contractor shall not open up work to the prejudice or detriment of work already started, and the Engineer may require the Contractor to finish a section on which work is in progress before work is started on any additional sections if the opening of such section is essential to public convenience.

108.5-CHARACTER OF WORKERS; METHODS AND EQUIPMENT:

The Contractor shall at all times employ sufficient labor and equipment for prosecuting the several classes of work to full completion in the manner and time required by these Specifications.

All employees shall have sufficient skill and experience to perform properly the work assigned to them. Employees engaged in special work or skilled work shall have sufficient experience in such work and in the operation of the equipment required to perform all work properly and satisfactorily.

Any person who, in the opinion of the Engineer, does not perform their work in proper and skillful manner or is intemperate or disorderly shall, at the request of the Engineer, be removed forthwith. Any Contractor or their subcontractor employing such person shall not reemploy such person on the project without the written approval of the Engineer.

Should a Contractor fail to remove such a person or persons as required above, or fail to furnish suitable and sufficient personnel for the proper prosecution of the work, the Engineer may suspend the work by written notice until such order is complied with.

All equipment which is proposed to be used on the work shall be of sufficient size and in such mechanical condition as to meet requirements of the work and to produce a satisfactory quality of work. Equipment used on any portion of the project shall be such that no injury to the roadway, adjacent property, or other highways will result from its use.

When the methods and equipment to be used by the Contractor in accomplishing the construction are not prescribed in the Contract, the

Contractor is free to use any methods or equipment that the Contractor demonstrates to the satisfaction of the Engineer will accomplish the contract work in conformity with the requirements of the Contract.

When the Contract specifies that the construction be performed by the use of certain methods and equipment, such methods and equipment shall be used unless others are authorized by the Engineer. Should the Contractor desire to use a method or type of equipment other than specified in the Contract, the Contractor shall request authority from the Engineer to do so. The request shall be in writing and shall include a full description of the methods and equipment proposed to be used and as explanation of the reasons for desiring to make the change. If approval is given, it will be on the condition that the Contractor shall be fully responsible for producing construction work in conformity with contract requirements. If, after trial use of the substituted methods or equipment, the Engineer determines that the work produced does not meet contract requirements, the Contractor shall discontinue the use of the substitute methods or equipment and shall complete the remaining construction with the specified methods or equipment. The Contractor shall remove the deficient work and replace it with work of specified quality, or take such other corrective action as the Engineer may direct. No change will be made in basis of payment for the construction items involved nor in contract time as result of authorizing a change in method or equipment under these provisions.

108.6-DETERMINATION AND EXTENSION OF CONTRACT TIME:

108.6.1-GENERAL: The Division shall determine and specify in the Contract the number of working days and/or a fixed calendar date allowed for completion of the Work, hereinafter called Contract time.

A potential working day is every day on the calendar except Saturday, Sunday and holidays as set forth in [101.42](#).

When the Contract time is specified on a working day basis, the Engineer will inform the Contractor weekly, by written statement, of the number of working days charged for the preceding week, the accumulated number of working days charged against the Contract and number of working days remaining for completion of the Contract. The Contractor shall submit in writing to the Engineer any protest concerning the weekly statement within seven (7) calendar days after receipt of the statement. The written protest shall set forth what the Contractor considered incorrect, along with supporting information; otherwise, the statement shall be deemed to have been accepted by the Contractor as correct. The Engineer shall review any such protest and supporting information and shall render a decision either affirming or correcting the number of working days previously reported for the contested week.

When the Contract time is specified on a fixed calendar date basis, it will consist of the number of calendar days counting from the effective date of the Engineer's issuance of the Notice to Proceed to the calendar date specified

108.6.2

for completion of the project, including all Saturdays, Sundays, holidays and non-working days. All calendar days elapsing between the effective dates of any orders of the Engineer to suspend Work and to resume Work for suspensions not the fault of the Contractor shall be excluded.

When the Work on the Contract is substantially complete so that the Project could be opened continuously for the safe, convenient, and unimpeded use of the traveling public, as determined solely by the Engineer, the Contract time charges shall be discontinued prior to final acceptance being made by the Engineer as prescribed in 105.16.

108.6.2-EXTENSION OF CONTRACT TIME: The Contractor shall be responsible for any delays caused by failing to start work activities on the early start dates, the earliest date any activity can begin after its' predecessors have been completed, unless the activity has float. The Contractor shall also be responsible for any delays caused by lack of continuous effort, inadequate allocation and scheduling of resources and coordination of the work, inadequate or insufficient application of resources, or inability to meet interim completion dates due to Contractor's approach to the work. Such delays shall not be considered for an extension of interim completion dates or the contract completion date.

If the Contractor finds it impossible for reasons beyond his control to complete the Work within the Contract time as specified or as extended according to the provisions of this Section, the Contractor shall make a written request to the Engineer within seven (7) calendar days for an extension of time.

The Contractor shall notify the Engineer, in writing, within seven (7) calendar days if a problem develops requiring direction to the Contractor by the Engineer or after the occurrence of any delay including delays in critical path activities or, in the absence of a CPM schedule, delays in the controlling operation during the prosecution of Work that the Contractor believes may warrant revision of an interim completion date or the contract completion date. The notification shall set forth therein the reasons that shall justify the granting of the request, and as a minimum, identify the cause(s) for the delay; the particular critical path activity(s) or controlling operation(s) affected, the affect of any Division act or omission on each activity or operation delayed, and the significant dates that encompass the periods of delay. The notification shall be considered by the Division as a request by the Contractor for a contract time extension.

If notification is not given within the prescribed time, or if, having given notification as provided herein, the Contractor does not afford the Engineer proper facilities for keeping strict account of actual costs and loss of time, the Contractor waives any claim for additional compensation and Contract time extension. Delay costs allegedly incurred before notifying the Engineer, in the manner provided herein, that operations have been delayed shall not be allowed.

If the Engineer determines that the Work was delayed because of conditions beyond the control of and without the fault or negligence of the

Contractor, the Engineer may extend the time for project completion as the conditions justify.

Only delays in the activities on the critical path or, in the absence of scheduling requirements, delays in the controlling operation will be considered for a contract time extension provided, when required, the Contractor has submitted proper notification and supporting documentation justifying the request. The Engineer shall promptly advise the Contractor in writing of the approval or rejection of the time extension request. The extended time for completion shall then be in full force and effect the same as though it were the original time for completion.

108.6.2.1-EXCUSABLE NONCOMPENSABLE DELAYS:

An excusable noncompensable delay is a delay in the critical path activity or, in the absence of a CPM schedule, a delay in the controlling operation that was beyond the Contractor's control and not caused by the Contractor's fault or negligence. Consideration may be given to an adjustment in Contract time, but no consideration shall be given for additional monetary compensation. Excusable noncompensable delays include:

- A.** Delay of Notice to Proceed more than thirty (30) calendar days (seven (7) calendar days on contracts with Incentive/Disincentive clauses) after the contract letting date for reasons beyond the control of and without the fault or negligence of the Contractor. Consideration for an adjustment of Contract time will be limited to the number of calendar days in excess of thirty (30) calendar days (seven (7) calendar days on contracts with Incentive/Disincentive clauses), counting from the Contract letting date to the effective date of the Engineer's issuance of the Notice to Proceed.
- B.** Delays due to Acts of God, labor strike (not within the Contractor's power to settle) freight embargoes, state of national emergency or other reasons beyond the control of the Contractor. Consideration for an adjustment of contract time shall be limited to the number of potential working days lost as determined by the Engineer.
- C.** Delays in obtaining materials due to extraordinary market conditions caused by industry wide strike, natural disaster, area-wide shortage, official federal declaration that a material is critical due to national defense efforts, or for other reasons beyond the control of the Contractor. Consideration for an adjustment of contract time shall be limited to the number of potential working days lost as determined by the Engineer.
- D.** Delays due to adverse weather from April 1 to November 30.

108.6.2

An adjustment of contract time shall not be considered for loss of time due to adverse weather:

- i) before the start of construction operations,
- ii) after November 30 and before April 1 of the following year;
- iii) during periods other than on-site time, nor;
- iv) after the Contract completion date.

Consideration for an adjustment of contract time shall be limited to the number of potential working days lost each month, as determined by the Engineer, in excess of twenty (20)% of the potential working days within that month or portion thereof.

108.6.2.2-EXCUSABLE COMPENSABLE DELAYS: An excusable compensable delay is a delay in the critical path activity or, in the absence of a CPM schedule, a delay in the controlling operation that was caused solely by the Department. An adjustment in Contract time may be considered along with additional monetary compensation, if entitled. Excusable compensable delays include:

- A. Delays in a critical path activity or, in the absence of a CPM schedule, a delay in the controlling operation due to contract modifications resulting in the performance of added Work, revised Work, or Work in greater quantities than those set forth in the Proposal. The Division reserves the right to negotiate unit prices that includes the cost for additional resources (labor, material and equipment) required to complete added Work, revised Work, or Work in greater quantities within the originally scheduled dates, thereby negating the need for a contract time adjustment.

Consideration for adjustment of Contract time for added or revised Work shall be limited to the extra time allowances as agreed on and specified in the Change Order that covers the added or revised Work.

Any adjustment of Contract time for Work authorized in accordance with [104.11](#) that requires the performance of Work in greater quantities than those specified in the Contract shall be made at the discretion of the Engineer in accordance with one of the two options below:

- 1. The extra time allowances as agreed on and specified in the Change Order that covers the additional or increased Work; or
- 2. The same ratio that the total cost of the added or increased work shall bear to the total contract bid amount, provided the added or increased work is judged to be a critical path activity or, in the absence of a CPM schedule, a

controlling operation.

- B.** Loss of time due to differing site conditions. Consideration for adjustment of Contract time shall be according to section 104.9.
- C.** Loss of time due to any written orders of the Engineer suspending work or delaying critical path activities on the project not the fault of the Contractor. Consideration for adjustment of contract time shall be according to section 104.10.
- D.** Loss of time due solely to acts or omissions by the Division and not caused or contributed to by the Contractor's fault or negligence.

The normal time required for the Division to take action on properly prepared programs such as an acceptable on-the-job training program, a temporary pollution control program, shop drawings, mill test reports, or other submissions as required by the Contractor shall be considered to be seven (7) calendar days after receipt.

Consideration for an adjustment of contract time shall be limited to the number of potential working days lost as determined by the Engineer.

108.7 – COMPLETION DATES:

108.7.1 – FAILURE TO COMPLETE ON TIME AND LIQUIDATED DAMAGES: Time is an essential element of the Contract and it is important that the work be completed within the time specified. The cost to the Division for the administration of the Contract, including engineering, inspection and supervision, will increase as the time required to complete the work is increased.

Therefore, the Division will assess liquidated damages against the Contractor for each calendar day any work remains uncompleted during the months of April through November after the contract time specified for completion of the work, subject to such extensions of contract time required or permitted in 108.6. Daily charges will be deducted for each calendar day, as defined in 101.10, on all contracts, except daily charges will not be deducted on any contract between November 30 and April 1. The total amount of daily charges will be deducted from any monies due the Contractor, not as a penalty but as liquidated damages. Unless specified elsewhere in the contract, the amount of the daily charge will be calculated from TABLE 108.7.1.

TABLE 108.7.1
SCHEDULE OF LIQUIDATED DAMAGES

ORIGINAL CONTRACT AMOUNT		DAILY CHARGE
FROM MORE THAN	TO AND INCLUDING	PER CALENDAR DAY
0	25,000	120
25,000	100,000	150
100,000	500,000	290
500,000	1,000,000	490
1,000,000	2,000,000	840
2,000,000	5,000,000	1,390
5,000,000	10,000,000	2,220
10,000,000	-----	3,870

108.7.2 - Interim Completion Date: When an interim completion date has been specified in the contract documents for the Contractor to complete a specific amount of work, pay item, or structure, and if the Contractor fails to meet the interim date, the Division will assess a per calendar day charge, as liquidated damages, as specified elsewhere in the contract documents until such amount of work, pay item, or structure has been completed. Extension of interim completion dates will be governed by the provisions of 108.6. The liquidated damages provided for in this subsection are in addition to those provided for elsewhere in this section.

108.7.3 - Incentive/Disincentive for Early Completion: When an Incentive/Disincentive (I/D) provision has been included in the contract documents, Subsection 108.7.1 relating to liquidated damages remains in effect and is applicable to the total contract time; however, there will be concurrent assessment of liquidated damages with disincentive assessments. Extension of the date(s) established for completion of work stages covered by the I/D provision and/or the contract completion date will be governed by the provisions of 108.6.

108.8-DEFAULT AND TERMINATION OF CONTRACT:

If the Contractor:

- i. fails to begin work under the Contract within the time specified in the "Notice to Proceed",
- ii. fails to perform the work with sufficient employees and equipment or with sufficient materials to assure the prompt completion of the work,
- iii. performs the work unsuitably or neglects or refuses to remove materials or to perform anew such work as may be rejected as unacceptable and unsuitable,
- iv. discontinues the prosecution of the work,
- v. fails to resume work, which has been discontinued, within a reasonable time after notice to do so,

- vi. becomes insolvent or is declared bankrupt, or commits any act of bankruptcy or insolvency,
- vii. allows any final judgment to stand against the Contractor unsatisfied for a period of 10 days,
- viii. makes an assignment for the benefit of creditors, or
- ix. for any other cause whatsoever, fails to carry out the contract terms in an acceptable manner, the Engineer will give notice in writing to the Contractor and their surety of such delay, neglect or default.

If the Contractor or Surety, within a period of 10 days after such notice, shall not proceed in accordance therewith, the Division will, upon written notification from the Engineer of the fact of such delay, neglect or default and the Contractor's failure to comply with such notice, have full power and authority, without violating the Contract, to take the prosecution of the work out of the hands of the Contractor. The Division may appropriate or use any or all materials and equipment on the ground as may be suitable and acceptable and may enter into an agreement for the completion of the contract according to the terms and provisions thereof, or use such other methods as in the opinion of the Engineer will be required for the completion of the Contract in an acceptable manner.

All cost charges incurred by the Division, together with the cost of completing the work under Contract, will be deducted from any monies due or which may become due the Contractor. If such expense exceeds the sum which would have been payable under the Contract, then the Contractor and the surety shall be liable and shall pay to the Division the amount of such excess.

108.9-TERMINATION OF CONTRACT FOR CONVENIENCE OF THE STATE:

The Division may terminate the entire Contract or any portion thereof, if the Engineer determines that a termination is in the Division's interest. The Engineer will deliver to the Contractor a Notice of Termination specifying the extent of termination and the effective date.

- A. Submittals and Procedures.** After receipt of a Notice of Termination, the Contractor shall immediately proceed with the following obligations:
1. Stop work as specified in the notice.
 2. Place no further subcontracts or orders for materials, services, or facilities, except as necessary to complete the continued portion of the Contract.
 3. Terminate all subcontracts to the extent they relate to the work terminated.
 4. Settle all outstanding liabilities and termination settlement Proposals arising from the termination of the contract or portion thereof.

5. Transfer title and deliver to the Division (1) fabricated, partially fabricated, or unfabricated parts, work in process, completed work, supplies, and other material produced or acquired for the work terminated, and (2) the completed or partially completed plans, drawings, information, and other property that, if the Contract had been completed, would be required to be furnished to the Division.
6. Complete performance of the work not terminated.
7. Acceptable materials obtained by the Contractor for the Project that have not been incorporated in the work shall be inventoried in conjunction with the Engineer at a date identified by the Engineer.
8. Take any action necessary, or that the Engineer may direct, for the protection and preservation of the property related to the Contract that is in the possession of the Contractor and in which the Division has or may acquire an interest.

B. Settlement Provisions. When the Division orders termination of all or a part of the Contract effective on a certain date, completed items of work as of that date will be paid for at the Contract bid price. Payment for partially completed work will be made either at agreed prices or under the provisions below. Items that are eliminated in their entirety by such termination shall be paid for as provided in Subsection [109.5](#).

1. **Additional Costs.** Within sixty working days of the effective termination date, the Contractor shall submit a claim for additional damages or costs not covered above or elsewhere in the Contract. Such claim may include such cost items as reasonable idle equipment time, mobilization efforts, bidding and project investigative costs, overhead expenses attributable to the project terminated, legal and accounting charges involved in claim preparation, subcontractor costs not otherwise paid for, actual idle labor cost if work is stopped in advance of termination date, guaranteed payments for private land usage as part of the original Contract, and any other cost or damage for which the Contractor feels reimbursement should be made. Anticipated profits will not be considered as part of any settlement.

The Contractor and the Division may agree upon the whole or any part of the amount to be paid because of the termination.

The amount may include a reasonable allowance for profit on work done. The agreed amount may not exceed the total Contract price as reduced by the amount of payments previously made, and the Contract price of work not terminated. The Contract shall be amended, and the Contractor paid the agreed

amount.

2. **Additional Cost Review.** If the Contractor and the Division fail to agree on the whole amount to be paid the Contractor because of the termination of work, the Division will pay the amounts determined as follows, but without duplication of any amounts agreed upon above:
 - a. For Contract work performed before the effective date of termination, the total (without duplication of any items) of:
 1. The cost of work performed;
 2. The cost of settling and paying termination settlement Proposals under terminated subcontracts that are properly chargeable to the termination portion of the Contract if not included in subparagraph 1 above; and
 3. A sum, as profit on (1) above determined by the Division to be fair and reasonable. The Division shall allow no profit under this subdivision if the Contractor's costs incurred on work performed exceed the bid item payments made.
 - b. The reasonable costs of settlement of the work terminated, including:
 1. Accounting, legal, clerical, and other expenses reasonably necessary for the preparation of termination settlement Proposals and support data;
 2. The termination and settlement of subcontracts (excluding the amounts of such settlements); and
 3. Storage, transportation, and other costs incurred, reasonably necessary for the preservation, protection, or disposition of the termination inventory.
 - c. Except for normal spoilage, and to the extent that the Division expressly accepts the risk of loss, Division will exclude from the fair value, as that is destroyed, lost, stolen, or damaged so as to become undeliverable to the Division or to the buyer.
 - d. In arriving at the amount due the Contractor under this clause, there will be deducted--
 1. All unliquidated advance or other payments to the Contractor under the terminated portion of the Contract;

2. Any claim that the Division has against the Contractor under the Contract; and
3. The agreed price for, or the proceeds from the sale of materials, supplies, or other things acquired and sold by the Contractor not recovered by or credited to the Division.

If termination is partial, the Contractor may file a Proposal with the Division for an equitable adjustment of the price(s) of the continued portion of the Contract. The Division will make any equitable adjustment agreed upon. Any Proposal for an equitable adjustment under this clause shall be requested within sixty working days from the effective date of termination unless extended in writing by the Engineer.

The Division may, under the terms and conditions it prescribes, make partial payments and payments against costs incurred by the Contractor for the termination portion of the Contract, if these payments will not exceed the amount to which the Contractor is entitled.

The Contractor shall maintain and make available all project cost records to the Division for audit to the extent necessary to determine the validity and amount of each item claimed. This includes all books and other evidence bearing on the Contractor's costs and expenses under the Contract. These records and documents shall be made available to the Division at the Contractor's office, at all reasonable times, without any direct charge. If approved by the Division, photographs, microphotographs, or other authentic reproductions may be maintained instead of original records and documents.

Termination of the Contract or portion thereof shall not relieve the Contractor of contractual responsibilities of the work completed, nor shall it relieve the Surety of its obligation for and concerning any just claim arising out the work performed.

SECTION 109

MEASUREMENT AND PAYMENT

109.1-MEASUREMENT OF QUANTITIES:

All work completed under the Contract will be measured by the Engineer according to United States standard measure.

The method of measurement and computations to be used in determining of quantities of materials furnished and of work performed under the Contract will be those methods generally recognized as conforming to good engineering practice.

Unless otherwise indicated, the requirements prescribed shall govern.

Earthwork will be computed by the average end area method, using the horizontal length measured along the centerline as the distance between sections, applying corrections for curvature where the apparent error exceeds 25 percent of the volume in any one cut. Other acceptable methods may be used.

Unless otherwise specified, longitudinal measurements for area computations will be made horizontally and no deductions will be made for individual fixtures having an area of nine square feet (one square meter) or less.

Unless otherwise specified, transverse measurements for area computations will be the neat dimensions shown on the Plans or ordered in writing by the Engineer.

Structures will be measured according to neat lines shown on the Plans or as altered to fit field conditions.

All items which are measured by the linear foot (meter), such as pipe culverts, guardrail, underdrains, etc., will be measured parallel to the base or foundations upon which such structures are placed.

The term "gage" when used in connection with the measurements of plates, will mean the U.S. Standard Gage.

The galvanized sheet thicknesses to be used in the manufacture of metal cribbing, corrugated steel culvert pipe, underdrain pipe, plate pipe, pipe arches, plate pipe arches and plate arches shall be as specified in AASHTO M 36 or AASHTO M 167. The sheet thicknesses to be used in the manufacture of corrugated aluminum alloy culvert pipe, underdrain pipe, plate pipe, pipe arches, plate pipe arches and plate arches shall be as specified in AASHTO M 196 or AASHTO M 219.

The "size number" used in the measurement of wire will be as specified in AASHTO M 32 or AASHTO M 225.

The term ton will mean the short ton consisting of 2,000 lb (The term megagram is defined as a mass of 1,000 kg). All materials which are measured or proportioned by weight shall be weighed on approved scales by competent, qualified personnel. Scales for weighing shall be of either the beam type, springless-dial type or digital recorder type. All plant and truck scales and metering devices shall be inspected, approved and sealed in accordance with the requirements of the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political

109.1

subdivisions. Poises shall be designed to be locked in any position to prevent unauthorized changes. When the beam type scales are used, provisions for a "telltale" dial shall be made for indicating to the operator that the required load in the weighing hopper is being approached. A device on the weighing beams shall clearly indicate the critical position.

If material is shipped by rail, the car weight may be accepted provided the actual weight of material only will be paid for. However, car weights will not be acceptable for material to be passed through mixing plants. Trucks used to haul materials being paid for by weight shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales.

Devices, used to meter or measure component or other materials in a simultaneous manner, shall be located so as to be readily accessible and visible to a single Inspector, unless otherwise directed by the Engineer.

Materials to be measured by volume in the hauling vehicle shall be hauled in approved vehicles and measured at the point of delivery. Vehicles for this purpose may be of any size or type acceptable to the Engineer, provided that the body is of such shape that the actual contents may be readily and accurately determined. All vehicles shall be loaded to at least their water level capacity, and all loads shall be leveled when the vehicles arrive at the point of delivery.

When approved by the Engineer, material specified to be measured by the cubic yard (meter) may be weighed and these weights converted to cubic yard (meter)s for payment purposes. Further, when it is impractical to measure the material by weighing, or in its original position, the material will be measured in its final position and adjusted by a volume change factor. These conversion factors will be determined by the Engineer and shall be agreed to by the Contractor before these methods of measurement are used.

When bituminous material is measured by volume, the measured volume at loading temperature shall be converted to volume at 60° F (15° C) using the temperature correction factors in 705 for asphaltic materials and 706 for tar materials, except that when volume is measured by an approved temperature compensated metering device, no further volume correction for temperature shall be required. When bituminous material is measured by weight, the actual specific gravity, API gravity, or weight per gallon (liter) of the material shall be used to convert the measured weight to volume at 60° F (15° C). The Contractor shall furnish all information necessary as determined solely by the Division to determine the amount of bituminous material actually incorporated into the project.

Net certified scale weights or weights based on certified volumes in the case of rail shipments will be used as a basis of measurement, subject to correction when bituminous material has been lost from the car or the distributor, wasted, or otherwise not incorporated in the work.

When bituminous materials are shipped by truck or transport, net certified weights or volume, subject to correction for loss or foaming may be used for computing quantities.

Cement will be measured by the cwt (hundredweight = 100 lb) (kilogram). For the purpose of determining the total amount used in the mixture, one bag

of cement shall be considered as weighing 0.94cwt (42.64 kg), and one barrel of cement shall be considered as weighing 3.76cwt (175.55 kg).

Timber will be measured by the thousand feet board measure (mfbm) (cubic meters) actually incorporated in the structure. Measurement will be based on nominal widths and thicknesses and the extreme length of each piece.

The term "lump sum" when used as an item of payment will mean complete payment for the work described in the Contract.

When a complete structure or structural unit (in effect, "lump sum" work) is specified as the unit of measurement, the unit will be construed to include all necessary fittings and accessories.

When standard manufactured items are specified such as fence, wire, plates, rolled shapes, pipe conduit, etc., and these items are identified by gage, unit weight, section dimensions, etc., such identification will be considered to be nominal weights or dimensions. Unless more stringently controlled by tolerances in cited specifications, manufacturing tolerances established by the industries involved will be accepted.

109.2-SCOPE OF PAYMENT:

The Contractor shall receive and accept compensation provided for in the Contract as full payment for furnishing all materials and for performing all work under the Contract in a complete and acceptable manner and for all risk, loss, damage, or expense of whatever character arising out of the nature of the work or the prosecution thereof, subject to the provisions of 107.20.

If the "Basis of Payment" clause in the Specifications relating to any unit price in the bid schedule requires that the unit price cover and be considered compensation for certain work or material essential to the item, this work or material will not also be measured or paid for under any other pay item which may appear elsewhere in the Specifications, except as provided in 104.6.

When the Contract specifies payment of an item or a portion of an item on a plan quantity basis, the quantities for payment will be those shown on the Plans with deductions from or additions to such quantities resulting from authorized deviations from the Plans.

If the Contractor believes that a quantity which is specified for payment on a plan quantity basis is incorrect, the Contractor may request the Division in writing to check the questionable quantity. The request shall be accompanied by calculations, drawing, or other evidence indicating why the plan quantity is believed to be in error. If the plan quantity is found to be in error, payment will be made in accordance with the corrected plan quantity.

The Division reserves the right to check the quantity of an item which is specified for payment on a plan quantity basis if there is reason to believe that it is inaccurate. If the quantity is found to be in error, payment will be made in accordance with the corrected plan quantity.

Should the Division determine during construction that conditions have varied from those anticipated in design to the extent that actual measurement of a plan quantity item is warranted, the Division will make such measurement, and payment will be based in lieu of the plan quantity.

109.2.1

109.2.1-General Basis of Adjusted Payment:

109.2.1.1-Single Deficiency: In the case of the single characteristic deficiency, the resulting deficiency shall be used directly to determine an adjusted price.

109.2.1.2-Multiple Deficiency: In the case of a multiple deficiency, the related adjusted percentage of contract price as determined by the acceptance plan for each characteristic shall be determined and the resulting percent of contract price to be paid shall be the product of these related adjusted percentages.

109.2.2-Basis of Charges for Additional Testing: When additional acceptance testing is performed by the Division for reworked lots or sublots in accordance with [106.3.1.2](#), the cost of such testing will be deducted on current estimates from the amount due the Contractor by the Division. The cost of such testing will be determined in accordance with the unit costs per test as shown in Table 9-1, published in MP 109.00.20.

109.3-COMPENSATION FOR ALTERED QUANTITIES:

When the accepted quantities of work vary from the quantities in the bid schedule, the Contractor shall accept as payment in full, so far as contract items are concerned, payment at the original contract unit price for the accepted quantities of work done. No allowance except as provided in [104.2](#) will be made for any increased expense, loss of expected reimbursement, or loss of anticipated profits suffered or claimed by the Contractor resulting either directly from such alterations or indirectly from unbalanced allocation among the contract items of overhead expense on the part of the bidder and subsequent loss of expected reimbursements therefore or from any other cause.

Increased work involving supplemental agreements will be paid for as stipulated in such agreements. The Contractor shall furnish substantiating data required in the preparation of these agreements.

109.4-FORCE ACCOUNT WORK:

If directed by the Division, as provided for in [104.3](#), the Contractor shall perform extra or unforeseen work on a force account basis and shall be compensated in the following manner:

109.4.1-Labor: For all labor and for foremen and superintendence in direct charge of the specific force account operations, the Contractor or subcontractor shall receive the actual current local rate of wage, agreed to in writing before beginning work, paid for each and every hour that the labor and foremen are actually engaged in the work.

The Contractor or subcontractor shall also receive the actual costs paid to, or in behalf of, workmen by reason of subsistence and travel allowances,

Worker's Compensation insurance premiums, unemployment insurance contributions, Social Security and Medicare taxes, health and welfare benefits, and pension fund benefits when such amounts are required by employment contract generally applicable to the classes of labor employed on the work. The Contractor or subcontractor shall furnish satisfactory evidence of the rate or rates and the amount paid for insurance premiums and taxes.

For overhead and profit, an amount equal to sixteen percent of the sum of the above labor costs shall also be paid to the Contractor or subcontractor.

109.4.2-Materials: For all materials used in the specific force account operation and incorporated into the project, the Contractor or subcontractor shall receive the actual cost of materials delivered including labor charges for employees of the material supplier who are required to perform an incidental amount of work in conjunction with the material furnished and freight charges paid exclusive of equipment rentals as hereinafter set forth. The Contractor or subcontractor shall furnish invoices to document actual materials costs; however, if materials used on the force account work are not specifically purchased for such work but are taken from the Contractor's or subcontractor's inventory, then in lieu of the invoices the Contractor or subcontractor shall furnish an affidavit certifying that such materials were taken from inventory, that the quantity claimed was actually used, and that the price and freight claimed represent the Contractor's or subcontractor's actual cost.

For overhead and profit, an amount equal to sixteen percent of the sum of the above materials costs shall also be paid to the Contractor or subcontractor. All materials paid for will become the property of the Division.

109.4.3-Equipment: The movement of equipment to and from the specified force account operation shall be as directed by the Engineer. All equipment must be in good operating condition to qualify for rental payment.

For all Contractor or subcontractor equipment either rented or owned, the rental rates and operating costs include full compensation for major repairs, repairs due to normal wear and tear, labor and parts needed for routine daily servicing of the equipment, operating expendables such as fuel, lubricants, tires and ground engaging components, and the percentage of mechanic's wages and related maintenance vehicles chargeable to preventive and field maintenance.

Payable time periods shall not include time elapsed before the Engineer has advised the Contractor or subcontractor that the equipment is required for use in the force account or time elapsed after the Engineer has advised the Contractor or subcontractor that the equipment is no longer needed exclusive of costs for transportation, assembly and disassembly set forth in [109.4.3.4](#), time elapsed while equipment is broken down or time spent repairing equipment. No separate payment will be made for any type of repairs to equipment.

When equipment is rented from a rental agency which the Contractor or subcontractor owns or is part owner, the equipment shall be treated as owned equipment and rental rates determined accordingly.

109.4.3

109.4.3.1-Rented Equipment: For required equipment which is not owned and must be obtained by rental, the Contractor or subcontractor shall be paid the actual rental cost for the equipment for the time that the equipment is required solely for use in the force account work. The Contractor or subcontractor shall furnish invoices to document actual equipment rental costs. Estimated operating costs shall also be paid for each hour the rented equipment is actually operated in the force account work, not to exceed the estimated operating cost per hour set forth for the equipment in the current Rental Rate Blue Book for Construction Equipment published by Dataquest, Inc.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for rented equipment shall also be paid to the Contractor or subcontractor.

109.4.3.2-Owned Equipment: For owned equipment, other than small tools costing less than \$500 each, the Contractor or subcontractor shall be paid a rental rate determined from the current Rental Rate Blue Book for Construction Equipment published by Dataquest, Inc. The hourly rate shall be determined by dividing the monthly rate set forth in the Rental Rate Blue Book by 176 with appropriate adjustments made for age and region. The hourly rate for overtime work shall be determined by dividing the monthly rate set forth in the Rental Rate Blue Book by 176 with appropriate adjustments made for age and region. The estimated operating cost per hour set forth in the Rental Rate Blue Book shall also be paid for each hour the equipment is actually operated in the force account work.

If the owned equipment is not referred to in the current Rental Rate Blue Book, the hourly rental rate will be an agreed amount not to exceed the hourly rate computed as follows: A monthly rental rate equivalent to six percent of the Contractor's or subcontractor's original acquisition cost of the equipment shall be established. The hourly rental rate shall then be determined by dividing this monthly rental rate by 176. Operating costs in such cases shall be a reasonable agreed-upon amount for each hour the equipment is actually operated in the force account work.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for owned equipment shall also be paid to the Contractor or subcontractor.

109.4.3.3-Idle Equipment: For required equipment held on the site of force account work on an idle basis at the request of the Engineer, the Contractor or subcontractor shall be paid for such idle time at an adjusted hourly rental rate exclusive of estimated operating costs. For owned equipment, such payment shall be made at one-half the hourly rate determined by dividing the monthly rate set forth in the Rental Rate Blue Book by 176 with appropriate adjustments made for age and region.

Payment of idle time for owned equipment on force account work shall not exceed 8 hours each day less the hours the equipment operates that day.

109.4.6

Payment for idle time shall not be made on Saturday, Sunday, holidays set forth in 101.42, when equipment is operated more than 8 hours per day or 40 hours per week, when equipment is idle due to the Contractor's or subcontractor's decision not to work on potential working days or when equipment is idle due to weather.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for idle owned equipment shall also be paid to the Contractor or subcontractor.

109.4.3.4-Miscellaneous: Transportation charges for owned or rented equipment to and from the site of the force account work shall be paid provided the equipment is obtained from the nearest approved source, the return charges do not exceed the delivery charges, haul rates do not exceed the established rates of licensed haulers, and charges are restricted to those units of equipment not already available and not on or near the project. In the case of owned equipment, the Contractor or subcontractor shall be paid idle time rates for the equipment being hauled in addition to the applicable rental rates for the hauling equipment. All costs associated with the assembly and disassembly of the equipment for transport shall also be paid. All charges by persons or firms other than the Contractor or subcontractor shall be supported by satisfactory invoices.

109.4.4-Taxes: When the work is done by the Contractor, the amount of State and municipal taxes related to the force account work required to be paid by the Contractor will be reimbursed to the Contractor. For work performed by a subcontractor, the amount of extra cost paid by both the Contractor and the subcontractor for corporate and business taxes levied by the State and municipalities due to the force account work shall be paid to the Contractor.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for State and municipal taxes shall also be paid to the Contractor or subcontractor.

For work performed by a subcontractor, the amount of extra cost incurred by the Contractor for increased business and corporate taxes shall be computed on the gross amount of the force account work, exclusive of the increased corporate and business taxes incurred by the subcontractor.

109.4.5-Contract Bond: The cost of premiums for contract bond required by 103.5 which is extra cost and related to the force account work will be paid to the Contractor.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for contract bond shall also be paid to the Contractor or subcontractor.

109.4.6-Insurance: The cost of premiums for Contractor's Public Liability and Property Damage Liability Insurance required by 103.6.1 and Contractor's Protective Public Liability and Property Damage Liability Insurance required by 103.6.2 which is extra cost and related to the force account work will be

109.4.7

paid to the Contractor.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for insurance shall also be paid to the Contractor or subcontractor.

When the force account work involves a railroad and the Contractor is required to carry Railroad's Protective Public Liability Insurance or Railroad's Protective Property Damage Liability Insurance, or both, the cost of premiums for this insurance which is extra cost and related to the force account work will be paid to the Contractor.

For overhead and profit, an amount equal to sixteen percent of the sum of the above costs for railroad insurance shall also be paid to the Contractor or subcontractor.

109.4.7-Administrative Allowance: For force account work performed by an approved subcontractor, the Contractor shall be paid an administrative allowance equal to sixteen percent of the total amount paid for all work performed by the subcontractor on the specific force account operation exclusive of additives paid for overhead and profit.

109.4.8-Records: The Contractor's representative and the Engineer shall compare records daily of the cost of work done as ordered on a force account basis, and shall indicate agreement by signature on such records.

No payment will be made for work performed on a force account basis until the Contractor has furnished the Engineer an itemized statement of the cost of such force account work detailed as follows:

- a. Name, classification, date, daily hours, total hours, wage rate, fringe benefit rate and extended amounts for each laborer and foreman.
- b. Quantities of materials, unit prices and extended amounts.
- c. Transportation of materials.
- d. Designation, dates, daily hours, total hours, rental rate/hour, operating cost/hour, and extended amount for each unit of equipment.
- e. Transportation of equipment.
- f. Rates for property damage insurance, liability insurance, bond, municipal tax, subsistence and travel allowance, Worker's Compensation insurance, unemployment insurance, Social Security and Medicare taxes.

The Contractor must also furnish satisfactory evidence of the actual cost for each of the charges listed on the itemized statement (excluding those charges for owned equipment determined from the Rental Rate Blue Book).

109.4.9-Basis of Payment: The compensation provided in 109.4.1 to 109.4.7, inclusive, shall be received by the Contractor as payment in full for extra work done on a force account basis, including all labor, materials, equipment, fuel, lubricants, maintenance of equipment, administration,

overhead, use of small tools and equipment for which no rental is allowed, profit, taxes, bond costs, insurance premiums, unemployment contributions and any other expense arising from the performance of the force account work.

109.5-ELIMINATED ITEM:

Should any items contained in the proposal be found unnecessary for the proper completion of the work, the Engineer may, upon written order to the Contractor, eliminate such items from the Contract, and such action will in no way invalidate the contract. When a Contractor is notified of the elimination of items, the Contractor will be reimbursed for actual work done and all costs incurred, including mobilization of materials prior to the notification.

109.6-PARTIAL PAYMENTS:

The Engineer will make current estimates in writing, once each month on or before the date set by the Engineer at the time of starting the work, or from time to time as the work progresses, of the materials complete in place and the amount of work performed in accordance with the Contract, during the preceding month or period and the value thereof figured at the unit prices contracted. Current estimates may be prepared for payment on a semi-monthly basis at the discretion of the Engineer when the amount due the Contractor for work during the semi-monthly period exceeds \$10,000. Should there be any doubt by the Engineer as to the integrity of any part of the completed work, the estimates for that portion will not be allowed until the cause for such doubt has been removed.

From the total of the amounts ascertained as payable, an amount equivalent to two percent of the whole will be deducted and retained by the Division until completion of the entire Contract in an acceptable manner. The balance, or an amount equivalent to 98 percent of the whole, less all previous payments, will be certified for payment.

When the work under contract has been completed and its acceptance is recommended by the Engineer, and upon written request by the Contractor accompanied by proper release by the Contractor's surety, a part of the two percent retained as outlined above, in an amount determined by the Engineer, may be released and paid the Contractor. A minimum of 2 percent of the approximate total final contract amount will be retained until payment of the final estimate.

Unless otherwise requested by the Contractor in writing, all amounts retained by the Division will be invested in the Consolidated Investment Fund of the State of West Virginia with interest accrued in the name of the Contractor. Dividends will be paid annually and a service fee as determined by the Fund will be deducted from the interest earned.

Substitution of Securities for Retainages:

- i. The Contractor may, from time to time, withdraw the whole or any portion of the amount retained for payments to the Contractor, under the Contract, with the written release from Contractor's surety,

109.7

- pursuant to the terms of the Contract, notwithstanding the provisions above, upon depositing with the State Treasurer, United States treasury bonds, United States treasury notes, United States treasury certificates of indebtedness or United States treasury bills, or bonds or notes of the State of West Virginia. A safe keeping receipt from a bank located in the State of West Virginia may be deposited with the State Treasurer in lieu of any of the definitive securities. No amount shall be withdrawn in excess of the market value of the securities at the time of deposit or of the par value of the securities, whichever is lower.
- ii. The State Treasurer shall on a regular basis, collect all interest or income on the obligations so deposited and shall pay the same, when and as collected, to the Contractor who deposited the obligations. If the deposit is in the form of coupon bonds, the State Treasurer shall deliver each coupon as it matures to the Contractor.
 - iii. Any amount deducted by the State, or by any public department or official thereof, pursuant to the terms of the Contract, from the retainages due the Contractor, shall be deducted, first from that portion of the retainages for which no security has been substituted then from the proceeds of any deposited security. In the latter case, the Contractor shall be entitled to receive interest, coupons or income only from those securities which remain after such amount has been deducted.
 - iv. Any Contractor who has substituted a security or securities for retainages and the same matures before the completion and finaling of the Contract for which the security or securities were substituted for retainages may, from time to time, substitute another security or securities for the one or ones having so matured in the same manner that the original security or securities were substituted so long as the substituted security or securities are of a kind designated in (i) above, of equal value to the matured security or securities for which it is substituted. All interest and income accruing on such substituted security or securities shall be collected and paid and the security or securities themselves shall be held, handled and delivered by the State Treasurer in the same manner, as is provided in (ii) and (iii) above, for the original security or securities deposited.

109.7-PAYMENT FOR MATERIAL ON HAND:

Partial payment may be made to the extent of the delivered costs of material to be incorporated into the work, provided the material meets the requirements of the Plans and Specifications when delivered in the vicinity of the project or at approved off-site locations. In any event, partial payment for material on hand will not exceed the bid price. Such material shall be stored in acceptable storage places, and the Contractor shall furnish evidence of payment for the delivered cost of the material within 90 days of the cut-off date of the estimate on which this material was paid.

109.8-ACCEPTANCE AND FINAL PAYMENT:

When the project has been accepted, as provided in 105.16, the Engineer will prepare the final estimate of the quantities of the various classes of work performed. Before the final payment is made, the Contractor shall execute the Statement of Acceptance on the back of the final estimate. After the Contractor executes such final estimate or if the Contractor fails or declines to execute the final estimate within 30 days after receipt, the Division will consider the estimate approved and accepted and he will be paid the entire sum found to be due after deducting all previous payments and all amounts to be retained or deducted under the provisions of the Contract. Upon written request from the Contractor received within 30 days of his receipt of the final estimate, the time for review and execution of the final estimate will be extended up to 60 additional calendar days. Should the Contractor desire to reserve the right to file a claim with the State Court of Claims for any sum or compensation not included in the final estimate, growing out of the Contract, then a Reservation of Right stipulating the nature, each item and the amount claimed shall be added at the end of the acceptance statement. This claim must be filed with the State Court of Claims within 120 days of execution of the final estimate. The acceptance of final payment of the contractor shall be considered a release in full of all claims against the West Virginia Division of Highways, State of West Virginia arising out of said project, except for any claim reserved at the end of the acceptance statement on the back of the final estimate.

All prior partial estimates and payments will be subject to correction in the final estimate and payment.

109.9-PRICE ADJUSTMENT OF FUELS:

Because of the uncertainty in estimating the costs of fuels that will be used during the life of this contract, adjustment in certain contract items is provided for as follows:

Product price quotations for Bulk Gasoline, unleaded (octane rating 87), and for Fuel Oil No. 2 (diesel fuel), as published in Platt's Oilgram Price Report will be utilized to establish the contract base price as well as the monthly base price thereafter. These prices will be the average of the individual prices for the following locations:

Baltimore, Maryland
Norfolk, Virginia
Greensboro, North Carolina
Pittsburgh, Pennsylvania
Columbus, Ohio

As published for the first Monday of the month.

If the first Monday of the month falls on a holiday or the prices are otherwise not published for that date, the Index (Ip) will be based on prices in the next edition of Platt's Oilgram in which these prices are listed.

Base prices applicable to this contract are contained in the contract

109.9

documents under NOTICE TO BIDDERS entitled Base Prices For Fuels and Items to be Adjusted for Price of Fuels.

Each month the Engineer will be furnished with the current monthly base prices (Mbp) for gasoline and diesel fuel. When the ratio of the monthly base price (Mbp) divided by the contract base price (Cbp) is less than 0.950 or greater than 1.050, adjustment for fuel will be made in accordance with the following formula:

$$Pa = [(Mbp \div Cbp) - 1.00] \times Cbp \times Q$$

where:

Pa = Price Adjustment

Mbp = Monthly Base Price

Cbp = Contract Base Price

Q = Gallons (Liters) of fuel used in items of work performed during the estimate period, calculated in accordance with this Special Provision.

Adjustments in compensation for any period may be either plus or minus. If Mbp is greater than Cbp, the adjustment will be plus. If Cbp is greater than Mbp, the adjustment will be minus.

The adjustments in compensation for petroleum fuels used for the listed items will be made on the separate items on the basis of the average fuel requirements for processing a unit of the item as shown in the following table:

COST ADJUSTMENT FACTORS FOR FUEL USAGE

Class		Units	Diesel	Gasoline
1	Unclassified Excavation: Borrow Excavation	Gallons per cubic yard (Liters per cubic meter)	0.39 (1.94)	0.18 (0.89)
2	Aggregates	Gallons per ton** (Liters per megagram)	0.62 (2.59)	0.4 (1.68)
3	Bituminous Concrete	Gallons per ton** (Liters per megagram)	1.06 (4.43)	0 (0)
4	Portland Cement Concrete Pavement	Gallons per cubic yard (Liters per cubic meter)	0.76 (3.77)	0.23 (1.14)

**Where the pay item for aggregate is in cubic yards (meters), conversion to tons (megagrams) for the purpose of fuel price adjustment will be made on the basis that one cubic yard (meter) equals 1.75 tons (2.08 megagrams).

Fuel requirements for the items listed above include the total of both diesel and gasoline.

The gallons (Liters) of fuel for price adjustment (Q) will be determined by multiplying the factors listed above by the amount of acceptable work performed on the separate items during an estimate period.

Any difference between the checked final quantity and the sum of quantities

shown on the monthly estimates for any item will be adjusted by the following formula:

$$FA = (FCQ \div PRQ) \times EA$$

where:

FA	=	Final Adjustment (dollars)
FCQ	=	Final Checked Quantity
PRQ	=	Total Quantity Previously Reported on Monthly Estimates
EA	=	Total Adjustment Shown on Monthly Estimates (dollars)

All adjustments will be made based on the gallons (Liters) of fuel indicated in the above table and no changes will be made for variations between these usage factors and the actual factors.

The monthly base price for determining price adjustments for all work performed after the contract completion date, as revised by approved time extensions, will be the monthly base price (Mbp) at the time of the contract completion date (as extended) or at the time the work was performed, whichever is less.

The final adjustment will consider any error(s) that may have been made in the computation of monthly adjustments

109.10 - PRICE ADJUSTMENT OF ASPHALT CEMENT:

Due to the uncertainty in estimating the costs of petroleum products that will be used during the life of this contract, adjustment in compensation for certain contract items is provided for as follows.

The contract items listed in the Proposal in the Table of Materials to be Adjusted for Price at the Time of Placement will be adjusted in accordance with the Division's index for asphalt cement. This index will be the average of the posted prices of asphalt cement per megagram as reported from the following sources:

Marathon Ashland Petroleum, LLC, Ashland, Kentucky
 Asphalt Materials, Marietta, Ohio
 Marathon Ashland Petroleum, LLC, Floreffe, Pennsylvania
 Citgo Asphalt Refining Co., Baltimore, Maryland
 Shell Oil Company, Bristol, Virginia

The bidding index (I_b) as determined above is published elsewhere in the proposal. The price adjustment for the specified material at the time of placement will be based on an index price determined by averaging the posted prices reported by the six (6) sources listed above for the first working day of the month in which the work is performed.

If one of the sources listed above changes ownership and/or name the posted price from that terminal will continue in use as though the ownership and/or name change had not occurred.

109.11

If one of the sources used for determining the index goes out of business the index in the proposal I_b and the index at the time of placement I_p will be based on the average of the remaining sources. Thus, I_b could be based on an average of 6 sources and the I_p on the average of 5 sources or vice versa. If a source that goes out of business reopens at a later date the index determined will once again be based on 6 sources as per the previous paragraph.

The posted price for each source will be compared to the average of all sources. If the difference between the average and the individual price is greater than 25 % of the average, that individual source will be excluded from the calculation of the average price I_b or I_p and a new average will be calculated using the remaining sources.

When the ratio of the price index at placement (I_p) divided by the price index at bidding (I_b) is less than 0.90 or greater than 1.10, the portion of the contract unit price which reflects the cost of the specified material will be adjusted for the change in accordance with the following formula.

$$Pa = [(I_p + I_b) - 1.00] \times Q \times \text{Applicable "C" Factor (C, C}_1 \text{ or C}_2)$$

where:

Pa	=	Price Adjustment
I_p	=	Price Index at Time of Placement
I_b	=	Price Index for Bidding
C, C ₁ , C ₂	=	Adjustable Material Cost per Unit of Contract Item Bid
Q	=	"As Constructed" Quantity

The price index for determining price adjustments for all work performed after the contract completion date, as revised by approved time extensions, will be determined as follows: The price index (I_p) shall be for the month in which the contract completion date (as extended) falls, or the price index for the month in which the work was performed, whichever is less.

109.11 THROUGH 109.19-BLANK

109.20-PRICE ADJUSTMENT FOR LOAD LIMIT VIOLATIONS:

The Allowable Gross Weight for any vehicle being used to haul materials on publicly maintained highways under the terms of this contract shall be as follows unless otherwise vested by law.

Vehicle Type	Allowable Gross Weight
Two - Axle Truck	34,000 LBS (15.42 Mg)
Three - Axle Truck (Tandem Axle In Rear)	54,000 LBS (24.49 Mg)
Four - Axle Truck (Tri - Axle in Rear)	63,000 LBS (28.58 Mg)
Five - Axle Truck (Quad - Axle in Rear)	70,000 LBS (31.74 Mg)
Five or More Axles (Combination Vehicle)	80,000 LBS (36.29 Mg)

The Allowable Gross Weight shown above is the maximum gross weight that the majority of vehicles of that type can legally haul. Any vehicle that can legally have a gross weight different from that specified above may be inspected by the Division of Highways, Weight Enforcement Section and receive a certificate showing the maximum legal gross weight for that vehicle which shall be used in lieu of the Allowable Gross Weight from this provision.

All materials from a commercial source or a batch plant are subject to a price adjustment for load limit violations. The Division of Highways is not enforcing the West Virginia Motor Vehicle Laws with this provision, however, it is enforcing a contractual requirement that makes reference only to the provisions that are described. Nothing in this provision relieves any party from compliance with the State Law on load limits or any fines which may be assessed for violation of said law.

Material moved by the Division of Highways Special Permit for excess size or weight pursuant to West Virginia Code 17C-17-11 is exempt from this provision.

A weigh ticket shall be required with each load of material from a commercial source which would normally have truck scales. This includes, but is not limited to, all asphalt paving materials and all aggregates regardless of the contract pay unit. The weigh ticket shall include gross, tare, and net weights, time and date of loading, Item Number or Description of Materials, Contract Number or Project Number, number of axles on haul unit, license number of haul unit, and signature of the weigher certifying that all information on the ticket is correct. The weigh ticket shall be used to determine the Allowable Gross Weight and the Actual Gross Weight for each load of material delivered by that haul unit.

For material from a commercial source or a batch plant, which would not normally have truck scales, a weigh ticket documenting the tare weight, number of axles on the haul unit, license number of haul unit, date weighed, location of scales, and signature of the weigher certifying that all information on the ticket

109.20

is correct, may be supplied for each haul unit as an alternate to the ticket required in the pervious paragraph. The tare weight ticket shall be supplied for each contract on a yearly basis and when modifications are made to the vehicle or combination of vehicles. In this situation the Allowable Gross Weight shall be determined from the weight ticket information. The Actual Gross Weight shall be determined by adding the tare weight of the haul unit to the weight of the material delivered. The weight of the material delivered shall be calculated and furnished by the vendor/supplier shipping the material to the project site or DOH facility. This includes, but is not limited to, concrete, structural steel, piling, reinforcing steel and all prepackaged material of known weight, such as cement, grout, fertilizer, lime, abrasives, etc.

If the haul unit is a combination of vehicles, the license number shall be supplied for each component. The tare weight shall be for the complete haul unit.

All weighing shall be done on scales approved and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures. If the scales are moved or upon the request of the Engineer, the scales shall bereapproved and sealed. The Engineer shall be notified of any scale malfunctions. The Division of Highways may, at its option, accept inspection and sealing by out of state agencies when the material is being loaded outside West Virginia.

A price reduction shall be assessed for each load of material where the actual gross weight exceeds the allowable gross weight. The amount of the price reduction shall be twenty-five Dollars (\$25.00) per ton for each ton(twenty-eight Dollars (\$28.00) per megagram for each megagram), or portion thereof, in excess of the allowable gross weight except that no reduction shall be assessed if the amount in excess of the allowable gross weight is less than 500 lbs (225 kg). This amount shall be deducted as a price adjustment for load limit violations.

Any material, covered by this provision, which is delivered without the proper weigh ticket shall not be accepted by the Division of Highways.

SECTION 110 MISCELLANEOUS PROVISIONS

110.1-COMMON CARRIER RATES:

The common carrier rates and taxes which are current on the date of opening the bids shall be considered as applicable to all items subject to transportation charges thereunder.

If such rates or taxes are thereafter increased by public authority on any materials entering into and forming a part of the Contract, an amount equal to the sum of all such increases, when evidenced by receipted common carrier bills, will be paid to the Contractor by the Division. All claims for such payments shall be made within 60 days after final acceptance of the work.

If such rates or taxes are thereafter reduced by public authority on any materials entering into and forming a part of the Contract, an amount equal to the sum of all such decreases, when evidenced by receipted common carrier bills, will be deducted by the Division from the monies due the Contractor on the work performed under the Contract.

When deliveries of materials are performed by means other than common carriers, an increase or decrease in price will not be allowed or charged for changes in rates or methods of delivery.

110.2-MINIMUM WAGE DETERMINATIONS:

When the Proposal contains both U.S. Department of Labor and West Virginia Division of Labor Wage Rates, the minimum wage rates for the Contract shall be the higher of the rates for each job classification.

110.3-NONDISCRIMINATION OF EMPLOYEES (GOVERNOR'S EXECUTIVE ORDER):

During the performance of this Contract for public work or for goods or services, the Contractor agrees as follows:

The Contractor and subcontractors shall provide equal employment opportunity for all qualified persons and shall not discriminate against any employee or applicant for employment because of race, creed, color, or national origin.

Contractors and subcontractors are required to give written notice to any labor union with which they have a collective bargaining or other agreement, that they have complied with the requirements of the Executive Orders by the Governor of the State of West Virginia, dated October 16, 1963, and December 15, 1965. These provisions shall be fully and effectively enforced and any breach of them will be regarded as a material breach of the Contract.

110.4-PROVISIONS FOR WEST VIRGINIA STATE FUNDS CONTRACTS:

110.4.1

110.4.1-Applications: These contract provisions shall apply to all work performed on the Contract by the Contractor with their own organization and with the assistance of employees under their immediate superintendence and to all work performed on the Contract by piece work, station work, or by subcontract.

110.4.2-Employment Lists, Labor Selection: A local public employment agency will be designated by the State to prepare the employment lists for the project. At, or prior to contract award, the Contractor will be advised of the exact designation and location of the agency selected for this purpose, and the name and location of such agency will be inserted in the Contract.

All qualified unskilled labor shall be employed as far as possible from lists furnished to the Contractor by the employment agency designated in the Contract. The Contractor may avail themselves of the services of the employment agency for obtaining labor of the intermediate and skilled grade.

In the performance of this Contract, the Contractor shall not discriminate against any worker because of race, creed, color, or national origin.

110.4.3-Payrolls: Submission by the Contractor, or subcontractor, of payrolls, or copies thereof, is not required. Each Contractor, or subcontractor, shall preserve their weekly payroll records for a period of three years from the date of completion of this Contract. The payroll records shall set out accurately and completely the project number, name, classification, hourly wage rate of each employee, hours worked by each employee daily and weekly wages earned by each employee, and deductions made from such weekly wages, and the actual weekly wages paid to each employee. Such payroll records shall be made available at all times for inspection by authorized representatives of the Division.

110.4.4-Payment of Predetermined Minimum Wages: These contract provisions are supplemented elsewhere in the Contract by Special Provisions which set forth the certain predetermined minimum wage rates. The Contractor shall pay not less than these rates.

The wages of all labor shall be paid in legal tender of the United States, except that this condition will be considered satisfied if payment is made by negotiable check, on a solvent bank, which may be readily cashed by the employee in the local community for the full amount, without discount or collection charges of any kind. Where checks are used for payment, the Contractor shall make all necessary arrangements for the checks to be cashed and shall give information regarding such arrangements.

The minimum wages specified shall be exclusive of any charges for medical examination, medical fees, or insurance, except as specifically required by State Law. No individual employed on the project in other than an administrative position shall be paid less than the minimum rate for unskilled labor.

DIVISION 200 EARTHWORK

SECTION 201 CLEARING AND GRUBBING

201.1-DESCRIPTION:

This work shall consist of clearing, grubbing, removing, and disposing of all vegetation and debris within the construction limits and in other areas within the right-of-way or easement limits, as set forth in the Contract or as designated by the Engineer, including selective clearing of areas; site grading of public and private roadways, lanes, vehicular paths or any other existing man made improvements which lie between the construction and right-of-way limits; except such objects as are designated to remain or to be removed in accordance with other sections of these Specifications. This work shall also include preservation from injury or defacement of all vegetation and objects to remain.

201.2-MATERIALS:

Asphaltum base paint for tree surgery shall conform to the requirements of [715.36](#).

CONSTRUCTION METHODS

201.3-GENERAL:

The Engineer will designate the trees, shrubs, plants and other items to be removed or to remain. All items designated to remain shall be preserved by the Contractor. Alignment stakes, grade stakes, guard stakes, boundary markers, bench marks and tie points shall be preserved until such time as their usefulness has ceased and permission for their destruction is given by the Engineer.

201.4-CLEARING:

Areas indicated on the Plans, and borrow and waste sites furnished by the Division, shall be cleared of the obstructions described. In areas where the proposed embankment is to be 5 ft. (1.5 meters) or more in depth, measured below the subgrade, all stumps shall be cut off as close to the ground as is practicable but not to exceed 6 inches (150 mm) above the ground surface at the base of the stumps. When stumps are located in the area of the backslope rounding of cut sections, they are to be cut flush with or below the final slope line. Areas where the proposed embankment is to be less than 5 ft. (1.5 meters) shall be treated as prescribed in [201.6](#).

All merchantable timber and wood in the clearing area, except trees designated to remain, which has not been removed from the right-of-way prior to the date of advertising for bids shall become the property of the Contractor, unless otherwise provided.

201.5

Unsound or unsightly branches of trees and shrubs which are designated to remain, and are not specified to be removed under another item, shall be removed as directed. Branches of trees extending over the area occupied by the roadbed shall be trimmed to give a clear height of 20 ft. (6 meters) above the road and shoulder pavement surface. All trimming shall be done by skilled workers and in accordance with good tree surgery practices.

In all areas where stumps and shrubs are to remain, the surface of the ground shall not be unduly disturbed or compacted. Existing ground cover shall be preserved insofar as possible, and the area shall be left neat and clear and in a condition which is reasonably consistent with the surroundings.

All abandoned utility poles within the limits of the right-of-way shall be removed and disposed of by the Contractor. The removal shall be treated in a similar manner as the clearing and grubbing of trees. The poles to be abandoned will be marked by the Project Engineer.

201.5-SELECTIVE CLEARING AND THINNING:

In order that the trees may be properly marked in advance of thinning operations, the Contractor shall give the Engineer at least two weeks notice prior to starting work or prior to resuming work after suspending operations. Trees or bushes not designated to remain shall be cut. In no event shall selective clearing and thinning operations begin until the Engineer has given approval.

All dead or diseased trees or shrubs, junk, trash, litter, or foreign matter of any kind shall be removed from the areas to be treated. This shall include uprooted stumps and all branches, tops, trunks, and dead wood resulting from woodcutting operations or from any other causes.

Trees and shrubs to be preserved shall be carefully pruned to remove all dead wood and diseased or injured tops or branches. In addition, in certain areas the Engineer may require the branches of designated trees to be removed to a height of 20 ft. (6 meters) above ground as directed in order to improve sight distance, provide head clearance, open vistas, or improve appearance of the tree. Complete clearing may be required in certain areas for the purpose of removing shade hazards, improving sight distances, or improving appearance. Such clearing shall be included under this Section.

The Contractor shall avoid disturbing or compacting the existing ground surface, as well as avoid damage to plant growth. The use of tractors, cranes, winches, or any other heavy equipment, operating anywhere within the area to be selectively thinned, will not be allowed unless exceptions are specifically authorized.

Any injury to trees and shrubs which are to be preserved shall be carefully repaired. Disturbed ground surface shall be restored as nearly as possible to natural condition.

All pruning and repair to live trees and shrubs shall be done by skilled workers according to approved arboricultural practice. All pruning scars and all cuts and wounds 1 in. (25 mm) in diameter or over shall be painted with an asphaltum base paint. The Engineer may permit such cuts on evergreen trees to

remain unpainted. All stumps, new or old, shall be cut to a maximum height of 6 inches (150 mm) above the surrounding ground or as directed by the Engineer. Undesirable trees leaning or falling over the highway right-of-way from outside shall be cut at the property line.

201.6-GRUBBING:

In areas where embankments are to be constructed less than 5 ft. (1.5 meters) in depth, measured below the subgrade, complete grubbing of all trees, stumps, roots, bushes or hedge fences shall be accomplished.

In areas where embankments are to be constructed 5 ft. (1.5 meters) or more in depth, measured below the subgrade, stumps which have not been loosened by clearing and grubbing operations, and nonperishable solid objects, need not be grubbed or removed provided they are cut off so as not to protrude more than 6 inches (150 mm) above the original ground surface. Near the toe of embankment slopes no stump shall extend above a point 1 ft. (300 mm) beneath the embankment slope surface.

In areas not included within construction limits or selective clearing areas, all stumps shall either be grubbed or cut flush with or below the original ground line. Brush, shrubs, down timber, rotten wood, rubbish and other objectionable objects and vegetation shall be cleared flush with the ground. Such areas will be clearly indicated on the Plans.

201.7-DISPOSAL:

All wood, trash, debris, stumps, and other foreign matter shall be removed and disposed of by the Contractor. Material may be disposed of at approved waste areas or in accordance with the provisions prescribed. Non-combustible material may be disposed of in embankments in accordance with the applicable provisions.

In urban areas, open burning of construction wastes, demolition wastes, and vegetation will not be permitted. However, if the Engineer determines that no other practical means of disposal exists, open burning of selected vegetation, such as trunks, limbs, etc., approximately 4 inches (100 mm) diameter or less, will be permitted. Vegetation must also be dry and stacked in such a manner as to promote combustion. Incinerations, including air curtain burners, may be used provided they are approved by the West Virginia Air Pollution Control Commission. In rural areas, open burning will be permitted under controlled conditions to minimize the amount of smoke. All burning must take place after sunup and all fires must be extinguished by sundown. It is the intent of this Specification that the health, safety, comfort, and the property of persons in the vicinity are protected from the effects of such burning. All burning shall be done in accordance with the applicable laws, ordinances, and regulations, and it shall be further subject to the applicable provisions of West Virginia Administrative Regulation, Air Pollution Control Commission, Chapters 16-20, Series VI.

No burning shall be done except under carefully controlled conditions. When material is burned, extreme care shall be taken with fires. Burning shall

201.8

be done under the care of competent watchmen and in such manner that the surrounding vegetation, objects designated to remain on the right-of-way, or adjacent property shall not be jeopardized or damaged.

At the option of the Contractor, combustible material may be reduced to chips of a maximum size of ½ inch (15 mm). The chips may be disposed of in areas where erosion control is required, as a substitute for straw mulch in accordance with the Applicable provisions of 642 and 652, or between slope lines and right-of-way lines as determined by the Engineer.

The Contractor will be held responsible for any damage caused by fires. The Contractor shall remove and dispose of burned material; replace trees, shrubs, fences or other objects designated or described to remain, but which have been damaged; and seed burned areas; all in an acceptable manner. Upon completion of the work, nothing shall remain within the right-of-way limits, nor along the land adjacent thereto, which was designated for removal in this Specification, which was deposited by the Contractor as the result of any of the operations of construction, which is a nuisance, of any unsightly nature, or in any manner obstructing natural drainage.

Concrete, stone, brick, and other masonry materials which have been broken into pieces not exceeding 2 ft. (600 mm) in any dimension may be permitted in embankments but not within 2 ft. (600 mm) of the subgrade 1 ½ ft. (450 mm) of the top of the side slopes. Material such as wood, steel, and broken concrete matted together by steel reinforcement will not be permitted in any portion of the embankment. All voids shall be completely filled with suitable material and compacted to the density specified in 207.

The disposal of Construction/Demolition Waste Materials shall be in accordance with Section 207.6.5.

201.8-METHOD OF MEASUREMENT:

The quantity of work done, will be on a lump sum basis.

Clearing and grubbing for waste sites or borrow pits furnished by the Contractor shall be included in the bid price for Item 207001-*, "Unclassified Excavation"; Item 211001-*, "Unclassified Borrow Excavation"; Item 211002-*, "Rock Borrow Excavation"; or Item 211003-*, "Select Borrow Excavation".

The removal of trees outside of clearing and grubbing and selective clearing areas designated on the Plans shall be accomplished under the provisions of 109.4.

201.9-BASIS OF PAYMENT:

The quantities, determined as provided above, shall be paid for at the contract price bid for the item listed below, which price and payment shall be full compensation for doing all the work prescribed in a workmanlike and acceptable manner, including all labor, materials, tools, equipment, supplies, and incidentals necessary to complete the work. The lump sum bid price will be full compensation for the estimated quantities shown in the Plans. Any increase or decrease from estimated quantities will be adjusted for total compensation on a prorate basis consistent with areas that have been added or

deleted.

All salvable material including merchantable timber shall become the property of the Contractor unless otherwise indicated on the Plans or in the Proposal, and any salvage expected shall be computed as a credit before arriving at the bid price for this item.

201.10-PAY ITEM:

ITEM	DESCRIPTION	UNIT
201001-*	CLEARING AND GRUBBING	LUMP SUM

* Sequence number

SECTION 202 BUILDING DEMOLITION

202.1-DESCRIPTION:

This work shall consist of complete demolition of such buildings and appurtenances as are specifically designated on the Plans for removal. It shall include rodent control when specified in the Contract, and disconnecting utilities, salvaging and disposing of the resulting materials in the manner and subject to the conditions and regulations prescribed.

202.2-MATERIALS:

The rodenticide treated bait shall consist of the following:

Type I Bait-An anticoagulant, 0.5 percent concentrate, such as warfarin, pival, fumarin, PMP, etc., mixed with cereals and other rodent attractants in the following proportions by weight:

One part anticoagulant to seven parts coarse yellow corn meal; five parts rolled oats; one part granulated sugar; one part corn oil.

In the event rodents do not accept this formula chopped fruit may be substituted for the rolled oats in the same proportion.

Type II Bait-Zinc phosphide, 100 percent concentrate (94 percent minimum assay), mixed in the proportion of 1:96 (one ounce to six pounds) of ground meat or canned dog food.

All rodenticides shall be handled and mixed in the bait in accordance with the manufacturers' instructions.

Insecticide-Two percent Diazinon Dust, or five percent Malathion Dust, or 10 percent Carbaryl Dust, or two to five percent Chlordane Dust.

CONSTRUCTION METHODS

202.3-UTILITIES:

The Contractor shall be solely responsible for making all necessary arrangements and for performing any necessary work to the satisfaction of the utility companies and municipal departments involved in connection with the discontinuance or interruption of all public utilities or services, such as gas,

202.4

water, sewage, electricity, and telephone, which may be affected by the work to be done under the demolition specified.

202.4-DEMOLITION AND EXTENT OF REMOVAL:

The demolition shall conform to the schedule of construction set up for the project.

Buildings and appurtenances shall be removed to the existing ground level, which operation shall include removal of concrete slabs or any other type of floor resting upon the ground. Basements shall be cleared of all debris, appliances, wood or metal partition walls, wood floors, etc., so that only the foundation walls and basement floor remain. The basement floors shall be shattered. If pits, trenches, holes, or basements are not to be eliminated in subsequent excavation operation, they shall be backfilled. All backfill within the roadway prism shall be accomplished in accordance with the requirements of 207. Compaction of backfill outside the roadway prism shall be performed so as to obtain a minimum density equal to that of the surrounding ground.

202.5-DISPOSAL OF MATERIALS:

Materials resulting from demolition shall be disposed of by the Contractor at a West Virginia Division of Natural Resources approved landfill.

202.6-RAT CONTROL:

When specified in the Contract, the following rat control provisions shall apply.

202.6.1-General: The Contractor shall furnish and place suitably prepared bait containing rodenticide in and around buildings to be demolished and shall also furnish and place insecticide for control of ectoparasites. Two rodenticide treated baits differing in content and method of placement will be required within 24 hours after receipt of notification to proceed. The Contractor shall place rodenticide treated bait within the building demolition area.

If the rodent control measures are not promptly furnished by the Contractor, the Division may provide the measures as required and deduct the cost from the money due the Contractor.

202.6.2-Insurance Requirements: In addition to the insurance required of the Contractor on all Division Contracts, the Contractor is required to maintain Liability Insurance for this work in the amounts and form as set forth below for the duration of the work:

- | | | | |
|------|--------------------|-------|-----------------|
| i. | Public Liability | _____ | \$ 1,000,000.00 |
| ii. | Products Liability | _____ | \$ 1,000,000.00 |
| iii. | Owner Liability | _____ | \$ 1,000,000.00 |

The above insurance shall be purchased by the Contractor on behalf of the Division from a company authorized to do business in the State of West Virginia.

202.6.3-Rodent Control Operations: Type I bait containing anticoagulant

shall be placed in shallow bait containers fastened to the floor surface of buildings or in shallow containers heavy enough to prevent overturning or removal to burrows. The containers shall be protected from domestic animals and weather and shall be distinctly labeled with the word Poison and symbol thereof. The initial rate of application shall not be less than four pounds of bait per 1,000 sq. ft. (2 kg per 100 square meters) of building area.

Type II bait containing zinc phosphide shall be wrapped in paper squares approximately 4 in. by 4 in. (100 by 100 mm) in size to form baits about the size of a candy "Kiss". Bait should be placed out of reach of children or pets and should be tossed in otherwise inaccessible places. Initial rate of application shall be a minimum of 20 baits per residential building and 40 baits per commercial building.

Bait shall be placed near burrows, runways, or other areas showing rodent signs. A shallow pan containing water shall be placed in each building.

At the time the bait is set out, the Contractor shall treat all runways, burrow entrances, nests and vertical surfaces against which the rodents may brush with the insecticide dust at a rate of 2 ½ pounds (1 kg) per residential building and four pounds (2 kg) per commercial building.

Location of all bait, bait containers and water containers shall be noted and bi-weekly inspection and replacement of bait and water shall be made. In the event bait is not touched for several days, the bait shall be moved to other areas in the building. Mouldy, wet, caked or insect infested bait shall be replaced. Insecticide dusting shall be repeated once per month.

Baiting and insecticide dusting shall continue until all buildings and rubble are removed from the building demolition area.

A sign shall be posted at the front and rear of each building treated for rodent control. The sign shall be a minimum size of 30 in. by 30 in. (750 by 750 mm) with red lettering and poison symbols on a contrasting background.

Wording of the sign shall be as follows:

**THIS BUILDING
TREATED
FOR RODENT CONTROL
POISON
NO ADMITTANCE**

Minimum size lettering of the word POISON and symbols thereof shall be 6 inches (150mm). All other lettering shall be a minimum of 4 inches (100 mm). The sign shall be made of weather resistant materials such as plastic or exterior plywood and shall be securely fastened to the building.

Where buildings to be demolished have had exterior poison warning signs placed upon them during the Division phase of the rodent control program, the signs remaining on the buildings to be demolished will serve as adequate warning and the signing requirement of this Section is waived.

Exterior poison warning signs previously placed by the Division shall, upon demolition of the buildings, remain Division property and shall be stored on the project for removal by the Division.

Dead rodents shall be removed from the building demolition area daily and

202.7

shall be buried at a minimum depth of 2 ft. (600 mm). The disposal area shall be provided by the Contractor and shall be subject to approval by the Engineer.

202.7-WATER WELLS:

A water well that serves a building that is being demolished shall be abandoned as follows:

Water Wells that are abandoned shall be capped by removing the pump and piping and filling the upper 10 ft. (3 meters) of casing (flush with the end of the casing) with concrete to prevent aquifer contamination.

The Contractor shall obtain a permit to abandon a water well from the County Sanitarian and follow all procedures prescribed in the permit.

202.8-SEPTIC TANKS:

A septic tank that serves a building that is being demolished shall be abandoned as follows:

The contents of the septic tank shall be removed by a licensed septic tank cleaner and the tank removed and disposed of at an approved landfill. The excavation made to remove the tank shall be backfilled with material free of sod, trash, organic substances and muck. The backfill shall be compacted as outlined in 202.4.

202.9-METHOD OF MEASUREMENT:

The unit of measurement will be lump sum value as determined for each building to be demolished and removed, each water well abandonment or each septic tank abandonment.

202.10-BASIS OF PAYMENT:

The buildings demolished and removed as provided above will be paid for at the contract unit price per building, which price and payment shall constitute full compensation for performing all of the requirements of this item, including furnishing all material, labor, tools, equipment, supplies, and incidentals thereto. Salvageable materials resulting from the demolition shall become the property of the Contractor, unless otherwise indicated on the Plans or in the Proposal, and any salvage expected shall be computed as a credit before arriving at a bid price.

The cost of furnishing, placing and maintaining rodenticide treated bait and water, the cost of furnishing and placing insecticide, the cost of signing and disposal of dead rodents, including all material, labor and equipment shall be included in the unit price bid for "Building Demolition".

The water wells or septic tanks abandoned as provided above will be paid for at the contract price per water well or septic tank which price and payment shall constitute full compensation for performing all of the requirements of this item, including furnishing all material, labor, tools, equipment, supplies, and

incidentals thereto.

SECTION 203 DISMANTLING STRUCTURES

203.1-DESCRIPTION:

This work shall consist of dismantling such structure or structures specifically designated on the Plans for removal, and matchmarking handling and storage if called for, or disposal if required.

The Contractor is responsible for determining the current condition of the structure (s) and shall use methods and procedures for dismantling the structures in a safe and efficient manner.

Bridge inspection reports are available for informational purposes and may be viewed at the following location:

West Virginia Division of Highways
1900 Kanawha Boulevard East
Building 5, Room A-350,
Highway Operations Division
Charleston, West Virginia 25305-0430

The work shall also include the preparation of a demolition/dismantling plan by the contractor. The plan shall be prepared and sealed by a Professional Engineer registered in the State of West Virginia, experienced in structural analysis of bridges.

The plan shall include a complete structural analysis for all phases of the demolition/dismantling with due regard to the existing condition of the structure at the time the work is performed. Additionally, the analysis shall show that the structure meets the design criteria of the latest edition, including all Interims, of the *AASHTO Standard Specifications for Highway Bridges*, or the *AASHTO LRFD Bridge Design Specifications* during all phases of demolition/dismantling. The design loads shall match those applied to the structure by the contractor's "means and methods" of demolition/dismantling.

The demolition/dismantling plan shall be provided to the Division's Project Supervisor at least seven calendar days prior to the beginning of any demolition/dismantling work. Receipt of the demolition/dismantling plan does not constitute review or approval or relieve the Contractor of his/her responsibility to satisfactorily demolish/dismantle the structure specified.

203.2-MATERIALS:

Not specified.

203.3

203.3-CONSTRUCTION METHODS:

The work shall include dismantling and storing, or disposing of designated structures by such methods as are specified on the Plans. If the old structure is to be reerected, it shall be carefully dismantled without unnecessary damage, the parts matchmarked, and carefully stored as required by the Plans or as directed by the Engineer. Disposal, if required, shall be accomplished in accordance with the provisions of 201. The bridge may contain lead base paint and the Contractor shall provide protection for their Workers as per the requirements of 29 CFR 1926.62.

203.4-METHOD OF MEASUREMENT:

"Dismantling Structures" will be measured as a complete unit and shall include the complete execution of the work of dismantling, handling, storing, or removing all of the structures so designated.

203.5-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract lump sum price bid for this item, which price and payment shall be full compensation for completing the item, including removal and disposition of all falsework, debris and refuse resulting from the work, leaving the premises in good condition.

The cost of preparation and transmittal of the demolition/dismantling plan shall be included in the lump sum bid for Item 203001-.*.

SECTION 204
MOBILIZATION

204.1-DESCRIPTION:

This work shall consist of the performance of construction preparatory operations, including the movement of personnel and equipment to the project site and for the establishment of the Contractor's offices, buildings and other facilities necessary to begin work on a substantial phase of the contract. The bid for mobilization shall be a lump sum. When Item 204001-*, "Mobilization", is not included as a separate bid item it is specifically understood that the cost of mobilization will be included in the unit bid price for each individual item.

204.2-MATERIALS:

Not specified.

204.3-CONSTRUCTION METHODS:

Not Specified.

204.4-METHOD OF MEASUREMENT:

The method of measurement will be a lump sum.

TOTAL ORIGINAL CONTRACT AMOUNT, INCLUDING MOBILIZATION		TOTAL LIMITS FOR PARTIAL PAYMENTS
More Than	To and Including	
0	\$100,000	10 percent of total contract amount
\$100,000	\$500,000	\$10,000, plus three percent times (total contract minus \$100,000)
\$500,000	\$1,500,000	\$22,000, plus two percent times (total contract minus \$500,000)
\$1,500,00	More	\$42,000, plus one percent times (total contract minus \$1,500,000)

204.5-BASIS OF PAYMENT:

Partial payments will be made as the work progresses in accordance with the following schedule.

- i. 1.5% of the original contract amount or 50% of the amount bid for mobilization, whichever is less, will be released to the Contractor as the first estimate payable, not less than 15 days after the start of work at the project site.
- ii. 1.5% of the original contract amount or the remaining 50% of the amount bid for mobilization, whichever is less, shall be released with the estimate payable 30 days after the first estimate.

Upon completion of all work on the project, payment of any amount bid for mobilization in excess of 3% of the original contract amount will be released.

Nothing herein shall be construed to limit or preclude partial payments otherwise provided for by the contract.

No deduction will be made, nor will any increase be made, in the lump sum mobilization item amount regardless of decreases or increases in the final total contract amount or for any other cause.

205 THROUGH 206-BLANK

SECTION 207

EXCAVATION AND EMBANKMENT

207.1-DESCRIPTION:

This work shall consist of excavation for the roadway and channel changes including the removal and hauling of all material, of whatever character encountered, not being removed under some other item; preparing areas upon which embankments are to be placed, and constructing embankments with excavated material; disposing of unsuitable and surplus material; preparing the subgrade; finishing shoulders, slopes, ditches and drains; constructing benches and removing slides as may be required by the Plans or as directed by the Engineer; all in accordance with these Specifications and in reasonably close conformity with the lines, grades, thicknesses and cross sections shown on the Plans or established by the Engineer.

The compaction of embankments and subgrades will be accepted in accordance with these Specifications and the applicable requirements of 105, 106, and 109.

207.2-MATERIALS:

Materials shall meet the requirements specified in 715.11 and 716.

207.2.1-Quality Control Testing: Quality control of the embankment and subgrade material is the responsibility of the Contractor as specified in 106.1.

The Contractor's personnel shall include at least one qualified technician who shall be responsible for all field sampling and testing necessary to determine the magnitude of the various properties of the embankment and the subgrade governed by the Specifications and shall maintain these properties within the limits of this Specification.

The Contractor shall notify the Engineer prior to construction of the test strip as set forth in MP 700.00.24. Further, the Contractor shall record the data for all compaction testing on the forms as set forth in MP 700.00.24 and maintain records of the equipment used to compact the material in accordance with 716.3.2.3. Completed test data forms shall be provided to the Engineer at or immediately after the time of testing.

The Contractor shall design a quality control plan detailing the methods, including sampling and testing, by which the quality control program will be conducted. The plan, prepared in accordance with the guidelines set forth in MP 717.04.21, shall be submitted to the Engineer at the pre-construction conference. The work shall not begin until the plan is reviewed for conformance with the contract documents.

CONSTRUCTION METHODS

207.3-ROADWAY EXCAVATION:

207.3.1-Slopes: Slope lines shall conform to the lines and grades shown on

the Plans or established by the Engineer within the following tolerances: For all slopes back of the ditch line a construction tolerance of plus or minus 1 ft. (300 mm), measured in a horizontal plane, will be permitted. No change will be permitted in the width, grade or dimensions of the roadway ditch due to the tolerance. The slope may be varied only by permission of the Engineer. Slopes shall be trimmed neatly to present a uniform surface, free from hollows or protrusions and loose or overhanging rocks. Slopes shall not be undercut. The tops of all slopes, except where the material is of solid rock, shall be rounded as shown on the Plans.

The Contractor shall take precautions by benching or other methods, as directed by the Engineer, to prevent slides and slipouts.

In all roadway cuts, including areas where ledges of rock or hard shale, boulders, coal or other solid formations are encountered at or near subgrade elevation, the excavation shall be carried to a minimum depth of 6 inches (150 mm) below the surface of the subgrade for the full cross section width of the roadway between the ditches. The surface of all areas excavated below subgrade elevation shall be graded in such a manner that undrained pockets are eliminated before placing subgrade material. Excavation to the 6 in. (150 mm) limit will be paid for at the contract unit price bid for "Unclassified Excavation". Excavation made below this 6 in. (150 mm) limit will not be paid for.

207.3.2-Use of Explosives: The provisions of 107.11 will be enforced. The Contractor shall not employ any method of blasting which will result in breakage beyond the slope line, or which is dangerous to the public or destructive to property. Excessive blasting or "over-shooting" will not be tolerated. Any material outside the authorized cross section which becomes shattered or loosened by blasting shall be removed without compensation if so ordered by the Engineer.

207.3.3-ROCK EXCAVATION:

207.3.3.1-Presplitting Technique: When explosives are used in excavation, the presplit technique shall be used except for fill bench construction and where slopes flatter than 1 to 1 are designed. This involves a single row of holes drilled along the neat excavation line and the blasting charge fired before any adjoining main excavation area is blasted. Depending on the type of rock, the drill holes for the presplitting shall be on centers from 2 ft. to 5 ft. (0.6 to 1.5 meters) as determined by field demonstration.

The holes to be loaded for presplitting shall be string loaded as recommended by the manufacturer of the explosives. The presplitting may be accomplished during the primary blast by delaying the primary holes so the presplitting holes will fire ahead of them. The end result is intended to yield a minimum of breakage outside the neat line of the plan cross sections. The Contractor shall make available upon request a record of the spacing and the amount and type of explosives used in the presplit operation.

207.3.4-Archeological and Historical Findings: Should the Contractor's

207.4

excavation operations encounter remains of prehistoric people's dwelling sites or artifacts of historical or archeological significance, the operation in that locality shall be temporarily discontinued. The Engineer will contact appropriate authorities to determine the disposition thereof. When directed by the Engineer, the Contractor shall excavate the site in such manner as to preserve the artifacts encountered and shall remove them for delivery to the custody of the proper State authorities. Such excavation will be considered and paid for as "Extra Work".

207.4-BENCHES:

Benches to be constructed either above or below the profile grade shall conform to the dimensions shown on the Plans or as directed by the Engineer. Necessary drainage shall be placed as directed before backfilling. The Contractor shall arrange benching operations to allow sufficient time for the Engineer to complete all cross sections before placing embankment material.

207.5-DITCHES:

Ditches, drains, channels, and stream changes, including inlet and outlet ditches for culverts, shall be constructed where shown on the Plans or as directed by the Engineer. Diversion ditches, where specified, shall be cut beyond the rounded edges of slopes. Ditch slopes shall be rounded and trimmed neatly to line, and flow lines shall be trimmed of irregularities in the grade which might cause surface water pockets.

207.6-DISPOSAL OF MATERIAL:

207.6.1-Suitable Material: All suitable material excavated as above provided shall be used for forming embankments for the roadways, connecting roads, ramps and approaches; for constructing subgrade and shoulders; around structures and buildings; or for any other purpose necessary for the completion of the project as shown on the Plans or directed by the Engineer.

Random material, hard shale and rock, as defined in 716, are suitable for use in embankments. Within soil groups, preference shall be given to the more granular soils which have greater dry weights, greater percentages of coarse and fine aggregate, and lower liquid limits.

Where the quantity of suitable material for certain work is limited, such material shall be reserved for the purpose as directed by the Engineer. Should the Contractor fail to reserve such available material when so directed, replacement shall be made by the Contractor at no additional cost to the Division.

207.6.2-Unsuitable Material: Materials which cannot be satisfactorily placed and compacted to a stable and durable condition may be designated as unsuitable by the Engineer. Sod, trash, organic substances, and muck are considered unfit for use in embankments.

Soil to be excavated, or being excavated, that contains excessive moisture

shall also be considered unsuitable for use in embankments. However, the Contractor may at their option dry the material and use it in the construction of embankments. Aeration, or other drying method, shall be at the expense of the Contractor. If the Contractor elects to waste rather than dry, suitable replacement material, if needed to complete embankments or otherwise fulfill the intent of the Plans, shall be furnished and placed by the Contractor at their expense. Any material borrowed to obtain necessary replacement material shall be accomplished in accordance with the provisions of 211.

207.6.3-Waste: The Contractor shall locate and furnish all sites for disposition of waste and surplus material, except those sites shown on the Plans. When directed by the Engineer, surplus material shall be used in uniform flattening of embankment slopes or widening of shoulders within the right-of-way limits. Steepening of slopes will not be permitted.

Before any waste will be permitted, the Contractor shall prepare a plan showing the limits and details of the proposed waste site, except as provided. Such plans shall be submitted to the Engineer for review and approval before disposition of waste material is begun. Upon completion of work, all waste sites shall be neatly trimmed and drained and all debris and spoil disposed of in accordance with the approved plan. No material shall be wasted at places other than those approved, except as provided, nor shall any material be wasted above established grades of any road unless authorized by the Engineer in writing. Waste areas shall be graded, fertilized, seeded and mulched by the Contractor in accordance with 652 of these Specifications.

For small quantities, not to exceed 300 cu yd, of waste outside the right-of-way limits, the Contractor need not prepare a plan showing the limits and details of the proposed waste site, and need not secure approval of the Engineer. For such small quantities of waste outside the right-of-way limits, the Contractor shall comply with existing laws and save the State harmless from any claims for damages which may result from the waste. In addition, the Contractor shall also comply with the provisions stated above with regard to trimming, draining, fertilizing, seeding and mulching.

The Contractor shall conduct all wasting operations so as to minimize pollution or sedimentation of rivers, streams, lakes, ponds, or other bodies of water.

Construction/Demolition Waste Material as defined in Section 207.6.5 will not be permitted in a site provided by the Contractor for disposal of surplus material except as follows:

Portland cement concrete and hot-mix asphalt removed from a project may be disposed of in a waste site provided the following requirements are met:

- 1) Placement shall be in accordance with Section 207.7.3.2.3-Rock.
- 2) All Portland cement concrete and hot-mix asphalt in the waste site shall be covered with 2 ft. (600 mm) of soil.

207.6.4

- 3) The plan approved by the Engineer for the waste site shall show the location of any Portland cement concrete and hot-mix asphalt to be wasted and/or the original plan supplemented as required.
- 4) The area of disposal for hot-mix asphalt shall be limited to two acres (.8 Ha) and may be located within a waste site covering more than two acres (.8 Ha).
- 5) Portland cement concrete or other masonry type products will not count against the two acre (.8 Ha) maximum size if all the reinforcing steel and/or wire mesh have been removed or cut off flush at the outer edges.
- 6) The area of disposal of Portland cement concrete and hot-mix asphalt shall be completed and covered within 180 days.
- 7) The disposal area of Portland cement concrete and hot-mix asphalt shall not be within 300 feet (91m) of a wetland, within a perennial stream, or within a 100-year floodplain.
- 8) The requirements as set forth in Section [207.6.5](#) Construction/Demolition Waste Material are to be followed.

207.6.4-Conduit: Conduit designated to be relaid shall be removed with care and stored where it can be protected from damage until reused. The Contractor shall replace sections lost from storage, damaged by negligence, or used in an improper manner.

207.6.5 - Construction/Demolition Waste Material: Disposal of Construction/Demolition waste material outside of the Division's right-of-way is controlled by the West Virginia Division of Environmental Protection (DEP), Office of Waste Management, Solid Waste Management Section in accordance with West Virginia Code, Chapter 22, Article 15 and West Virginia Administrative Regulations, 33 CSR 1 and is defined as follows: "... means waste building materials, packing, and grubbing waste, resulting from construction, remodeling, repair and demolition operations on houses, commercial and industrial buildings, pavements, including, but not limited to, wood, plaster, metals, asphaltic substances, bricks, blocks and concrete, other masonry materials, but does not include asbestos waste." Hazardous Waste will be disposed of in an approved area for that particular material.

Construction/Demolition waste material cannot be disposed of outside of the Division's right-of-way unless it is taken to a DEP approved commercial landfill or a permit from DEP is obtained by the land owner or Contractor in accordance with the above cited statute and regulations.

Construction/Demolition waste material consisting of concrete, asphalt, crushed stone, bricks and blocks may be disposed of within the Division's

right-of-way with approval of the Engineer. The waste material shall be covered with a minimum of 2 feet (600 mm) of soil, drained, and seeded.

The landowner or Contractor must apply for and receive approval for all Construction/Demolition waste areas outside of the Division's right-of-way from the DEP prior to use. The disposal of trees, stumps, woodchips, and yard waste generated from land clearing when generation and disposal occur on the same property is exempt from the requirements of DEP approval. A landowner using Construction/Demolition waste material to improve the grade of the land and if the area of that land does not exceed one-half acre (.2 Ha) is exempt from the requirements of DEP approval provided that the landowner or contractor does not fill wetlands, adheres to best management practices for construction and maintains cover over the material. The Construction/Demolition waste material exemption for landowners does not apply to multiple one-half acre (.2 Ha) sites on the same parcel of land.

The Contractor shall not create any temporary disposal sites on the right-of-way but must dispose of all Construction/Demolition waste in accordance with this section.

207.7-FORMING AND COMPACTING EMBANKMENT:

Slope lines for all embankments shall conform to the lines shown on the Plans or established by the Engineer, except that a construction tolerance of plus or minus 1 ft. (300 mm), measured in a horizontal plane, will be permitted, except further that the roadbed width due to the tolerance shall not be less than plan width. The slopes may be varied only by permission of the Engineer. Slopes shall be trimmed to present a neat and uniform surface, free from hollows or protrusions. The tops of all slopes shall be rounded as shown on the Plans.

207.7.1-Preparation: When fills are 5 ft. (1.5 meters) or less in depth, the top soil and sod shall be stripped to the depth specified by the Engineer, and the top 8 inches (200 mm) of the embankment foundation shall be scarified and compacted to the density requirements specified.

If the required density is unobtainable due to excessive moisture, organic substances, or other causes, the Contractor may be required, as directed by the Engineer, to remove and waste the in-place material to a depth prescribed by the Engineer before starting embankment; or to place an initial layer of rock, hard shale, or granular material, thickness to be prescribed by the Engineer; or both.

When embankments of less than 3 ft. (1 meter) in depth are to be placed upon old concrete pavements or pavements with concrete base, the pavements or base shall be removed and disposed of unless otherwise directed by the Engineer. When embankments of 3 ft. (1 meter) or more in depth are to be placed on old concrete pavements, the pavements shall be broken up in pieces not to exceed one square foot (90000 square mm) and may be left under the new embankments, unless otherwise directed by the Engineer. When embankments are to be placed upon other than rigid types of pavement, the

207.7.2

pavements, shall first be scarified to their full depth and recompact.

All existing slopes, other than rock, against which embankments are to be placed shall be plowed or deeply scarified so as to allow blending of the in-place material with the embankment material. When specified in the Contract or directed by the Engineer, the slopes shall be benches before the embankment is placed.

Prior to the commencement of excavation and embankment, when called for in the Contract, top soil shall be salvaged and stockpiled at the locations designated by the Engineer. Construction and payment procedures shall be in accordance with 651.

207.7.2-Materials for Formation and Compaction of Embankments:

Embankment materials, test methods and the Contractor's quality control requirements shall conform to be applicable provisions of 716.

207.7.3-Placing Embankment:

207.7.3.1-General: No embankment shall be placed on frozen material. During the process of excavation and embankment construction, the roadway shall be maintained in such a condition that it will be well drained at all times. Depositing and compacting embankment in layers shall be started at the lowest point of the fill below grade, at the bottom of ravines, and at the foot of slopes on side hills. Unconsolidated soil or random material, unless removed under other provisions of the Specifications, shall be removed as directed by the Engineer, replaced and compacted as specified before placing embankment thereon. The layers shall be constructed approximately parallel with finished grade. Each layer, before starting the next, shall be leveled and smoothed by means of power driven graders, dozers or other suitable equipment with adequate weight, capacity and power to do the work. Layers shall be extended across the entire fill at the level of deposition unless otherwise authorized by the Engineer. Each layer, before starting the next, shall be compacted.

Materials to be used in any area of an embankment shall be free from stumps and spongy or frozen soil. The amount of organic material shall be no greater than that specified in the applicable provisions of 716.

Soil having organic material greater than that specified in 716 shall be disposed of as directed in 207.6.3. Embankments at bridge abutments shall be free of rock in the area where piles are to be driven, unless otherwise specified.

Where rock is required for the entire embankment at bridge abutments, the piles will require predrilling. Predrilling may be required for other embankments where the depth, density of material, or negative skin friction require it. When embankment is being formed around structures, the material shall be deposited on both sides of the structure in approximately level layers and in accordance with 212.10.

The plan and sequence of operations shall make use of all the rock obtained from the excavation or borrow in accordance with the following provisions.

Rock occurring in the excavation shall be placed to form the base for

embankments, to form select embankment layers, to form drainage systems, to form the outer edges of embankments under construction or to widen previously constructed embankments. In all rock slopes, the large rocks shall be placed at the outer face and the smaller rocks and spalls near the center. The rock shall not be dumped in place but shall be distributed and placed the full width of the lift being formed by blading or dozing in a manner to assure proper placement in the final position in the embankment. The larger rock shall be well distributed and the voids, pockets, and bridging reduced to insure minimum deformation and still permit drainage where required. When there is insufficient material, other than rock, encountered in the excavation to permit the other material being properly compacted in layers, the other material will be reserved to be placed as directed by the Engineer. Material that is too wet to be properly compacted shall not be used to fill the voids of previously placed rock. Random material that meets moisture requirements may be blended with rock and shall be placed in the embankment in lift thickness as prescribed.

To the extent that it is available and needed, sufficient suitable material shall be reserved from the unclassified excavation for use in filling voids in the top of the rock fill.

Where rock is placed on an embankment of other material, the top of the other material shall be sloped from the center to the sides at a rate of approximately four percent.

207.7.3.2-Lift Thickness: The Contractor shall record material type and the lift thickness for all types of embankment.

When embankments are to be constructed across low swampy grounds which will not support the weight of trucks or hauling equipment, the lower part of the fill may be constructed by dumping successive vehicle loads of rock, hard shale or granular material in a uniformly distributed layer. The thickness of a layer shall not be greater than that necessary to support the vehicle placing subsequent layers, after which the remainder of the embankment shall be constructed in layers and compacted as specified.

In places inaccessible to a roller, such as adjacent to culverts, retaining walls and other structures, the fill material shall be placed in 4 in. (150 mm) compacted layers, uniformly compacted with approved tampers.

207.7.3.2.1-Random Material (Soil, Granular Material and Soft Shale): Random material as defined in 716 shall be placed in embankments in successive layers not to exceed 6 inches (150 mm) in thickness after compaction.

207.7.3.2.2-Hard Shale: This material is defined in the applicable provisions of 716. When suitable random material is to be mixed with hard shale, this mixture shall be placed in the embankment in lift thicknesses prescribed. Mixtures which contain 66 percent or more of suitable random material shall be placed in lifts not to exceed 6 inches (150 mm) in thickness after compaction. Mixtures which contain 35 to 65 percent (by visual

207.7.3

inspection) of suitable random material shall be placed in lifts not to exceed 12 in. (300 mm) before compaction. Mixtures which contain from zero to 35 percent (by visual inspection of suitable random material shall be placed in lifts not to exceed 24 in. (600 mm). The lift thickness shall be as thin as the excavated material will permit.

207.7.3.2.3-Rock: This material, as defined in 716, shall be placed in the embankment in layers of thickness as prescribed.

Mixtures which contain 66 percent or more (by visual inspection) of suitable random material shall be placed in lifts not to exceed 6 inches (150 mm) after compaction. Mixtures which contain 35 to 65 percent (by visual inspection) of suitable random material shall be placed in lifts not to exceed 12 in (300 mm) before compaction. Mixtures which contain zero to 35 percent (by visual inspection) of suitable random material shall be placed in lifts not to exceed 36 in (900 mm). The lift thickness shall be as thin as the excavated material will permit.

Rock lifts that are designated as Select Embankment shall contain no more than 15 percent of other suitable embankment material (by visual inspection). The dominant rock size shall be 6 inches, (150 mm) and greater. During excavation and handling, the Contractor shall avoid contaminating the Select Embankment with other embankment materials. Rock for Select Embankment shall be reserved from the excavation up to the plan quantity required. If Select Embankment from the excavation is wasted prior to meeting the plan quantities, the Contractor shall be responsible, and bear the expense, for replacing the material wasted up to the plan quantity. Rock lifts in embankment shall be placed in approximately level layers of uniform thickness. The size of the rock lifts shall not exceed 36 inches (900 mm). The rock shall not be greater in any dimension than 36 inches (900 mm).

When rock is used as a lining for drainage channels, it shall be placed to the thickness called for on the plans or cross sections. The dimensions of the rock may be as large as the thickness of the blanket will permit.

207.7.4-Compaction of Embankments: Embankment material consisting of random material and hard shale as described in 716, which does not contain sufficient moisture to be compacted to the requirements specified, shall receive applications of water necessary for compaction. Water shall be applied with suitable sprinkling devices and shall be thoroughly incorporated into the material which is to be compacted. Embankment and subgrade materials which contain excess moisture shall be dried, prior to or during compaction, as necessary to obtain satisfactory compaction.

Layers of soil shall be moistened or dried to the tolerance specified in 716.3.1 at the time compactive effort is applied. Water shall be added to or excess moisture removed from soils by the use of plows, discs, or other methods.

Each layer of embankment shall be uniformly compacted to the applicable requirements specified in 716.

Hard shale shall be broken down in placing by manipulating with tractors, bulldozers, power graders, rollers, or other approved devices until voids between particles are substantially filled. This material shall be compacted and shall be at a moisture content that will provide proper compaction.

Rock shall be placed as required under 207.7.3 and compacted, using the equipment specified in 207.7.5, to the satisfaction of the Engineer.

207.7.5-Compaction Equipment: Sufficient leveling and compacting equipment shall be provided to do the work of leveling and compacting without delay after the material has been deposited. When the equipment is inadequate for the rate of depositing, the rate of excavation and placement of fill shall be reduced to a rate not to exceed the capacity of the leveling and compacting equipment, with particular attention to the loss of moisture during the delay. When two or more fills are being constructed and are so isolated from one another that one roller cannot compact the fills satisfactorily, additional rollers shall be provided as ordered by the Engineer.

Vibratory compactors, grid, paddle-foot, or vibratory rollers, or other compacting equipment approved by the Engineer, shall be used for fills constructed of materials which are predominately rock or hard shale.

Approved pneumatic or power driven backfill tampers shall be used in areas inaccessible to rollers.

Three-wheel rollers shall weigh not less than 10 tons (9 Mg). They shall be of sturdy construction and especially designed for heavy work. They shall be in good mechanical condition and have sufficient power to travel over rough surfaces and steep grades.

Pneumatic tired rollers shall operate on two axles in such manner that the rear group of tires will not follow in the tracks of the forward group. They shall be mounted on a rigid frame and have a loading platform or body suitable for ballast loading. The pneumatic tired rollers, under working conditions, shall have a minimum rolling width of 60 in. (1.5 meters) and shall give a minimum compression of 325 lb. per in. (2.24 KN/mm) of width of tire tread.

Single axle pneumatic rollers of an approved type may be used, providing the requirements as to width and compression per inch (mm) of width of tire tread are met.

Tamping rollers shall consist of metal rollers, drums, or shells surmounted by metal studs with self-cleaning tamping feet. The cross sectional area and spacing of tamping feet and the weight of the roller shall be such that the compaction or density for the particular material shall be obtained as specified. Each tamping roller shall consist of at least two sections not rigidly joined.

Grid rollers shall consist of drums at least 5 ft. (1.5 meters) in diameter whose cylindrical faces present the appearance of an open woven bar mesh. Each drum shall be at least 2 ½ ft. (750 mm) long and they shall be independently mounted close together on the same axle. The complete roller, when operating without ballast, shall weigh not less than six tons or 200 lb. per in (5.4 Mg or 1.38 KN/mm) of length of roller drum.

Arrangements shall be provided for adding ballast, as directed by the

207.8

Engineer, to such an extent that the total weight of the unit can be increased to at least 15 tons and 500 lb. per in. (13.5 Mg and 3.45 KN/mm) of length of roller drum. Grid rollers shall make at least three complete coverages of each layer or until the required density is obtained.

The use of trucks, carryalls, scrapers, tractors, tractor wagons, or other haulage equipment shall not be considered in lieu of compacting equipment prescribed, but the traffic of such hauling equipment shall be distributed over the fill in such a manner as to make use of the compaction afforded as an addition to compaction by rolling or vibrating.

207.8-FINISHING EARTH ROADS:

When no pavement or surfacing is included in the Contract, the roadway shall be finished as a graded earth road. The roadway, shoulders, and superelevated curves shall be constructed simultaneously to the required cross section and grade. Unsatisfactory or unsuitable material shall be removed and replaced as specified in 207.9. The entire surface shall be brought to a smooth condition by repeated use of an approved power grader and continuously maintained in a condition suitable for traffic until final completion and acceptance of the work. When grading work is being done simultaneously on more than one section of a Contract, an approved grader shall be furnished on each section if so required by the Engineer.

207.9-SUBGRADE:

The subgrade shall be constructed in accordance with these Specifications, in substantial conformity with lines, grades, and cross sections shown on the Plans or established by the Engineer.

The subgrade shall be 6 inches (150 mm) compacted thickness for all embankment and excavation sections and shall be constructed out of suitable material free of particles larger than 3 inches (75 mm) and consisting of granular material, conforming to the requirements of 716.1.1.2, that can be satisfactorily compacted to a stable condition. The tolerance set forth in 314.6 shall apply. Excavation to the 6 in. (150 mm) limit in cut sections will be paid for at the contract unit price bid for "Unclassified Excavation". Excavation made below this 6 in. (150 mm) limit in cut sections will not be paid for, except, when unsuitable material is removed as specified below, payment will be made for removal to an additional depth of 12 inches (300 mm) of this unsuitable material with the actual locations and depth of removal established by or acceptable to the Engineer.

The subgrade layer or layers shall be moistened or dried to a uniform moisture content suitable for maximum compaction and brought to a firm unyielding condition by compaction. The subgrade shall be uniformly compacted to the applicable requirements specified in 716.

The surface of the subgrade shall be maintained in such condition that it will drain at all times.

When trenching is done for narrow base widening, ditches of an adequate depth shall be constructed across the shoulders at sufficient intervals to permit

a free outlet of water. Equipment or vehicles shall not be allowed to travel in a single track and form ruts in the subgrade. Any ruts or irregularities formed in the subgrade shall be scarified and recompacted.

When the construction of a base, pavement, or surface is included in the Contract, or is so provided on the Plans, the profile grade of the subgrade shall be such that the specified thickness of the base course, pavement and surface will be obtained within limits of final surface grade. Any grade revision necessitated shall be called to the attention of the Engineer.

When unsuitable material is encountered at the subgrade elevation, it shall be removed to a depth of 12 in. (300 mm) and replaced with suitable material.

When so designated, engineering fabric for subgrade stabilization, conforming to 715.11, shall be installed over the area which shall be relatively smooth, free of sharp protrusion, depressions or debris. The fabric shall be placed with the machine direction of the fabric parallel with the alignment and shall be relatively smooth and free from creases. The joining of fabrics shall be accomplished by sewing (either in the field by portable sewing machine or during manufacture of the fabric) as outlined in 715.11.3 or shall be installed so any splice joints have a minimum overlap of 3 ft. (900 mm) or as directed by the Engineer.

Once the fabric is placed, cover material shall be brought to the working face, dumped and spread with equipment exerting the minimum ground pressure possible. Construction equipment shall not operate directly on the fabric. A minimum of 6 inches (150 mm) of cover material shall be maintained between the construction equipment and the fabric.

Compaction shall be accomplished by conventional methods after the cover material is spread. Sheepfoot rollers will not be permitted.

The completed subgrade shall present a uniform appearance and shall be checked for conformity to the lines, grades, and dimensions shown on the Plans.

When the Plans require engineering fabric for subsurface drainage or separation, the material shall conform to 715.11 and be placed as fabric for stabilization except the fabric may be joined by overlapping so the splice joints have a two foot (600 mm) minimum overlap. Construction equipment is permitted on the fabric provided all damage is repaired as specified in 715.11.3. When the fabric is placed in structure backfill applications, such as bridge abutments, the orientation of the fabric will be directed by the Engineer.

207.10-SHOULDERS:

Before any base or pavement may be placed upon the subgrade, the shoulders along and adjacent thereto shall be built to the dimensions shown on the cross section. In order to provide adequate side support for macadam or other stone types of base or surface, shoulders shall be constructed full width, substantially to line and grade and to the depth of the course being constructed, and compacted with at least a 10 ton (9 Mg) roller, and then trimmed to the required line. When concrete base or pavement is being constructed, or where the shoulders are to be built of stabilized material, these requirements may be

207.11

waived by the Engineer.

Upon completion of the base, pavement, or surfacing, the shoulders shall be finally shaped, dressed, and compacted to conform to the dimensions shown on the Plans. No stone exceeding 3 inches (75 mm) in maximum dimension will be permitted within 3 inches (75 mm) of the surface. The outer edge of the shoulder shall be trimmed to a neat line parallel with the centerline of the roadway, and the entire surface rolled to within 12 in. (300 mm) of the outside edge, refilling and rerolling any depressions that develop. Ditches and back slopes shall be finally cleaned and trimmed to line upon completion of the shoulder work.

The in-place density of shoulders shall be as specified for the subgrade in 716.

207.11-DRAINAGE:

When grading, subgrading, constructing shoulders, or placing base or pavement is suspended because of unsuitable weather or any other reason, suitable provisions shall be made to drain the grade, subgrade or shoulders by means of the construction of adequate side ditches and drains. The ditches and drains shall be kept open and maintained during the period of suspension, including the removal of slides. Upon failure of the Contractor to construct and maintain the temporary drains prior to the acceptance of the work, the Engineer may cause such work to be done by others, and the cost will be deducted from moneys due the Contractor.

Upon completion of the subgrade or shoulders and before any base on pavement is placed, subgrade drains or weeps shall be placed as shown on the Plans or as directed by the Engineer in accordance with 606.

207.12-TEMPORARY SURCHARGE:

When shown on the Plans or directed by the Engineer, a temporary surcharge composed of suitable compacted material from the "Unclassified Excavation" or "Unclassified Borrow Excavation" shall be placed after completion of the embankment to the elevations of the base of the subgrade.

The temporary surcharge shall be placed in accordance with location limits and elevations shown on the Plans or as directed by the Engineer. Surcharge material shall be placed in accordance with the provisions of 207.7. The first 5 ft. (1.5 meters) of the surcharge shall be compacted as specified for embankment in the applicable provisions of 716. The remaining surcharge shall be compacted as specified above except that the target percentage of dry density shall be 90 percent.

The surcharge shall be maintained for the period indicated on the Plans or directed by the Engineer.

207.13-PROTECTION OF CURTAIN WALLS:

All bridges which will be used for permissible haulage, but which do not have the approach slabs constructed, shall have the pavement notch of the curtain walls built up to final grade by the use of timber to eliminate the

possibility of damage to the curtain walls.

207.14-SLIDES AND SLIPOUTS:

Material outside the planned roadway or ditch slopes which, in the opinion of the Engineer, is unstable and constitutes a potential slide area, material from slides which has come into the roadway or ditch, and material which has slipped out of new or old embankments shall be excavated to designated lines or slopes either by benching or in such manner as directed by the Engineer. Such material shall be used in the construction of the embankments and in flattening of slopes, or disposed of as directed by the Engineer.

Erosion, regardless of amount or extent, caused by the action of the elements and which results in damage to the work or materials shall in no case be considered a slide or slipout.

207.15-METHOD OF MEASUREMENT:

The quantity of work done will be measured in cubic yards (cubic meters) for Item 207001-*, "Unclassified Excavation", which shall be the material actually moved and disposed as herein prescribed, measured in its original position and determined from the cross sections by the method of average end areas. The quantity of unclassified excavation for payment will be the number of cubic yards (meters) as further described. The quantities shall be computed using the cross section areas shown on the Plans with deductions from or additions to such cross section areas in accordance with 109.2 and authorized deviations. The quantity for payment will be to plan lines for material excavated in accordance with the construction tolerance set forth in 207.3.1 except as provided. In no case where the tolerance line has not been reached will the quantity for payment exceed the quantity actually excavated; unless otherwise authorized, the Contractor will be required to continue or resume excavation until within tolerance rather than receive payment for a lesser (out-of-tolerance) excavated quantity.

No material removed beyond the slope lines or below the grade line shown on the Plans, except as provided in 207.3.4 and 207.9, will be included for payment unless authorized in writing by the Engineer. Slides and material removed from beyond the slope lines, not attributable to carelessness, overshooting, or unsuitable construction methods on the part of the Contractor, will be included only when so authorized.

Excavation below grade, including undercutting, as shown on the Plans or as directed by the Engineer; ditches to divert water from the slopes of cuts; inlet and outlet ditches for drainage structures; other ditches as authorized by the Engineer; removal of topsoil, sod, old pavement, boulders, walls, and other unsuitable material within the areas upon which the embankment is to be placed; benching; and all other excavation authorized but not shown by the cross sections, will be measured separately and included for payment.

Where stone base or concrete pavements have been scarified or broken but not removed, or slopes other than rock upon which embankments are to be made are plowed or scarified and the loose soil has been manipulated and

207.16

compacted but not removed, such work and all the work of placing and compacting all embankments, widenings or waste pits, placing and consolidating rockfills, will be considered as a necessary part of manipulation, the cost of which is included in the price bid per cubic yard (meter) for "Unclassified Excavation".

Payment for placing of temporary surcharge will be included in the contract unit price for "Unclassified Excavation" or "Unclassified Borrow Excavation", as the case may be. Removal of temporary surcharge will be paid at the contract unit price for "Unclassified Excavation".

The removal and disposal of slide and slipout material in accordance with 207.14 will be paid for at the contract price for "Unclassified Excavation", unless the Engineer, prior to the removal of such material, orders the slide or slipout material to be removed and disposed of as "Extra Work", or the Contractor, prior to performing any such work, requests in writing that the removal and disposal of any such slide or slipout material be paid for as "Extra Work", and the Engineer approves.

The cost of any work outside the limits of the slide necessary to make slide or slipout areas accessible to normal excavation equipment will be paid for as "Extra Work".

The above provisions shall not be so construed as to relieve the Contractor from the duty of maintaining all slopes true and smooth.

The quantity of subgrade work done under this item will be the number of cubic yards (meters) of "Subgrade" established in the Proposal, subject to adjustment as provided for in 104.2 and 109.2. Any additional work beyond the scope of the original Plans but authorized by the Engineer will be measured in cubic yards (meters), compacted in place, and paid for at the unit bid price for subgrade, subject to the provisions of 104.2.

Subgrade constructed outside the lines, dimensions and cross sections shown on the Plans or designated by the Engineer will not be measured for payment.

Measurement and payment for subgrade drains will be in accordance with the provisions of 606.

The work done for Item 207009-*, "Unclassified Excavation" will be measured on a lump sum basis.

The quantity of engineering fabric placed in subgrade stabilization or subsurface drainage or separation will be measured by the square yard (meter) complete in place and accepted, excluding laps.

207.16-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for these items, which prices and payments shall be full compensation for doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipments, supplies, and incidentals necessary to complete the work.

The cost of unclassified excavation including the hauling of all material, any reserving and rehandling of unclassified excavation material, embankment

construction including compaction, furnishing and applying water as an aid to embankment compaction, and the cost of furnishing additional waste sites, grading, fertilizing, and seeding and mulching of all waste sites, shall be included in the unit price bid for "Unclassified Excavation".

The cost of furnishing all materials, including furnishing and applying water necessary as an aid to subgrade compaction, shall be included in the unit price bid for "Subgrade".

208 THROUGH 210-BLANK

SECTION 211 BORROW EXCAVATION

211.1-DESCRIPTION:

This work shall consist of furnishing, excavating, transporting, placing, compacting, and furnishing material required to complete the roadway and embankments;

211.2-MATERIALS:

211.2.1-Unclassified Borrow Excavation: Materials shall be obtained which are suitable for the particular purpose for which unclassified borrow excavation is authorized.

211.2.2-Rock Borrow Excavation: Material shall meet the requirements specified for Rock in [207.7.3.2.3](#).

211.2.3-Select Borrow Excavation: Material shall consist of a granular material as defined in [716.1.1.2](#) unless otherwise specified in the Contract.

CONSTRUCTION METHODS

211.3-GENERAL:

All borrow excavation materials shall be obtained in the amounts directed, by the methods and subject to the same provisions as prescribed in [207](#) except

211.4

as modified or amended. Borrow excavation should not be placed until after the roadway excavation has been utilized in the embankments and there is no likelihood of slips or excess material.

The Contractor shall submit to the Engineer for review and approval a site grading plan for borrow areas, except as provided. No borrow area shall be opened until authorized by the Engineer.

All borrow site grading plans will be submitted by the Contractor to the State Historic Preservation Officer (SHPO) for determination of the effects on cultural resources, such as Indian Burial Grounds. If the SHPO feels that there could be an effect on cultural resources a lengthy investigation could be undertaken. The cost of any investigation would be borne by the Contractor.

Probable sites that could require an investigation are flood plains of major rivers and large rock shelters.

Non probable locations of cultural resources would be steep hillsides and/or narrow valleys.

Temporary roads, haulways, or other facilities which may be required for the use or convenience of the Contractor in excavating and transporting borrow material shall be provided by the Contractor without cost to the Division.

Materials shall be obtained from borrow pits in a workmanlike manner so as to minimize pollution or sedimentation of streams, lakes, and reservoirs and to facilitate the work of measuring and calculating the volume of material removed.

Borrow pits shall not be excavated below the level of the natural drainage for the area, and the drainage ditches required to keep the pit free from standing water during the progress of the work and upon completion shall be constructed without extra compensation.

Upon completion of the work, the borrow pit shall be neatly trimmed and all debris and soil disposed of in an acceptable manner. Borrow pits shall be graded, fertilized, seeded and mulched in accordance with [652](#).

211.4-UNCLASSIFIED BORROW EXCAVATION:

Unclassified borrow excavation shall consist of material, as prescribed, incorporated into embankments, backfill, shoulders, or any other type of work shown on the Plans or designated by the Engineer. The method of placement, compaction and density shall be in accordance with the applicable requirements of [207.7](#).

211.5-ROCK BORROW EXCAVATION:

Rock borrow excavation shall consist of materials, as prescribed, incorporated into embankments in accordance with the provisions of [207.7](#) covering the construction of rock fills.

211.6-SELECT BORROW EXCAVATION:

Select borrow excavation shall consist of material as prescribed, incorporated into embankments, backfills, shoulders, or any other type of work shown on the Plans or designated by the Engineer. The method of placement, compaction and density shall be in accordance with the applicable requirements

for granular material as prescribed under 207.7.

211.7-METHOD OF MEASUREMENT:

211.7.1 – Cubic Yard (Meter) Measurement: The quantity of work done will be measured in cubic yards (cubic meters) actually obtained and incorporated in the work, determined in its original position from cross sections by the average end areas.

The method of measurement may also be calculated as 80 percent of the truck load volume of each truck used to haul the material. The measurement of the load will be taken inside each bed and will include length, width and average height to the top of the load. However, the measurement will exclude the hoist housing. When Rock Borrow is obtained from a commercial source payment may be per cubic yard by converting 1.65 tons (2 Mg) to equal 1 cubic yard (cubic meter).

If the borrow is obtained in such quantity or in such manner that a waste of unclassified excavation, slips, or excess material is caused, the amounts of such waste shall be deducted from the borrow volume. In determining the amount of material to be developed due to unauthorized placement of borrow material or unclassified excavation material in the embankments, the quantity outside the construction tolerance will be measured and deducted from borrow on a yard-to-yard (meter to meter) basis without adjustment due to shrinkage or swelling.

211.7.2 – Lump Sum Measurement: The work done will be measured on a lump sum basis.

211.7.3 – Ton (Megagram) Measurement: The quantity of work done will be measured in tons (megagrams) actually obtained and incorporated in the work, determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail, by actual measured displacement of barges certified by the Producer when water shipments are made, providing materials delivered by the aforementioned methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved truck scale, and certified by the Contractor to be correct.

The Producer or Contractor shall provide truck scales. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations, which will insure their retaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Department of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions. The Department may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time,

211.8

date, truck identification and project number. Provision shall be made for constant zero compensation and further provision shall be made so the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

A weighman shall be provided by the Producer/Supplier. The weighman shall certify that the weight of the material, as determined either by the scales or from the digital printout of the weights, is correct.

Each truck shall be weighed empty prior to each load.

211.8-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for these items, which unit prices and payments shall be full compensation for doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work. There will be no additional compensation for furnishing, grading, fertilizing, seeding and mulching of borrow pits.

SECTION 212

STRUCTURE, ROCK, AND WET EXCAVATION

212.1-DESCRIPTION:

This work shall consist of the excavation and backfill or disposal of all materials required to be removed for the construction of retaining walls, box culverts, catch basins, drop inlets, manholes, bridge foundations, and other structures for which excavation is not otherwise provided; the removal of all old structures, including abutments, piers and wingwalls, unless otherwise specified or directed; in accordance with these Specifications and in reasonably close conformity with the lines, grades and typical cross sections shown on the Plans or established by the Engineer. It shall include pumping, draining, sheeting, and constructing cribs and cofferdams if necessary.

212.2-MATERIALS:

Select material for backfilling shall be crushed stone, gravel, slag, or any combination thereof meeting the requirements of 703. The grading shall be such that 100 percent of the material passes the 2 in. (50 mm) sieve and 0 to 5 percent passes the No. 16 sieve. Any of the standard coarse aggregate sizes from AASHTO No. 4 through AASHTO No. 8 as shown in 703.4 will be acceptable.

Controlled low strength material shall meet the requirements of 219

Quality control of select material for backfilling is the responsibility of the Contractor as specified in 106.1.

The material shall be tested according to applicable methods specified in 716. The sampling frequency for gradation is specified in MP 717.04.21.

Acceptance for gradation will be on the basis of the Contractor's written certification that all such materials used for this item conforms to the specified requirements. The certification is to include the test results.

Engineering fabric shall be Fabric for Subsurface Drainage or Separation meeting 715.11.

CONSTRUCTION METHODS

212.3-GENERAL:

The foundation pits shall be excavated according to the outlines of footings as shown on the Plans and shall be of sufficient size to permit the placing of the full width and length of the footing. The Engineer may order, in writing, such changes in dimensions or footing elevations as may be necessary to secure a satisfactory foundation.

Structural excavation for pipe culverts and underdrains shall be accomplished in accordance with the sections covering pipe culverts and underdrains.

All foundation excavation adjacent to the tracks of any railroad shall be shored, braced and supported as required by the railroad company or the

212.4

Engineer, and the Contractor will be held responsible for securing such information and complying. Plans for this shoring, bracing, and supporting shall be submitted to and shall meet with the approval of the Chief Engineer of the railway company before starting excavation. Bracing, shoring, and supporting excavation at structures other than railroad tracks shall meet with the approval of the Engineer.

212.4-DISPOSAL OF MATERIAL:

The excavated material, unless otherwise directed by the Engineer, shall be utilized for backfill or embankments. Surplus material shall be disposed of in such a manner that the efficiency or appearance of the structure shall not be impaired, and the stream not muddied or obstructed.

212.5-COFFERDAMS:

The term cofferdam designates any barrier system that provides a dry, watertight as practicable, area for excavation, inspection or placing concrete. Subject to other requirements in these Specifications, a cofferdam may be constructed of materials including sheet piling, wood, sand bags, earth embankment, etc. or a combination of any of these.

Cofferdams shall, in general, be carried well below the bottom of the footings and shall be well braced and as watertight as practicable. The interior dimensions of cofferdams shall be sufficient to give adequate clearance for the construction of forms and to permit pumping from outside of the forms. When sandy or porous material is encountered in the foundation which renders it impracticable to dewater the excavation before placing masonry, the bottom may be sealed with concrete placed by the tremie method, after which the remainder of the work shall be carried on in the dry.

No bracing of any kind shall be left in cofferdams in such a way as to extend in to the substructure masonry without the written permission of the Engineer.

Cofferdams shall be removed by the Contractor upon completion of the substructure.

212.6-PUMPING:

Pumping from the interior of any foundation enclosure shall be done in such a manner as to preclude the possibility of the passage of water through fresh concrete. No pumping will be permitted during the placing of concrete, or for a period of at least 24 hours, unless it is done with a suitable pump separated from the concrete by a water-tight wall.

212.7-INSPECTION:

After an excavation is completed, the Contractor shall notify the Engineer, and no footing, pipe, or other structure shall be placed until the Engineer has approved the depth of excavation, the character of foundation material encountered, and has obtained the necessary foundation measurements.

212.8-PREPARATION OF FOUNDATIONS:

Rock or other hard foundation material shall be free from all loose material, cleaned and cut to a firm surface, stepped or serrated as directed by the Engineer. All seams shall be cleaned and filled with concrete, mortar, or grout. Excavation in rock shall be made to the neat lines of the footing as nearly as practicable and the concrete placed against the rock without forming.

When masonry is to rest on an excavated surface other than rock, special care shall be taken not to disturb the bearing surface, and the final removal of foundation material shall not be made until just before masonry is to be placed.

212.9-DRAINAGE:

Adequate drainage for the backs of retaining walls, abutments and wing walls shall be provided by outlet tile or pipe drains extending through the walls at the ground line or as indicated on the Plans. In case the outlet end of these drains is below the ground line or would be covered by fill material, the drains shall connect to pipe outlets or be extended to the toe of the slope of the fill. When drain pipes are not called for or indicated on the Plans for these drains, the drains shall be constructed to a minimum sectional area of 24 by 24 in. (600 by 600 mm) and shall consist of sand, crushed stone, or gravel. Excavation and backfilling shall conform to the requirements of this Specification.

When underdrains with pipe are shown or indicated on the Plans and there are bid items for the same, they shall conform to the applicable requirements of 606.

The back of retaining walls, abutments and wing walls shall have porous drains, 1 ft. (300 mm) thick or as shown on the Plans, placed on the back side of the walls and abutments for the entire length and height of the same, beginning at the elevation of the outlet drains.

212.10-BACKFILLING:

Backfill material shall be suitable random material, controlled low strength material or select backfill material. Random material shall be free from particles larger than 3 inches (75 mm), frozen lumps, wood, or other extraneous material. Unless otherwise specified in the plans, any of the types of controlled low strength material may be used and shall be an alternative to random material at the contractor's option. Select backfill material shall be in accordance with 212. Controlled low strength material shall be in accordance with 219.

All spaces excavated and not occupied by abutments, piers, or other structures shall be backfilled to the surface of the surrounding ground. All backfill, except controlled low strength material, shall be thoroughly compacted by rolling or tamping as prescribed below and the top surface neatly graded.

Random material and select backfill material behind and around abutments, wingwalls, piers, bents, pedestals and all other structures, including those inaccessible to a roller, shall be compacted in layers not to exceed 4 inches (100 mm) after compaction. Controlled low strength material shall be placed according to 219.

The quality control and acceptance of controlled low strength material shall

212.11

be in accordance with 219.

The quality control and acceptance for compaction of random material shall be in accordance with applicable sections of 207 and 716. Five density tests shall be performed for quality control. The target percentage of dry density shall be 95%.

Special precautions shall be taken to prevent any wedging action against the masonry and the slope bounding the excavation for abutments and walls. Such condition shall be prevented by stepping or serrating to destroy wedge action. Jetting of fill behind retaining walls, abutments, and wing walls will not be permitted. Backfill over and around abutments, culverts, arches, and columns shall be brought up uniformly to avoid bending or distortional stresses in the structures, shall be made as soon as practicable after forms are removed, and shall be sloped to drain. The 4 in. (100 mm) layer requirement and compaction for backfill in water will be waived. The testing of backfill compaction, at piers or other structures, which will not become part of an embankment or highway pavement or shoulder area will be waived.

Select backfill material shall be placed behind abutments, wingwalls retaining walls, and box culverts to the dimensions shown on the Plans. The material shall be placed in horizontal layers not to exceed 4 inches (100 mm) compacted.

The quality control testing and acceptance for the select backfill material shall be in accordance with applicable sections of 207 and 716.

A lot shall normally consist of the quantity of backfill material required to fill behind and around abutments, wingwalls, piers, bents, pedestals and all other structures as approved by the Engineer.

The select backfill materials shall be tested according to MP 700.00.24. Five density tests shall be performed for quality control. The target percentage of dry density shall be 95%.

In all areas where select backfill will contact random material, engineering fabric shall be placed in accordance with the last paragraph of 207.9.

212.11-METHOD OF MEASUREMENT:

The quantity of work done for Item 212001-*, "Structure Excavation", Item 212002-*, "Wet Excavation", Item 212003-*, "Rock Excavation" and Item 212005-*, "Select Material for Backfilling", will be the number of cubic yards (meters) established in the Proposal. Any additional work beyond the scope of the Plans, authorized by the Engineer, will be measured in cubic yards (meters) for the excavated material removed or Select Backfill in place and paid for in accordance with the Subsection and 109.2. Measurement for "Structure Excavation" and "Wet Excavation" will be limited to the volume bounded by vertical planes 18 in. (450 mm) outside the neat line of footings and parallel thereto; "Rock Excavation" will be limited to the volume bounded by the neat lines of the footings.

When an increase in depth of foundation has been ordered by the Engineer, the excavation for the first 5 ft. (1.5 meters) or fraction thereof below the elevation shown on the Plans will be paid at the unit bid price. The Engineer

may require the Contractor to make excavation to a depth greater than 5 ft. (1.5 meters) below Plan elevation in accordance with 104.3.

All excavation performed under this section will be classified as "Structure Excavation", except as stated. When the Plans specify "Rock Excavation", all material encountered in the excavation requiring blasting for its removal and all boulders greater the ½ cu. Yd. (0.4 cubic meters) in volume will be considered as "Rock Excavation" and be paid for as such. When a quantity of "Wet Excavation" is shown on the Plans, and a normal pool elevation is indicated, excavation below the normal pool elevation, except that classified as "Rock Excavation", will be considered "Wet Excavation" and will be measured below normal pool elevation from the stream bed to the bottom of the footings.

The cost of bracing, shoring and supporting excavation adjacent to railroad tracks and other structures shall be included in the unit price bid for "Structure Excavation", "Wet Excavation", or "Rock Excavation".

Structural excavation for old structures requiring removal will be limited to the outside dimensions of the structure.

Excavation for the drains specified in 212.9 will be paid as Item 212001-*, "Structure Excavation", and the cost of backfilling drains with sand, crushed stone or gravel shall be included in the price bid for "Structure Excavation".

Clearing of right-of-way within the construction limits of piers, abutments, retaining walls, etc., and backfilling to the level of the original ground will be included in unit prices bid for "Structure Excavation", except that select material for backfilling will be paid for under Item 212005-*. If backfill above original ground is required, material for the backfill will be measured and paid for as prescribed under 207 or 211.

The measurement and payment for engineering fabric will be included in the unit price bid for "Select Material for Backfilling".

Item 212004-* "Cofferdams", will be measured and paid for each unit complete in place, including their removal, and shall include all labor, materials, and equipment incidental to the construction, pumping and removal. Progress payments, determined by the Engineer, may be made.

212.12-BASIS OF PAYMENT:

The quantities, measured as provided above, will be paid for at the contract unit price bid for these items, which prices and payments shall be full compensation for furnishing all materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work, and also including cost of cofferdams and their removal, except when a separate bid item is provided for Item 212004-*, "Cofferdams".

212.13-PAY ITEMS:

213 THROUGH 216-BLANK

SECTION 217 SPECIAL ROCK FILL

217.1-DESCRIPTION:

This work shall consist of furnishing and placing at the foot of embankments, inside or outside the neat line, where called for on the Plans or as directed by the Engineer, durable rock in accordance with the Specifications and in reasonably close conformity to the lines, grades, dimension and sections shown on the Plans

217.2-MATERIALS:

The rock for special rock fill shall meet the requirements specified in [704.5](#).

217.3-CONSTRUCTION METHODS:

Where possible, the material shall be handled as ordinary rock embankment as prescribed in [207.7.3](#); however, if the location for the special rock fill is not accessible to ordinary placing, the material may be placed by other methods.

Foundation trenches and other necessary excavations shall be excavated by the Contractor, in accordance with the applicable provision of [212](#), and approved by the Engineer before the placing of the special rock fill is begun.

Unless otherwise shown on the Plans or directed by the Engineer, the rock fill shall extend approximately 2 ft. (600 mm) below the bed of the stream.

217.4-METHOD OF MEASUREMENT:

The quantity of work done will be measured in cubic yards (meters) of "Special Rock Fill", complete in place and accepted, determined by the method of average end areas.

217.5-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for this item, which price and payment shall be full compensation for furnishing all the material and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, and incidentals necessary to complete the work.

217.6-PAY ITEM:

ITEM	DESCRIPTION	UNIT
217001-*	SPECIAL ROCK FILL	CUBIC YARD (METER)

*Sequence number

SECTION 218 SLOPE AND FOUNDATION PROTECTION

218.1-DESCRIPTION:

This work shall consist of the construction of revetments of stone or concrete, with or without engineering fabric, to prevent erosion of slopes or banks, or to protect foundations, at places indicated on the Plans or where designated by the Engineer, all in accordance with these Specifications and in reasonable close conformity with the lines, grades, dimension, and cross sections shown on the Plans.

218.2-MATERIALS:

Materials shall meet the requirements specified in the following Sub-sections of Division 700:

MATERIALS	SUBSECTION
Cement for Grout	701.1 or 701.3
Sand for Grout	702.1.1 through 702.1.5 and 702.6, or 702.2
Stone for Riprap	704.2
Stone for Gabions	704.3
Gabions	715.23
Reinforcement	709.3, 709.4
Shot Rock	704.8
Engineering Fabric for Erosion Control	715.11

The stone for crushed rock slope protection shall meet the requirements of 704.6, Class 7, except 704.6.3. Acceptance will be on the basis of the producers written certification the material meets the requirements. The certification for Class 7 material shall include a description of the crushing operation indicating the screens used. An alternate to this gradation shall be AASHTO size No. 1. Certified test data from the producer showing the AASHTO No. 1 material meets the gradation requirements of 703.4, when tested from samples obtained at a minimum frequency of one sample per half day of stockpiling, and does not exceed a weighted loss of 30 percent when subjected to five cycles of the Sodium Sulfate Soundness Test, ASTM C 88, will be acceptable.

Stone for foundation protection shall conform to the requirements of riprap

218.3

stone, except for size and shape.

CONSTRUCTION METHODS

218.3-SLOPE PROTECTION:

218.3.1-General: The slopes to be revetted shall reasonably conform to the lines, grades, dimensions, and cross sections as shown on the Plans, unless otherwise directed.

The placing of riprap or grouted riprap shall start in a trench, the invert of which is parallel to and 2 ft. (600 mm) below the toe of the slope, and the trench shall be 2 ft. (600 mm) in width. The construction shall progress from the invert of the trench up the slope to conform to the requirements specified.

Slope protection with crushed rock, concrete slabs, or precast concrete blocks shall start at a concrete bottom sill, shall be included within side sills, and shall progress upward to the berm in front of the abutment. The design and dimensions of the sills shall be as shown on the Plans. The area of the sills shall be considered a part of the area of the slope protection. The concrete sills may be precast or cast-in-place and shall be placed in a trench excavated to receive them. Concrete used in the sills shall meet the requirements specified in [218.3.6.2](#).

Construction equipment shall not operate directly on engineering fabric. The fabric shall be protected from detrimental contamination by surface runoff. Any fabric so contaminated shall be removed and replaced with uncontaminated fabric.

Weep holes shall be provided as directed by the Engineer when grouted riprap, concrete slab, or concrete block slope protection is specified.

218.3.2-Riprap: Riprap shall be composed of stones having the dimensions specified, each stone being firmly bedded on the slope in such a manner that it abuts against other stones to form a layer, the interstices of which are filled with suitably sized spalls. The dimensions of each stone in a plane parallel to the plane of the slope shall be not less than 3 in. by 12 in. (75 by 300 mm) Unless otherwise specified, the longer dimension shall be placed horizontally. The surface of each stone shall not vary more than 3 inches (75 mm) from the specified surface plane. Abutting stones shall have depths not different by more than 1-½ in. (40 mm). The average depth of the stone placed in the riprap shall be not less than the specified depth of the riprap. The first row of stone shall be firmly bedded on the invert of the trench so as to form a firm foundation, and the construction shall progress up the slope by fitting additional and abutting stones with well broken joints and in such a manner that the most compact mass of riprap is developed.

218.3.3-Grouted Riprap: Grouted riprap shall be as defined in [218.3.2](#) with the interstices filled with spalls and grouted with cement grout. The grout filler shall be composed of a mixture of one part portland cement and three parts sand, mixed with water to produce a workable consistency. The amount

of water shall be that designated by the Engineer. The stone shall be thoroughly wet immediately before grout is applied. As soon as the grout is deposited on the surface, it shall be thoroughly worked into the joints. The stones shall then be brushed so that their top surfaces are exposed.

Grouted riprap shall be cured in accordance with any of the methods specified in 501.15, with a blanket of earth kept wet for 72 hours, or by sprinkling with a fine spray of water every two hours during the day-light hours for a period of three days.

218.3.4-Gabions: Gabions, consisting of galvanized wire mesh baskets filled with rocks, shall conform to these Specifications and the dimensions shown on the Plans.

Assembling of the gabion units and their filling with rock shall be carried out as directed by the Engineer. The visible faces of the baskets shall be hand placed to insure an attractive appearance, and the core of the baskets may be filled by mechanical equipment.

218.3.5-Crushed Rock Slope Protection: The thickness of crushed rock slope protection shall be as indicated on the Plans. The rock shall be raked in place to obtain a reasonably smooth and continuous surface conforming to the thickness and slope lines indicated on the Plans.

218.3.6-Concrete Slope Protection:

218.3.6.1-General: Concrete slope protection may be by cast-in-place concrete slab or precast concrete blocks; only one method shall be used at any one bridge.

218.3.6.2-Cast-in-Place Concrete Slab: Concrete slabs shall be not less than 6 inches (150 mm) thick, shall be reinforced with Type B Fabric, and shall conform to the applicable provisions of 501, unless otherwise indicated. Transit mix concrete will be permitted. A wood float finish will be acceptable.

Construction joints shall be provided at intervals of 10 ft. (3 meters) in both directions. Class B Concrete, meeting the requirements of 601 may be used in lieu of the concrete provided above.

218.3.6.3-Precast Concrete Blocks: Precast concrete blocks shall conform to the applicable provisions of 601 and shall be made of Class B concrete, reinforced with Type B fabric. The blocks shall be 3 by 1½ ft. and 4 in (1000 by 500 by 100 mm) thick. The longer dimension shall be placed on a horizontal plane. The blocks shall be firmly embedded against the slope and against adjoining blocks, with the ends in contact. The finished surface shall present an even, tight surface, reasonably true to line, grade, and section.

218.3.7-Engineering Fabric:

218.3.7

218.3.7.1-Fabric Placement: The area in which the fabric is to be installed shall be prepared in a relatively smooth state, free of sharp protrusions, depressions and debris. The machine direction of the fabric shall generally be placed parallel with the direction of major water flow, i.e., parallel to the stream or as authorized by the Engineer. The fabric shall be placed in a relatively loose and unstretched condition such that the fabric and underlying material deforms slightly under riprap weight when placed. Fastener pins shall be placed to prevent displacement of the fabric.

The fabric shall be field sewn as described in 715.11.3 or overlapped. When the overlapping technique is used, an overlap of 3 ft. (900 mm) shall be maintained so the upgrade fabric shall always be lapped over the downgrade fabric.

218.3.7.2-Cover Material Placement: Extreme care shall be exercised in placing cover material over the fabric, especially when riprap is used. Under no circumstances shall heavy angular stone, such as riprap, be dropped on the fabric from more than 1 ft. (300 mm) in height. A cushioning layer of sand or gravel may be placed between the fabric and riprap, providing this material does not inhibit free drainage of the slope.

All cover material shall be placed from downslope to upslope in such a manner as to prevent slippage of the cover material off the fabric.

218.4-FOUNDATION PROTECTION:

The area around piers, abutments or other foundations shall be excavated to a depth and width indicated on the Plans, or as otherwise directed.

Stone for foundation protection shall be largely equidimensional, angular, and generally ranging in size between one cubic foot (300 cubic millimeters) and one cubic yard (meter). The stone need not be placed, but may be dumped from trucks or bulldozed in place. The stone shall be placed where indicated on the Plans or as directed by the Engineer.

218.5-METHOD OF MEASUREMENT:

Except for "Shot Rock" which will be measured in tons (Mg), the quantity of work done under Slope Protection will be measured in cubic yards (meters) of "Riprap", "Grouted Riprap", or "Gabions", and in square yards (meters) of "Crushed Rock Slope Protection", "Concrete Slope Protection" or "Fabric for Erosion Control", excluding overlaps.

The number of tons (Mg) of "Shot Rock" shall be determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail; by actual measured displacement of barges certified by the producer when water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved truck scale, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that

are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions. The Division may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time, date, truck identification and project number. Provisions shall be made for constant zero compensation and further provision shall be made so that the scales may not be manually manipulated during the printing process.

The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

Each truck shall be weighed empty prior to each load.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales or from the digital printout of the weights, is correct.

Area dimensions will be based on slope measurement; concrete sills will be included in the area measurement for crushed rock or concrete slope protection. Volumes may be determined by verified plan dimensions or from measurements of the completed work, as authorized by the Engineer. The quantity of work done under "Foundation Protection" will be measured incubic yards (meters), actually produced and incorporated in the work, determined in its original position from cross sections by the method of average end areas, unless otherwise authorized by the Engineer.

218.6-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for these items, which prices and payments shall be full compensation for excavating and preparing the embankment or slope, footing and sill trench; furnishing all the materials, including steel reinforcement; and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

SECTION 219

CONTROLLED LOW-STRENGTH MATERIAL

219.1-DESCRIPTION:

A Controlled Low Strength Material (CLSM) is a non-compacted, cementitious material used primarily as a backfill in lieu of a compacted material.

This work shall consist of furnishing and placing CLSM as a backfill material in accordance with these Specifications and in reasonably close conformity with the lines, grades, thicknesses and cross sections shown on the Plans or established by the Engineer.

219.2-MATERIALS:

Materials shall meet the requirements specified in the following Subsections of section 700.

Material**Subsection**

Flyash:	707.4.1 (except with a maximum loss on ignition of 12%)
Portland Cement:	701.1 or 701.3
Aggregate:	
1. Bottom Ash:	703.3.3 (except with the following gradation and a maximum loss on ignition of 12%):

Sieve Size

¾ inch (19 mm)
 3/8 inch (9.5 mm)
 #100 (150 µm)

Percent Passing by Weight:

95%
 85-100%
 0 – 25%

2. Fine Aggregate: 702.1.1 – 702.1.5 with the following gradation:

Sieve Size	Percent Passing by Weight:
3/8 inch (9.5 mm)	100%
#200 (150 μ m)	0-10%

Water: 715.7

Admixtures: 707

219.3-PROPERTIES:

<u>Type</u>	<u>28 Day Compressive Strength</u>
A	50 psi min./150 psi max. (345 kPa min./1035 kPa max.)
B	50 psi min. (345 kPa)
C	1000 psi min. (6900 kPa)
pH	5.0 – 13.0

Flow - A minimum spread of 6 inches (150 mm) determined from a representative sample placed, without tamping, in an open ended 3 inches (75 mm) diameter by 6 inch (150 mm) high cylinder placed on a flat non-absorbent surface and slowly removed.

219.4-CONSTRUCTION METHODS:

219.4.1-Proportioning: Prior to the start of construction, the Contractor shall design and submit to the Engineer for approval the proportions of materials, including admixtures, to be used which will result in a workable, CLSM mixture having the desired properties.

A mix design shall be required for each type of CLSM to be used in the work. The mix design shall be accompanied by a statement giving the source of materials and certified test data demonstrating the adequacy of the mix design.

The results of the mix design testing shall include a listing of the components used in the mix, the results of unconfined compressive strength tests, pH, and flow.

The mix shall have a consistency that will allow the material to fill all voids during placement without vibration or other consolidation methods.

219.4.2 – Testing: For every 100 cubic yards (75 cubic meters) or less of material placed, prepare cylindrical samples for unconfined compression testing

219.4.3

according to AASHTO T-22 and determine the flow. Field cure the samples in accordance with AASHTO T-23. Test the three cylinders at 28-day cure. The average compressive strength at 28 days shall meet the specification requirements. Material not meeting the minimum compressive strength at 28 days shall be removed at the Contractor's expense. Type A material that exceeds the maximum compressive strength shall be evaluated by the Division.

Report all test results, in written form, to the Engineer within 24 hours after completion of each test.

Contractor's Quality Control: Quality control of the CLSM is the responsibility of the Contractor. The Contractor shall maintain equipment and certified Portland cement concrete inspector(s) who shall maintain equipment and direct all field inspection, sampling and testing necessary to determine the magnitude of the various properties of the CLSM governed by the Specifications and shall maintain these properties within the limits of this Specification. A Quality Control Plan prepared according to MP 601.03.50 shall be submitted to the Engineer at the pre-construction conference.

Acceptance Testing: Acceptance sampling and testing of CLSM is the responsibility of the Division.

Quality control sampling and testing performed by the Contractor may be used by the Division for acceptance.

219.4.3 – Equipment and Tools: Equipment shall be according to 601.5.

219.4.4 – Site Preparation: The Contractor shall provide the necessary barriers to confine the CLSM. Pipe culverts and any other items to be backfilled that could move or float during backfilling, shall be secured by the Contractor to prevent movement.

219.4.5 – Mixing: The mixing shall be in accordance with 601.7 except that CLSM shall be delivered in a truck mixer. Mixing and delivery is also permitted using volumetric batching and mixing equipment in accordance with AASHTO M241. Volumetric mixers shall be properly calibrated and shall sufficiently mix the materials to produce a uniform product. The limitation on the total number of drum revolutions is waived. Sufficient drum revolutions shall be used just prior to discharge to insure a homogeneous slurry.

219.4.6 – Placement: The drop height for the CLSM shall be limited to the minimum necessary by using chutes or other devices.

CLSM shall be brought up evenly by moving the discharge points or by spreading the backfill manually. For backfilling around pipes, the backfill shall be placed evenly on both sides of the trench to avoid overstressing the pipe.

The lift thickness shall be limited to that shown on the plans or as directed by the Engineer to avoid overstressing the pipe, forms, structures or to avoid floating the pipe. Prior to placement of successive lifts, the CLSM shall be allowed to cure until it is self-supporting.

CLSM shall not be finished between lifts. The top of a lift shall be cleaned,

if necessary, to insure bonding with the next lift.

219.5-PAY ITEMS:

220 THROUGH 227-BLANK

SECTION 228 SUBGRADE PREPARATION

228.1-DESCRIPTION:

This work shall consist of preparing the subgrade for the placing of base or subbase in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions and cross section shown on the Plans.

This item is intended to be used for any project or portion thereof where the Contract is for paving without grading.

228.2-MATERIALS:

Not specified.

228.3-CONSTRUCTION METHODS:

All work shall be performed in accordance with the applicable provisions of 207 and 211.

Subgrade preparation shall include the entire width of the subgrade. Excavation material shall be used to bring eroded areas to the plan cross section. If sufficient material is not obtained from the subgrade preparation, additional suitable material shall be obtained by the Contractor.

228.4-METHOD OF MEASUREMENT:

The quantity of work done will be measured in square yards (meters) of "Subgrade Preparation" as determined from lines and dimensions shown on the Plans.

When borrow is necessary to complete the subgrade preparation item, it will be measured and paid for under the provisions of 211.

228.5-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price for the item listed below, which price and payment shall be full compensation for doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, and incidentals necessary to complete the work.

228.6

SECTION 229

SHOULDERS AND DITCHES

229.1-DESCRIPTION:

This work shall consist of trimming, sloping, shaping, grading, subgrading, scarifying, and compacting existing shoulders and ditches including inlets and outlets to pipe culverts, and constructing new shoulders and ditches where necessary, in accordance with these Specifications and in reasonably close conformity with the lines, grades, and cross sections shown on the Plans or established by the Engineer.

229.2-MATERIALS:

Not Specified.

CONSTRUCTION METHODS

229.3-SHOULDERS:

Shoulders shall be formed and compacted as soon as possible after the surfacing item is completed, or as directed by the Engineer, to the grade and cross section shown on the Plans. Needed material shall be furnished by the Contractor.

The character and operation of the equipment shall be such that the pavement will not be damaged. Pavement damage by these operations shall be repaired, or removed and replaced by the Contractor to the satisfaction of the Engineer, without extra compensation. Upon evidence of such damage, the Engineer may require the discontinuance of the methods used and the work to be done by other methods. The final dressing shall be by hand methods if so required. Shoulders shall be constructed of suitable material obtained on the project or of selected material as designated on the Plans. Surplus or unsuitable material shall be removed and disposed of as directed, which shall include shaping shoulders under existing guardrail to edge of the fill.

The entire shoulder area shall be uniformly compacted by rollers, mechanical tampers, or hand methods, and finally dressed to true section.

229.4-DITCHES:

Existing ditches shall be trimmed, sloped, and cleaned, and inlets and outlets to existing structures opened and shaped to a uniform grade as directed by the Engineer.

229.5-METHOD OF MEASUREMENT:

The quantity of work done will be the number of linear miles (kilometers), or portion thereof, as established in the Proposal. No deductions for lengths will be made for work not performed on any side of the roadway or portions thereof. Any additional work beyond the scope of the original Plans but authorized by the Engineer will be measured in linear miles (kilometers) along the centerline of the roadway and paid at the unit bid price for this item.

229.6-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for this item, which price and payment shall be full compensation for doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, material, and incidentals necessary to complete the work.

Stabilizing material when specified on the Plans will be measured and paid for separately.

229.7-PAY ITEM:

230 THROUGH 239-BLANK

SECTION 240 CLEANING CULVERTS, INLETS AND MANHOLES

240.1-DESCRIPTION:

This work shall consist of complete removal of obstructions and thorough cleaning of trash, dirt and other debris from culverts, and their appurtenant structures; e.g., inlets, manholes, etc.; when appropriate or so designated, in a manner determined by the Contractor and acceptable to the Engineer.

240.2-MATERIALS:

Not Specified.

240.3-CONSTRUCTION METHODS:

Methods employed and equipment utilized by the Contractor for cleaning culverts and their appurtenant structures; e.g., inlets, manholes, etc.; shall be acceptable to the Engineer.

Cleaning procedures employed shall insure that the removal and disposal of obstructions, trash, and debris be accomplished such that the existing structure being cleaned is not damaged and deposition on, or damage to, adjacent and downstream property will be avoided. Likewise, the cleaning methods shall minimize as much as practicable, pollution and sedimentation of

240.4

receiving streams, rivers, or other bodies of water and clogging of, or damage to, downstream drainage structures.

240.4-METHOD OF MEASUREMENT:

"Cleaning Culverts" will be measured by the linear foot (meter) of each size of culvert cleaned, the measurement being considered along the centerline of each culvert. The lengths for branch connections, tees, wyes and elbows will be considered along their centerlines and those values included in the total lengths of the appropriate culvert. Measured values for culverts with sloped or skewed ends will be the length along the invert. The portion of culverts extending through to the inside face of headwalls, wingwalls, manholes, inlets, boxes or other structures shall be included in the measurement.

"Cleaning Inlets" and "Cleaning Manholes" will be measured by the unit and will be the number of such structures that are actually cleaned.

240.5-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items below, which prices and payments shall be full compensation for doing the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

Payment for any maintenance of traffic necessary in connection with the work shall be included in the appropriate 636 items of the specifications.

240.6-PAY ITEMS:

DIVISION 300

BASES

301 THROUGH 306 – BLANK

SECTION 307

CRUSHED AGGREGATE BASE COURSE

307.1-DESCRIPTION:

This work shall consist of furnishing, spreading, and compacting one or more courses of crushed aggregate on a prepared surface in accordance with these Specifications and in reasonably close conformity with the lines, grades, thicknesses, and typical cross sections shown on the Plans or established by the Engineer.

The work will be accepted in accordance with these Specifications and the applicable requirements of 105, 106, and 109.

307.2-MATERIALS:

The crushed aggregate base course shall be composed of materials meeting the requirements of 704.6 for the class shown on the Plans except that 704.6.3 shall not apply.

307.2.1-Quality Control Testing: Quality control of the crushed aggregate base course is the responsibility of the Contractor as specified in 106.1.

The Contractor shall maintain equipment and qualified personnel to perform all sampling and testing necessary to determine the magnitude of the various properties of the material governed by the Specifications and shall maintain these properties within the limits of the Specifications.

The Contractor shall design a quality control plan detailing the methods by which the quality control program will be conducted. This plan, prepared in accordance with the guidelines set forth in the appropriate portions of MP 307.00.50 and MP 717.04.21, shall be submitted to the Engineer at the preconstruction conference. The work shall not begin until the plan is reviewed for conformance with the contract documents.

307.2.2-Acceptance Testing: Acceptance sampling and testing of crushed aggregate base course is the responsibility of the Division, except for furnishing the necessary materials. Quality control sampling and testing performed by the Contractor may be used by the Division for acceptance.

307.2.3-Sampling and Testing: Frequency of sampling and testing shall be in accordance with the Contractor's quality control plan. The minimum frequencies shall be as indicated in applicable portions of MP 307.00.50. Crushed aggregate shall be sampled in accordance with MP 700.00.06, Aggregate Sampling Procedures.

307.2.4

307.2.4-Acceptance Procedure: Material conforming to the specification requirements will be accepted at full contract price. Material failing to comply with the quality requirements of Table 704.6.2 shall not be incorporated into the work.

Acceptance of crushed aggregate base course for compaction and for gradation shall be in accordance with appropriate portions of 307.2.4.1.

307.2.4.1-Acceptance Plan: Acceptance for compaction shall be on a lot by lot basis. A lot shall consist of a single layer of not more than 2,000 linear ft. (600 meters) per width being placed. A lot shall be divided into five approximately equal sized sublots. One nuclear moisture and density measurement in accordance with applicable portions of 717 shall be made at a random location within each of the five sublots. The random locations shall be determined in accordance with MP 712.21.26. If the result of five density tests on a lot indicates that at least 80 percent of the material, in accordance with 106.3.1 (West Virginia AP-A), has been compacted to the specified target percentage of dry density, the lot will be accepted. If less than 80 percent has been compacted to the specified target percentage of dry density, no additional material shall be placed on that layer until it has been reworked to meet the specified requirements. Reworking and retesting shall be at the expense of the Contractor. When the Division performs the testing in the evaluation of reworked lots, the testing will be at the expense of the Contractor at the unit cost specified in 109.2.2.

Acceptance for gradation shall be on the basis of test results on consecutive random samples from a lot. A lot shall be considered the quantity of material represented by an average test value, not to exceed five sublots. Generally at the beginning of the project, the average shall be started on the second sample in accordance with MP 300.00.51. A subplot is the quantity of material represented by a single gradation test. In the case where only one sample is taken, this subplot shall be considered the lot. The material shall be sampled and tested in accordance with 307.2.3. The gradation test results shall be plotted on a control chart in accordance with MP 300.00.51. When the average, or when the most recent three consecutive individual test values fall outside the limits of Table 704.6.2, the lot of material represented will be considered nonconforming to the extent that the last of its sublots is nonconforming. When this occurs, the last subplot shall have its price adjusted in accordance with Table 307.9.1. In the case where the average is nonconforming and the last subplot contained is conforming, then there would be no price adjustment. In no event, however, shall a subplot of material have its price adjusted more than once, and the first adjustment which is determined shall apply.

307.2.4.2-Degree of Nonconformance: When a subplot of material is to have its price adjusted, the percentage point difference between the nonconforming

test value and the specification limit shall be determined for each sieve size determined to be nonconforming, and this value shall be multiplied by its appropriate multiplication factor as set forth in Table 307.2.4.2 to determine the degree of nonconformance on that sieve.

TABLE 307.2.4.2

NONCONFORMING SIEVE SIZE	MULTIPLICATION FACTOR
2 in. (50 mm)	1.0
1 ½ in. (37.5 mm)	1.0
¾ in. (19 mm)	1.0
No. 4 (4.75 mm)	1.0
No. 40 (425 µm)	1.5
No. 100 (150 µm)	2.0
No. 200 (75 µm)	2.5

The total measure of nonconformance of an individual subplot is the sum of all nonconformances on the various sieve sizes of that subplot.

When the total degree of nonconformance has been established and it is 12.0 or less, the material will be paid for at an adjusted contract price as specified in Table 307.9.1.

When the degree of nonconformance is greater than 12.0, the nonconforming subplot shall be resolved on an individual basis, requiring a special investigation by the Engineer to determine the appropriate course of action to be followed.

Pending resolution of the matter, additional lifts of base or pavement shall not be placed over the nonconforming material.

CONSTRUCTION METHODS

307.3-EQUIPMENT:

Any machine, combination of machines, or equipment which will handle the material without undue segregation and produce the completed base course meeting these Specifications for handling, spreading, moistening, mixing and compacting may be used when approved by the Engineer.

307.4-PLACING:

Prior to the placing of any base course material on the subgrade, the subgrade shall meet the applicable requirements of 207.9 or 228. The profile grade of the subgrade shall be such that the specified thickness of the base course may be obtained. No base shall be placed when the subgrade is frozen or when it is sufficiently wet that its surface can be marred by construction equipment.

The base course shall be placed and shaped on the prepared surface in layers to achieve the compacted thickness shown on the Plans. When more than one

307.5

layer is required, each layer shall be shaped and compacted to the required density before the succeeding layer is placed. Each layer shall be kept at least 500 ft. (150 meters) ahead of the succeeding layer. Tailgating will not be permitted. If power graders are used for spreading, the material shall be placed in windrows and uniformly and thoroughly mixed prior to final spreading and compaction.

307.5-COMPACTING:

Each layer shall be compacted. The moisture content shall be maintained at a level sufficient to facilitate compaction. Required density and testing shall be in accordance with the provisions of the appropriate portions of 717. The surface of each layer shall be maintained during the compaction operations in such a manner that a uniform texture is produced and the aggregates firmly keyed. The surface of the top layer of the base course shall be carefully trued by blading if necessary.

307.6-TOLERANCE:

307.6.1-Surface Tolerance: The completed surface shall not vary more than $\frac{3}{8}$ in. (10 mm) above or below Plan grade, nor more than $\frac{3}{8}$ in. (10 mm) from a straightedge 10 ft. (3.048 m) long applied parallel to the centerline of the pavement. Deviations shall be corrected by scarifying, adding additional approved aggregate if necessary, reshaping, and recompacting.

307.6.2-Thickness Tolerance: The base course shall be checked for proper thickness after final compaction. The Contractor shall refill all test holes with approved base course material and adequately recompact the material.

Any deficiency in total thickness of the base course in excess of $\frac{1}{2}$ in. (13 mm) shall be corrected.

307.7-MAINTENANCE:

The surface of the completed base shall be protected against the loss of fine material by the addition of moisture when necessary, and it shall be maintained in a satisfactory and smooth condition until such time that it is surfaced or finally accepted.

307.8-METHOD OF MEASUREMENT:

The quantity of work done will be the number of cubic yards (meters) as established in the Proposal. Any additional work beyond the scope of the original Plans but authorized by the Engineer will be measured in cubic yards (meters) in place and paid for at the unit bid price for this item, subject to the provisions of 104.2 and 109.2.

Base course constructed outside the lines, dimensions, and cross sections shown on the Plans or designated will not be measured for payment.

307.9-BASIS OF PAYMENT:

The accepted quantities will be paid for at the respective contract unit price

as specified for the pay items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including water, labor, tools, equipment, supplies, and incidentals necessary to complete the work.

307.9.1-Price Adjustment: Aggregates not conforming with the gradation requirements as described in 307.2.4.1 will be paid for at the adjusted contract price based on the degree of nonconformance as specified in Table 307.9.1.

TABLE 307.9.1

ADJUSTMENT OF CONTRACT PRICE FOR
GRADATION NOT WITHIN SPECIFICATIONS

DEGREE OF NONCONFORMANCE	PERCENT OF CONTRACT PRICE TO BE REDUCED
1.0 to 3.0	2
3.1 to 5.0	4
5.1 to 8.0	7
8.1 to 12.0	11
Greater than 12.0	*

* The Division will make a special evaluation of the material and determine the appropriate action.

SECTION 308

TRAFFIC BOUND BASE COURSE OR SHOULDER

308.1-DESCRIPTION:

This work shall consist of scarifying and reshaping the existing surface and reconditioning the whole by the addition of approved materials as required, in accordance with these Specifications and in reasonably close conformity with the lines, grades, thicknesses, and typical cross sections shown on the Plans or established by the Engineer.

308.2-MATERIALS:

Traffic bound base course or shoulder shall be composed of materials meeting the requirements of 704.6 for the class shown on the Plans except that 704.6.3 shall not apply.

308.2.1-Quality Control Testing: Quality control is the responsibility of the Contractor as specified in 106.1.

The Contractor shall maintain equipment and qualified personnel to perform all sampling and testing necessary to determine the magnitude of the various properties of the material governed by the Specifications and shall maintain these properties within the limits of the Specifications.

The Contractor shall design a quality control plan for detailing the methods by which the quality control program will be conducted. This plan, prepared in accordance with the guidelines set forth in the appropriate portions of MP 307.00.50 and MP 717.04.21, shall be submitted to the Engineer at the preconstruction conference. The work shall not begin until the plan is reviewed for conformance with the contract documents.

308.2.2-Acceptance Testing: Acceptance sampling and testing is the responsibility of the Division, except for furnishing the necessary materials. Quality control sampling and testing performed by the Contractor may be used by the Division for acceptance.

308.2.3-Sampling and Testing: Frequency of sampling and testing shall be in accordance with the Contractor's quality control plan. When Item 308001-*, Class 1 aggregate is used as a shoulder material for resurfacing projects and these projects have a resurfacing depth of less than 3 inches (75 mm), and where the shoulder area is not boxed out, gradation samples may be taken from the stockpile prior to placement. The minimum frequencies shall be as indicated in applicable portions of MP 307.00.50. Aggregate shall be sampled in accordance with MP 700.00.06, Aggregate Sampling Procedures.

308.2.4-Acceptance Procedure: Material conforming to the specification requirements will be accepted at full contract price. Material failing to comply with the quality requirements of Table 704.6.2 shall not be incorporated into the work.

Acceptance for compaction and for gradation shall be in accordance with appropriate portions of 308.2.4.1. Shoulder aggregate adjacent to higher type pavement shall be compacted by pneumatic tire rollers.

308.2.4.1-Acceptance Plan: Acceptance for compaction of aggregate for roadway reconstruction shall be on a lot by lot basis. A lot shall consist of a single layer of not more than 2,000 linear ft. (600 meters) per width being placed. A lot shall be divided into five approximately equal sized sublots. One nuclear moisture and density measurement in accordance with applicable portions of 717 shall be made at a random location within each of the five sublots. The random locations shall be determined in accordance with MP 712.21.26. If the result of five density tests on a lot indicates that at least 80 percent of the material, in accordance with 106.3.1 (West Virginia AP-A), has been compacted to the specified target percentage of dry density, the lot will be accepted. If less than 80 percent has been compacted to the specified target percentage of dry density, no additional material shall be placed on that layer until it has been reworked to meet the specified requirements. Reworking and retesting shall be at the expense of the Contractor. When the Division performs the testing in the evaluation of the reworked lots, the testing will be at the expense of the Contractor at the unit cost specified in 109.2.2.

Acceptance for compaction of shoulder aggregate adjacent to higher type pavement shall be based on visual inspection to assure that the surface of the shoulder has been compacted to the level of the finished pavement surface. Shoulder aggregate adjacent to higher type pavement shall be compacted by pneumatic tire rollers.

Acceptance for compaction of Class 7 aggregate shall be based on visual inspection to assure that the aggregate particles are arranged in a stable manner.

Acceptance for gradation shall be on the basis of test results on consecutive random samples from a lot. A lot shall be considered the quantity of material, represented by an average test value, not to exceed five sublots. A subplot shall consist of a quantity of material represented by a single gradation test. The material shall be sampled and tested in accordance with 308.2.3. The gradation test results shall be plotted on a control chart in accordance with MP 300.00.51.

When the average, or when the most recent three consecutive individual test values fall outside the limits of Table 704.6.2, the lot of material represented will be considered nonconforming to the extent that the last of its sublots is nonconforming. When a lot of material is nonconforming, then the last subplot contained shall have its price adjusted in accordance with Table 308.6.1. In no event however, shall a subplot of material have its price adjusted more than once, and the first adjustment which is determined shall apply.

Acceptance for gradation of Class 7 aggregate shall be on the basis of the Contractor's written certification that the material meets the gradation requirements. Certification shall include a description of the crushing operation indicating the screens used.

308.2.4.2-Degree of Nonconformance: When a subplot of material is to have its price adjusted, the percentage point difference between the nonconforming

308.2.4

test value and the specification limit shall be determined for each sieve size determined to be nonconforming and this value shall be multiplied by its appropriate multiplication factor as set forth in Table 308.2.4.2 to determine the degree of nonconformance on the sieve.

The total measure of nonconformance of an individual subplot is the sum of all nonconformances on the various sieve sizes of that subplot.

Acceptance for gradation shall be on the basis of test results on consecutive random samples from a lot. A lot shall be considered the quantity of material, represented by an average test value, not to exceed five sublots. A subplot shall consist of a quantity of material represented by a single gradation test. The material shall be sampled and tested in accordance with 308.2.3. The gradation test results shall be plotted on a control chart in accordance with MP 300.00.51.

When the average, or when the most recent three consecutive individual test values fall outside the limits of Table 704.6.2, the lot of material represented will be considered nonconforming to the extent that the last of its sublots is nonconforming. When a lot of material is nonconforming, then the last subplot contained shall have its price adjusted in accordance with Table 308.6.1. In no event, however, shall a subplot of material have its price adjusted more than once, and the first adjustment which is determined shall apply.

TABLE 308.2.4.2	
NONCONFORMING SIEVE SIZE	MULTIPLICATION FACTOR
2 in. (50 mm)	1.0
1 ½ in. (37.5 mm)	1.0
¾ in. (19 mm)	1.0
No. 4 (4.75 mm)	1.0
No. 40 (425 µm)	1.5
No. 100 (150 µm)	2.0
No. 200 (75 µm)	2.5

When the total degree of nonconformance has been established and it is 12.0 or less, the material will be paid for at an adjusted contract price as specified in Table 308.6.1.

When the degree of nonconformance is greater than 12.0, the nonconforming subplot shall be resolved on an individual basis, requiring a special investigation by the Engineer to determine the appropriate course of action to be followed.

CONSTRUCTION METHODS

**308.3-RECONSTRUCTING ROADWAY OR SHOULDER USING
ADDITIONAL AGGREGATE:**

308.3.1-Surface Preparation and Spreading of Aggregate: The existing

surface shall be scarified to a depth of 2 inches (50 mm) or as shown on the Plans. When existing shoulders are sloped steeper than the nominal $\frac{3}{4}$ in. per ft (6%), the existing shoulder material shall be shaped to achieve that slope prior to addition of aggregate. Subgrade soil or ditch soil shall not be mixed with the loosened material. The loosened material shall then be broken and reshaped to form a uniform grade and cross section.

The addition material for roadway reconstruction shall then be spread evenly over the surface so formed in an amount sufficient to provide a compacted thickness equal to the thickness shown on the Plans or as directed by the Engineer. The loose surface of the reconstructed roadway shall then be carefully shaped and brought to the proper grade and cross section by use of a blade grader or other equipment as may be required.

Aggregate for shoulders shall be spread over the prepared surface to a width as specified in the Plans and to a depth sufficient to bring the uncompacted surface to a height of at least 1 in. (25 mm) above the finished pavement edge elevation. For compacted shoulder thicknesses exceeding 3 inches (75 mm), the differential from the pavement edge elevation must be increased to assure that the loose aggregate thickness is approximately equal to $1 \frac{1}{3}$ times the compacted thickness. The loose aggregate is then to be shaped to proper grade and cross section maintaining the height differential.

308.3.2-Compaction and Finish: Compacting or rolling shall start along the edge and proceed towards the center, except that on superelevated curves compacting shall progress from the lower to the upper edge and shall continue until the stone is firmly set or keyed. When directed by the Engineer, the Contractor shall sprinkle the base with water in sufficient quantity to attain proper compacting. After final rolling, the surface shall be sprinkled with water at intervals as directed by the Engineer.

The roadway surface shall then be checked with a 10 ft. (3.048) straight edge and a crown board, and any unevenness more than $\frac{3}{8}$ inch (10 mm) in 10 ft. (3.048) shall be corrected and rerolled. Shoulder surfaces adjacent to higher type pavement need not be checked with the straightedge.

Each layer shall be compacted. The moisture content shall be maintained at a level sufficient to facilitate compaction. Required density testing shall be in accordance with the provisions of the appropriate portions of 717. The surface of each layer shall be maintained during the compaction operation in such a manner that a uniform texture is produced and the aggregates firmly keyed. The surface of the top layer shall be carefully trued by blading if necessary.

308.3.3-Roadway Surface Tolerance: The completed roadway surface shall not vary more than $\frac{3}{8}$ in. above (10 mm) or below plan grade, nor more than $\frac{3}{8}$ in. from (10 mm) a straightedge 10 ft. (3 m) long applied parallel to the centerline of the pavement. Deviations shall be corrected by scarifying, adding additional approved aggregate if necessary, reshaping, and recompacting.

308.3.4-Maintenance: When a surface is to carry traffic before receiving a surfacing or pavement, the Contractor shall maintain the surface until final

308.4

acceptance and prevent raveling by the application of additional aggregate or water, or both, as may be required to keep the base tightly bound.

308.4-RECONDITIONING ROADWAY WITHOUT ADDING AGGREGATE:

When reconditioning of roadway without addition of aggregate is specified, the work shall be carried out as prescribed below. The existing roadway shall be scarified to the depth of 2 inches (50 mm) or as shown on the Plans and to the width of the complete roadway or as shown on the Plans. The loosened material shall then be reshaped to form a uniform grade and cross section. It shall then be rolled. Compacting and rolling shall start along the edge and proceed towards the center, except that on superelevated curves compacting shall progress from the lower to the upper edge. When directed by the Engineer, the Contractor shall moisten the scarified material to attain proper compacting. Blading and watering of the surface, if ordered, shall be continued during the rolling operations.

The material shall be compacted in accordance with the requirements of 308.3.2.

The surface shall be satisfactorily maintained until the base or surface course has been placed. If required, additional water shall be applied to prevent raveling.

308.5-METHOD OF MEASUREMENT:

The quantity of work done under reconstructing roadway or shoulder using additional aggregate shall be measured by the ton (Mg) of material complete in place and accepted.

The number of tons (Mg) of "Traffic Bound Base Course or Shoulder" shall be determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail; by actual measured displacement of barges certified by the producer when water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor, except that truck scales are not required where the material is weighed at properly calibrated automatic batching plant facilities which are equipped with digital print-out equipment. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions. The Division may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales

or from the digital print-out of the weights, is correct.

Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales. A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time, date, truck identification and project number. Provision shall be made for constant zero compensation and further provision shall be made so that the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest.

In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

The quantity of work done under reconditioning roadway without adding aggregate will be measured by the square yard (meters) computing the area in square yards (meters), the length used will be the actual length measured along the centerline of the roadway surface and the width of the base shown on the Plans, plus the area of any widening, turnouts, or intersections, authorized and measured separately.

308.6-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials including water for compaction, scarification and manipulation of existing surface, and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

308.6.1-Price Adjustment: Aggregates not conforming with the gradation requirements as described in 308.2.4.1 will be paid for at the adjusted contract price based on the degree of nonconformance as specified in Table 308.6.1.

TABLE 308.6.1

ADJUSTMENT OF CONTRACT PRICE FOR GRADATION NOT WITHIN SPECIFICATIONS	
DEGREE OF NONCONFORMANCE	PERCENT OF CONTRACT PRICE TO BE REDUCED
1.0 to 3.0	2
3.1 to 5.0	4
5.1 to 8.0	7
8.1 to 12.0	11
Greater than 12	*

* The Division will make a special evaluation of the material and determine the appropriate action. Pending resolution of the matter, additional lifts of base or pavement shall not be placed over the nonconforming material.

309 THROUGH 310 -BLANK

SECTION 311

OPEN GRADED FREE DRAINING BASE COURSE

311.1-DESCRIPTION:

This work shall consist of constructing a base course of coarse stabilized aggregate spread and compacted on a prepared surface in accordance with these specifications and in reasonably close conformance with the lines, grades, thickness, and typical cross sections as shown on the Plans or as established by the Engineer. It is the intent to allow the Contractor a choice between asphalt stabilizer and Portland cement stabilizer.

311.2-MATERIALS:

Depending on the alternative chosen, (asphalt or Portland cement) the materials shall conform to the requirements of the following subsections of Division 700.

Material	Subsection	
Aggregate*	703.1, 703.2, 703.3, 703.4	AASHTO 57, 67, 357, or 467
Performance Graded Binders**	705.5	Standard grade for area
Portland cement***	701.1	Type 1
Water***	715.7	
Curing Material***	707.10	

* If river gravel is used, the crushed particle requirement shall be 100% two face fracture.

** Asphalt stabilized applications only.

*** Portland cement applications only.

CONSTRUCTION METHODS

311.3-GENERAL:

General requirements shall comply with the applicable portion of 401.3 of the Specifications.

311.4-COMPOSITION OF OPTIONAL STABILIZING MIXTURES:

If the asphalt stabilized alternative is used, the asphalt cement shall be confined to 2.0%, plus or minus 0.5% by weight of the mix if Blast Furnace Slag is used the asphalt cement may be increased.

If the Portland cement stabilized alternative is chosen, the cement shall be Type 1 and shall have a cement content of 150 ± 5 pounds per cubic yard ($90 \text{ kg} \pm 2 \text{ kg}$ per cubic meter).

311.5-TESTING:

311.6

Quality control testing by the Contractor shall be in accordance with 301.2.1 (for Portland cement bases) or 302.2.4 (for bituminous stabilized bases) of the Specifications. Unless otherwise specified, compaction testing shall be waived

311.6-WEATHER AND SEASONAL LIMITATIONS:

Weather and seasonal limitations shall be in accordance with 401.5 (for asphalt applications) or 301.4 (for Portland cement applications).

311.7-EQUIPMENT:

Depending on the alternative used, equipment shall meet the applicable requirements of 401.6, or 501.8 - whichever is appropriate.

311.8-PREPARATION AND BATCHING OF MATERIALS:

Preparation of materials for asphalt applications shall conform to the requirements of 401.7 of the Specifications except that the asphalt cement shall be heated within a temperature range of 250° - 275° F (120° - 135° C) and temperature of the mix shall be within the range of 200° - 250° F (95° - 120° C).

Preparation of materials for Portland cement applications shall conform to the requirements of 501.7.

311.9-MIXING AND TRANSPORTING REQUIREMENTS:

The materials used in asphalt mixes shall be mixed in a asphalt concrete mixing plant that has been inspected and approved by the Division. Transportation of such mixes shall be in accordance with 401.10 of the Specifications.

The materials used in Portland cement mixes may be mixed at a central mix plant, in a transit mix truck or a pugmill type mixer. Regardless of which type of equipment is used, the mixing time shall be a minimum of two minutes once all component materials are batched.

311.10-PLACING, SPREADING, AND/OR COMPACTING:

Placement of the stabilized material shall be by acceptable spreading equipment to the appropriate line, grade and thickness. Acceptable equipment includes asphalt pavers for asphalt stabilized bases and spreader boxes, self propelled spreaders or conventional concrete placing equipment for Portland cement stabilized bases.

A four to ten ton (3.6 to 9.1 Mg) steel wheel tandem roller shall be used to compact the asphalt stabilized free draining base material. The number of roller passes shall be two or three unless otherwise directed. In the case of the asphalt stabilized aggregate, the mat temperature, at the time of initial rolling, shall be between 150° and 175° F (65 and 80° C) unless otherwise directed. In the case of the asphalt stabilized aggregate, the purpose of the rolling is to compact the base sufficiently to support the weight of the equipment that will place the next layer or pavement. The compacted base is to be porous so that

water will drain through it. The base is not to be compacted to the point that it is not free draining or that the aggregate is crushed.

311.11-CURING:

Portland cement stabilized bases, immediately following spreading, shall be cured with the use of white polyethylene sheeting.

311.12-TOLERANCE:

Base tolerance shall meet the requirements of 302.11 for asphalt stabilized bases and 301.8 for Portland cement stabilized bases.

311.13-MAINTENANCE:

The Contractor shall maintain the base course porous and free from being contaminated or clogged by deleterious material, transported and deposited by construction equipment, traffic, etc., until the next layer of the pavement is placed. The Contractor shall also maintain the final surface of the base course true to specified line, grade and cross section until such time that the pavement is placed.

311.14-METHOD OF MEASUREMENT:

The quantity of work done will be the number of cubic yards (meters) established in the Proposal. Any additional work beyond the scope of the original plans but authorized by the Engineer will be measured in place and paid at the unit bid price, subject to the provisions of 104.2 and 109.2.

Base course constructed outside the lines, dimensions and cross sections shown on the Plans or designated will not be measured for payment.

311.15-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item below, which price and payment shall constitute full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including labor, tools, equipment, supplies, and incidentals necessary to complete the work.

311.16-PAY ITEM:

ITEM	DESCRIPTION	UNIT
311006-*	OPEN GRADED FREE DRAINING BASE COURSE	CUBIC YARD (METER)

* Sequence number

312 THROUGH 313 - BLANK

SECTION 314 AGGREGATE SUBBASE

314.1-DESCRIPTION:

This work shall consist of furnishing, spreading, and compacting one or more courses of aggregate on a prepared subgrade in accordance with these Specifications, and in reasonably close conformity with the lines, grades, thicknesses, and typical cross sections shown on the Plans or established by the Engineer.

Subbase aggregates are designated as Grade 1 and Grade 2. The grade of aggregate subbase will be shown on the Plans.

314.2-MATERIALS:

314.2.1-General: All materials will be approved by the Engineer prior to use.

The material shall be of such quality that it will bind readily to form a firm, stable subbase. Should the character of the material be such that insufficient fine or coarse materials are produced to properly bind and stabilize the subbase, the Contractor shall furnish additional approved fine or coarse materials to accomplish stabilization.

314.2.2-Grade 1 Subbase Aggregate: Grade 1 subbase aggregate shall be composed of crushed stone, crushed gravel, crushed slag, crushed chert, crushed red dog, or a combination thereof.

Material shall conform to the requirements of 704.6, Class 5, except that (1) the percent passing the No. 200 (75 μ m) sieve shall not exceed 15, (2) the liquid limit and plasticity index requirements will be waived, and (3) the amount of deleterious material shall be a maximum of 10 percent.

314.2.3-Grade 2 Subbase Aggregate: Grade 2 subbase aggregate shall be composed of stream bed or pit gravel, shale, chert, or red dog, unless one type is specifically called for on the Plans.

The material shall not have a maximum dimension greater than two-thirds the thickness of the course being placed. The material shall not contain more than 10 percent by weight of coal, clay, or other deleterious substances.

The plasticity index shall be not greater than six as determined by ASTM D 424 and the liquid limit shall be not greater than 25 as determined by ASTM D 423, both reported to the nearest whole number.

Red dog material shall meet the requirements of the second paragraph of 314.2.2.

CONSTRUCTION METHODS

314.3-EQUIPMENT:

Any machine, combination of machines, or equipment which will handle the material without undue segregation and produce the completed subbase meeting these Specifications for handling, spreading, moistening, mixing, and compacting may be used when approved by the Engineer.

314.4-PLACING:

Prior to the placing of any subbase course material on the subgrade, the subgrade shall meet the applicable requirements of 207.9 or 228. The profile grade of the subgrade shall be such that the specified thickness of the subbase will be obtained. No subbase shall be placed when the subgrade is frozen or when it is sufficiently wet that its surface can be marred by construction equipment.

The subbase shall be placed and shaped on the prepared subgrade, or any other surface, in layers to achieve the compacted thickness shown on the Plans. When more than one layer is required, each layer shall be shaped and compacted to the specified density before the succeeding layer is placed. Each layer shall be kept at least 500 ft. (150 meters) ahead of the succeeding layer. Tailgating will not be permitted. If power graders are used for spreading, the material shall be placed in windrows, uniformly and thoroughly mixed, prior to final spreading and compaction.

314.5-COMPACTING:

Quality control and acceptance for compaction of aggregate subbase shall be in accordance with 307.2.1 through 307.2.4.1 and 717. Each layer of aggregate subbase shall be compacted to the requirements in 717. Water shall be uniformly applied over the subbase materials during compaction in the amount necessary for proper consolidation. The surface of each layer shall be maintained during the compaction operations in such a manner that a uniform texture is produced and the aggregate firmly keyed. The surface of the top layer of the subbase course shall be carefully trued byblading if necessary.

314.6-TOLERANCE:

The completed surface shall not vary more than ½ in. (13 mm) above or below plan grade. Deviations shall be corrected by scarifying, adding additional approved aggregate if necessary, reshaping, and recompacting.

The subbase course shall be checked for proper thickness after final compaction. The Contractor shall refill all test holes with approved material and adequately recompact the material.

Any deficiency in total thickness of the subbase in excess of 1 in. (25 mm) shall be corrected.

314.7

314.7-MAINTENANCE:

The surface of the completed subbase shall be protected against the loss of fine material by the addition of moisture when necessary, and the surface shall be maintained in a satisfactory and smooth condition until such time that it is covered by a succeeding course or finally accepted.

314.8-METHOD OF MEASUREMENT:

The quantity of work done will be measured in cubic yards (meters), complete in place and accepted, as determined from the lines, dimensions, and cross sections shown on the Plans or authorized in writing.

Subbase constructed outside the lines, dimensions, and cross sections shown on the Plans or designated will not be measured for payment.

314.9-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including water, labor, tools, equipment, supplies, and incidentals necessary to complete the work.

DIVISION 400

BITUMINOUS PAVEMENTS

SECTION 401

HOT-MIX ASPHALT BASE, WEARING, AND PATCHING AND LEVELING COURSES

401.1 - DESCRIPTION:

This work shall consist of constructing one or more courses of hot-mix asphalt (HMA), mixed mechanically in a plant, composed of aggregate and asphalt material with or without reclaimed material, on a prepared foundation in accordance with these specifications and in reasonable close conformity with the lines, grades, weights or thicknesses, and cross sections shown on the Plans or established by the Engineer. The use of reclaimed material is the option of the Contractor.

The unit of measurement for HMA will be by the ton (megagram), square yard (square meter) or cubic yard (cubic meter).

The work will be accepted in accordance with these Specifications and the applicable requirements of 105, 106, and 109.

401.2 - MATERIALS:

The materials shall conform to the requirements of the following subsections of Division 700:

MATERIAL	SUBSECTION	TYPE OR GRADE
Performance Graded Binders	705.5	PG 64-22 or binder grade as specified in contract documents
Coarse Aggregate	703.1 thru 703.3	
Fine Aggregate	702.3	
Mineral Filler	702.4	

CONSTRUCTION METHODS

401.3 - GENERAL:

Construction methods to be used in performing the work shall be submitted to the Engineer for review prior to the start of work. This review may require modification of the proposed methods to provide the desired end product. All equipment, tools, machinery, and plant shall be maintained in a satisfactory working condition.

401.4 - COMPOSITION OF MIXTURES:

401.4.2

401.4.1 - General: The aggregate for use in the designated mixture shall consist of a mixture of aggregate (coarse, fine, reclaimed material if desired, or mixture thereof) and mineral filler if required. It shall be the responsibility of the Contractor to determine the percentage of reclaimed material to be used in the mix. The amount and grade of virgin PG Binder to be used in the RAP designs shall be determined in accordance with Materials Procedure (MP) 401.02.24.

401.4.2 - Plant Mix Formula: The Contractor shall submit a proposed Plant Mix Formula (PMF) for each combination of aggregate and asphalt material for each type of HMA to be produced. The HMA shall be designed in accordance with MP 401.02.22. The PMF gradations shall be within the tolerances set forth in Table 401.4.2. The design criteria shall be within the tolerances set forth in MP 401.02.22.

Each proposed PMF must be documented on the Division Form T-400 and the entire PMF package shall be forwarded for review to the District Materials Engineer/Supervisor. The T-400/PMF package shall then be transmitted to the Contract Administration Division, Materials Section for final review. If the PMF requires revision, it will be returned to the designer through the District. The T-400 Form shall contain the following information:

- i. Identification of the source and type of materials used in the design.
- ii. The aggregate blend percentages and the percentage for each sieve fraction of blended aggregate considered the desirable target for that fraction.
- iii. The percentage of asphalt binder representing the optimum asphalt content for the PMF submitted, which is to be considered the desirable target percentage.
- iv. The temperature of the completed mixture at the plant which shall be within $\pm 25^{\circ}\text{F}$ ($\pm 14^{\circ}\text{C}$) of the median mix temperature established by the design temperature-viscosity chart or as recommended by the asphalt supplier.
- v. The ratio (calculated to the nearest one-tenth percent) of the Fines to Asphalt (FA). The ratio is defined as the percentage of aggregate passing the No. 200 (75 μm) sieve, divided by the percentage of asphalt content calculated at the percentage optimum asphalt content of the design.

If it becomes necessary to change aggregate sources, a new PMF shall be developed and submitted for approval. Should the PG Binder source be changed on a mix design, the plant technician shall prepare a set of Marshall test specimens and two maximum specific gravity test specimens with the new binder at the optimum asphalt content. If the percent air voids and percent voids-filled-with-asphalt remains within the tolerance limits of Table 401.02.22A (MP 401.02.22) and the voids-in-mineral-aggregate, stability, and flow values meet the minimum requirements of Tables 401.02.22A and 401.02.22B then the binder from the new source may be used without

redesigning. The results of this testing shall be sent to the Contract Administration Division, Materials Section, through the District Materials Section. The mix with the new binder shall then be required to go through a new mix verification process as described in Section 401.6.2.

At no time shall different grades or sources of PG Binders be mixed together in the same storage tank. When it is necessary to switch to a new binder grade, or binder of the same grade from a different source, the tank shall be drawn down as far as possible, normally to the top of heating coils, before refilling with the new binder. The new binder shall be circulated thoroughly before restarting production.

401.6 - CONTRACTORS QUALITY CONTROL:

401.6.1 – Technician Requirements And Quality Control Plans: Quality control of HMA is the responsibility of the Contractor. The Contractor shall maintain equipment and qualified personnel including at least one certified HMA Technician at each plant. The technician shall be in charge of all plant quality control activities such as mix proportioning and adjustment and all sampling and testing activities necessary to maintain the various properties of HMA within the limits of the specification. A certified HMA Inspector may handle sampling and testing activities under the supervision of the plant technician.

The Contractor shall maintain equipment and qualified personnel including at least one certified Compaction Technician at each project. A certified Compaction Technician shall perform all testing necessary to assure compaction of the HMA meets specification requirements. The Contractor, or Contractor-Producer, shall design a workable quality control plan, detailing the type and frequency of sampling, and testing deemed necessary to measure and control the magnitude of the various properties of the HMA governed by these Specifications. This plan, prepared in accordance with MP 401.03.50, shall be submitted to the Engineer for review prior to production of material under this

Specification.

401.6.2 - Plant Mix Formula Field Verification: For each PMF, a mix design field verification shall be conducted during the first days of plant production using the guidelines established in MP 401.02.27. This field verification is for the purpose of demonstrating that the PMF can be produced within the specified tolerances set forth in MP 401.02.27. If the mix cannot be produced within these requirements, a new mix design will be required.

401.6.3 – Quality Control Testing Requirements: After the PMF field verification has been successfully completed, sampling frequency and requirements for quality control testing shall be as set forth in MP 401.02.27. If the Division determines that a mix cannot be consistently produced within the tolerance limits of the specified design properties, approval of the mix may be revoked and the contractor will be required to provide a new mix design.

401.7 - ACCEPTANCE TESTING:

Acceptance testing of HMA is the responsibility of the Division.

401.7.1 – Surface Tolerance: It is the intent of these Specifications that projects with a total new pavement thickness of 3 inches (75 mm) and minimum length of two lots (1100 ft = 340 m) shall be constructed to provide a smooth riding surface. The smoothness of the riding surface will be determined by the Engineer using an inertial profilometer or Mays Ride Meter. The smoothness testing will generally be accomplished within 30 days after the project is complete.

The pavement will be divided into sampling LOTS of one-tenth (0.1) lane mile (0.16 km) each. Each LOT shall exhibit a smoothness measurement, expressed in inches per mile (millimeters per kilometer) equal to or less than that shown in the appropriate Table 401.7.1E or 401.7.1M. When a LOT is represented by a smoothness number greater than that shown in Tables 401.7.1E or 401.7.1M, the unit price shall be adjusted as in 401.13.2.

TABLE 401.7.1E	
Total New Pavement Thickness	Smoothness
3 inches to less than 4 inches	81 inches per mile or less
4 inches or greater	65 inches per mile or less

TABLE 401.7.1M	
Total New Pavement Thickness	Smoothness
75 mm to less than 100 mm	1250 mm/km or less
100 mm or greater	1000 mm/km or less

When compaction is completed on the course, it shall present a uniform surface, true line and grade, conforming to the cross section shown on the Plans.

When tested with a straightedge, approximately 10 feet (3 meters) in length, and a template of the specified dimensions, the finished base course shall not show a deviation greater than ¼ inch (6 mm) and the finished wearing course shall not show a deviation from the required surface greater than 3/16 inch (5 mm).

The Contractor shall provide the straightedge and template for checking the surfaces, and an employee to use them under the direction of the Engineer. Any irregularity of the surface exceeding the limits specified shall be corrected. Depressions which develop after the initial rolling shall be corrected by loosening the mixture and adding new material. High places shall be corrected by removing excess material.

Areas of completed courses found to be defective shall be removed and replaced with approved mixtures laid in accordance with these specifications, and no additional compensation will be allowed for materials used or work involved in replacing defective areas.

401.7.2 - Compaction: Acceptance testing for compaction shall be performed in accordance with either the Lot-By-Lot method described in Section 401.7.2.1 or by the rollerpass procedure described in MP 401.05.20 based on the total new pavement thickness and the lift thickness provided in Table 401.7.2. Patching-and-leveling and scratch courses shall not be included in determining the total new pavement thickness. When HMA is placed in areas that require a nonuniform thickness or is tapered to a thin edge, the method of acceptance testing shall be determined by the Engineer.

Table 401.7.2

Mix Design Type	Total New Pavement Thickness	Lift Thickness ^(Note 1)	Compaction Method
Heavy	≥ 2.5 inches (63 mm)	≥ 1 inch (25 mm)	Lot-by-Lot
		< 1 inch (25 mm)	Rollerpass
Heavy	< 2.5 inches (63 mm)	> 1 inch (25 mm)	Lot-by-Lot
		≤ 1 inch (25 mm)	Rollerpass
Medium	≥ 3.0 inches (75 mm)	> 1 inch (25 mm)	Lot-by-Lot
		≤ 1 inch (25 mm)	Rollerpass
Medium	< 3.0 inches (75 mm)	All lifts	Rollerpass

Note 1: Any lift that is placed at a thickness of less than two times the nominal maximum aggregate size as specified in Table 401.4.2 shall be compacted using the rollerpass method

401.7.2.1 – LOT-By-LOT Testing: Randomly located nuclear density tests will be performed in accordance with the LOT-By-LOT test procedure described in MP 401.05.20. The pavement shall be divided into LOTS not exceeding 1000 feet (300 meters) of paving lane. A randomly located density test shall be conducted in each LOT. The density shall be within the range of 92.0 to 96.0% of the maximum density of the approved mix design or the maximum density established under Section 401.6.2, Plant Mix Formula Field Verification. If the density is outside the range, an additional five tests shall be conducted for the LOT and the average of these five tests used to judge acceptance of the LOT in accordance with Table 401.13.3.

Acceptance testing is not required on areas in which a full-size roller is restricted from properly compacting the mat. These areas shall be compacted to the satisfaction of the Engineer.

401.7.3 – Thickness: When a uniform thickness of three inches (75 mm) or more is specified, excluding resurfacing, cores shall be taken to verify the thickness of the compacted pavement.

Cores will be taken by the Division at random locations. The sampling frequency shall be approximately five cores per 2000 feet (600 meters) of two-lane construction, except that the sampling frequency shall normally be limited to a minimum of five and a maximum of 50 cores per project. The Division may elect to waive coring for short projects of less than 1000 feet (300 meters) in length or for projects where a paving mat of uniform thickness cannot be expected (for example: tapered paving mats or pavement widening projects).

401.8

The Division may also elect to take additional cores when needed to resolve problems related to pavement thickness.

The thickness shall be considered acceptable if one or both of the following criteria is met.

- (A) The average thickness equals or exceeds the specified thickness.
- (B) The average thickness is less than the specified thickness, and the difference is not statistically significant at the 95% confidence level. (Standard one tail “t” test at 0.05 significance).

The calculated ‘t’ value shall be less than or equal to the standard ‘t’ val at the 95% confidence level. The method for calculating Criteria ‘B’, shall be as follows:

$$t \leq t_{95} \quad \text{Where:}$$

$$t_{95} = \text{value from standard “t” table for 95\% confidence level.}$$

$$t = \frac{x_s - \bar{x}}{s} \sqrt{n-1}$$

$$x_s = \text{specified thickness}$$

$$\bar{x} = \text{average thickness}$$

$$n = \text{number of samples}$$

$$s = \sqrt{\frac{\sum x^2 - \frac{(\sum x)^2}{n}}{n-1}}$$

$$x = \text{individual core thickness}$$

If the average thickness is less than specified and is determined to be significant as determined by criteria ‘B’, the Division shall decide on a course of action as described in Section 401.13.4.

401.8 - WEATHER RESTRICTIONS:

HMA shall only be placed when the surface is dry and when weather conditions are such that proper handling, finishing, and compaction can be accomplished. In no case however, shall HMA be placed when the surface temperature is below the minimum established in Table 401.8.

TABLE 401.8	
Course Thickness	Minimum Surface Temperature
3 inches (75 mm) and over	35 °F (2 °C)*
1.5 to 2.9 inches (38 to 74 mm)	40 °F (4 °C)
Less than 1.5 inches (38 mm)	50 °F (10 °C)

*In lieu of 35 °F (2 °C), a minimum air temperature of 40 °F (4 °C) shall be used when paving directly on an aggregate base, subbase, or subgrade.

In addition to the above surface temperature requirements, no surface courses shall be placed when the air temperature is less than 40 °F (4 °C).

Mixtures shall be laid only on dry surfaces and only when, in the opinion of the Engineer, weather conditions are suitable.

401.8.1 - Cold Weather Paving: When the air temperature falls below 50 °F (10 °C) or the surface temperature fall below 60 °F (15 °C) the provisions for cold weather paving shall apply.

Paving shall be performed so that the transverse joints in adjacent lanes shall be no more than 50 feet (15 meters) apart at the end of each days paving operations.

The surface temperature shall be taken a minimum of once every hour and shall be taken in all shaded areas. The temperature requirements as listed in Section 401.8 shall apply.

It shall be the Contractor's responsibility to monitor the declining surface temperature to insure that material delivery from the plant be terminated so as to allow that all material can be placed prior to the surface temperature falling below the surface temperatures listed in Section 401.8.

The temperature of the delivered material and the mat temperature at the time final density is obtained shall be taken on every truckload. These temperatures shall be in accordance with Section 401.10.3 for delivered material and 401.10.4 for the mat temperature at the time final density is obtained.

401.9 - EQUIPMENT:

401.9.1 - Plants: All plants in West Virginia producing HMA for the Division shall provide documented evidence of compliance with current requirements of the West Virginia Air Pollution Control Commission.

All plants which are not in West Virginia but producing HMA for the West Virginia Division of Highways shall provide documented evidence of compliance with current requirements of the laws and regulations of the State in which they are producing, applicable to air pollution.

All plants shall meet the requirements set forth in AASHTO M156.

401.9.5

401.9.2 - Dust Collector: An efficient dust collecting system shall be provided to prevent the loss of fine material. The material collected may be returned to the mixture at a uniform rate or discarded.

401.9.3 - Truck Scales: Truck scales shall be provided at each Plant, except that truck scales are not required at properly calibrated automatic batching plant facilities which are equipped with digital printout equipment, and which load the trucks directly from the mixer or weigh hopper in a surge or storage bin.

A weigher shall be provided by the producer. The weigher shall certify that the weight of the HMA, as determined either by the truck scales or from the digital printout of the batch weights, is correct.

Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales.

All truck scales shall be mounted on solid foundations which will insure them remaining plumb and level.

Approval and sealing of scales shall be conducted at the frequency determined by the West Virginia Division of Labor, Bureau of Weights and Measures, and when the plant is moved, or upon the request of the Engineer. The Engineer shall be notified of any scale malfunctions when material is being furnished to Division of Highways projects. The Division may, at its option, accept inspection and sealing by out of state agencies when the mixing plant is located outside West Virginia.

A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time, date, truck identification, and project number. Provision shall be made for constant zero compensation and further provision shall be made so that the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

The scales shall be of sufficient size and capacity to weigh the loaded trucks that are used for delivery of HMA from the plant.

401.9.4 - Test Weights: As part of its standard equipment, each plant which proportions aggregate by weight shall provide a minimum of ten 50 pound (22.68 kg) test weights for the purpose of maintaining the continued accuracy of weighing equipment.

Plants which proportion asphalt material by weight shall furnish, in addition to the above, one five pound (2.268 kg) test weight.

401.9.5 - Surge and Storage Bins: During the normal daily operation of the plant, HMA may be stored in a surge or storage bin for a maximum of 12 hours, provided the bin has received prior evaluation and acceptance through the District plant inspection. The temperature of the material at time of

placement and compaction shall be sufficient to properly perform these activities.

Longer silo storage times, up to 24 hours, may be permitted for dense graded HMA if the storage silo is insulated and/or heated to assure that the proper mix temperature is maintained. The gates at the bottom of the storage silo shall be adequately heated and sealed when the HMA is held for the extended period of time. An inert gas system may be used to purge the silo of oxygen to prevent oxidation of the asphalt. The HMA delivered from the storage silo shall meet all of the specification requirements.

When HMA is stored for the extended time period it shall not be used until the temperature has been checked and the HMA has been visually inspected for hardening of the mix and stripping of the asphalt from the aggregate. Approval of the extended storage time may be revoked if it is determined through inspection and/or testing that the extended storage is having a detrimental effect on the HMA.

Loading of trucks through the storage bin will only be permitted when a minimum 25 ton (23 Mg) buffer of material is being maintained or an amount as recommended by the bin manufacturer. Means shall be provided for loading the trucks directly from the mixer when the storage bin is not in operation.

401.9.6 - Inspection of Equipment and Plant Operations: The Engineer shall have access to the plant to assure the adequacy of the equipment in use, to inspect the conditions and operation of the plant, to verify weights, to verify the proportion and character of materials, and to determine if specified temperatures are being maintained in the preparation of the mixture.

401.9.7 - Trucks for Transporting Mixture: The inside surfaces of trucks shall be thinly coated with a soapy water or a mixture with not more than ten percent lubricating oil. The use of diesel fuel, kerosene, or similar solvent-based products which can dissolve the asphalt film from the aggregate particles will not be permitted. Any commercial release agent which can be certified as harmless to the mix may be used, however, the Division reserves the right to restrict any release agent that is shown to cause problems with the mix. In the case of mixtures composed of PG Binders which contain polymer modification, truck surfaces should be coated with a release agent recommended by the binder supplier. All excess coating material shall be removed from the truck bed prior to loading the HMA.

All truck beds shall be insulated with approved material. No trucks shall be used which cause segregation of the materials, which show large oil leaks, or which cause undue delays in delivery of material. All trucks shall be provided with a waterproof cover and a hole in the body for the purpose of conveniently checking the temperature of the load. Covers shall be suspended slightly above the mixture, shall extend over the sides of the truck, and shall be securely fastened to eliminate air infiltration and to prevent water from coming in contact with the mixture.

401.9.8

401.9.8 - Laboratory: A testing facility or laboratory, as described below, shall be provided within reasonable proximity of the HMA plant. Plant operations must be visible from within the laboratory.

The laboratory shall be of sufficient size to hold all laboratory test equipment and supplies with adequate floor space to allow the technicians to test samples in an efficient manner. The laboratory shall be furnished and maintained with adequate ventilation, heat, light, water, sink and drainage, electrical or gas outlets, or both, work table, shelves, and supply cabinets.

The laboratory shall be supplied with the equipment and materials listed below and these shall be maintained to meet the applicable requirements of ASTM or AASHTO.

- i. Hot plate, gas or electric.
- ii. Large ovens (as needed for heating and drying samples), gas or electric.
- iii. Unit weight container, ½ cubic feet (.014 cubic meter) - Required only when slag is used.
- iv. Balances of sufficient capacity and accuracy for conducting specified tests and plant calibration.
- v. A Division approved method of determining asphalt content [AASHTO T164 extraction, AASHTO T287 nuclear asphalt content gauge with printing capability, AASHTO TP53 asphalt content ignition oven, weigh ticket on automated plants].
- vi. Thermometers, dial type and glass, as required for conducting standard test procedures and monitoring mix temperatures.
- vii. Standard Gilson shaker or equivalent, with screens.
- viii. Ro-Tap shaker or equivalent, with 8 and/or 12 inch (200 and/or 300 mm) diameter screens.
- ix. Sample splitters for fine and coarse aggregates.
- x. Miscellaneous items (including sample splitting tools, scoops, square point shovel, aggregate sample pans, heat resistant gloves, measuring rules, brushes, flashlight, and glassware as needed).
- xi. Expendable supplies necessary for performance of tests.
- xii. Marshall equipment necessary to comply with AASHTO T245 and ASTM D5581, including a calibrated automatic testing apparatus having recording capabilities and compaction hammers.
- xiii. Equipment for determining the maximum specific gravity of asphalt mixtures as specified in AASHTO T209.
- xiv. Equipment for determining the in place density of asphalt mixtures meeting the requirements of ASTM D2950.
- xv. Non-contact infrared thermometer accurate to $\pm 2^{\circ}\text{F}$ ($\pm 1^{\circ}\text{C}$).
- xvi. Equipment for determining the bulk specific gravity of compacted asphalt/ aggregate mixture using saturated surface dry specimens complying with AASHTO T166.

401.9.9 - Spreading Equipment: Spreading equipment shall be self-contained and of sufficient size, power and stability to receive, distribute and strike-off the asphalt mixture at rates and widths commensurate with the typical sections and other details shown on the plans. The spreading equipment shall be provided with an activated screed or strike-off assembly equipped to be heated. Approval of spreading equipment by the Engineer will be based on the demonstrated capability of the equipment to place the mixture to the required cross-section, profile and alignment in an acceptable, finished condition ready for compaction. Specialized equipment or hand methods approved by the Engineer may be employed to spread the asphalt mixture where the use of standard full scale spreading equipment is impractical due to the size or irregularity of the area to be paved.

Paving machines shall be equipped with mechanical or automatic grade and slope controls. The use of automatic grade and slope controls with a traveling straight edge shall be required only when specified on the Plans or in the Proposal. Both the grade and slope controls shall be in working order at all times. In the event of failure of the automatic controls, the Contractor will be permitted to finish the day's work using manual controls but will not be allowed to resume work the following day until the grade and slope controls are in proper working order.

401.9.10 - Compaction Equipment: Compaction may be performed by self-propelled steel-wheeled, pneumatic tired and/or vibratory rollers. Hand held rollers or vibrating plates may be used in small inaccessible areas if approved by the Engineer. Prior to use on any project the roller shall be inspected to see that it is in good mechanical condition. The total weight, weight per inch of width (steel-wheeled), and average ground contact pressure (pneumatic-tired) shall be documented.

401.10 - PAVING OPERATIONS:

401.10.1 - Cleaning and Sweeping: Immediately prior to the arrival of the paving mixture, the existing base or surface shall be thoroughly cleaned by the use of tools and equipment as may be required to remove all mud, dirt, dust, and other caked or loose material foreign to the type of treatment or surface being placed. The cleaning shall be done to a minimum width of one foot on each side beyond the width of the surface being placed.

401.10.2 - Patching and Leveling and Scratch Courses:

401.10.2.1 - Patching and Leveling: A tack coat shall be applied to the existing pavement prior to placing patching and leveling.

Patching and leveling shall be placed at various locations throughout the project to remove irregularities in the existing pavement such as dips, or to raise the outside edge of the existing pavement to provide a uniform template prior to placing a base or wearing course. Patching and leveling shall not be placed as a continuous layer or course over the full width and length of the project.

401.10.3

Compaction of patching and leveling shall be performed with three-wheel (steel) or pneumatic tire rollers.

401.10.2.2 - Scratch Course: A tack coat shall be applied to the existing pavement prior to placing a scratch course.

The scratch course shall be placed to the limits designated on the plans. Scratch course can be placed with a paving machine or grader with shoes. The paving machine screed or grader blade shall be set to drag on the high areas of the existing pavement only depositing material in ruts and other depressions.

The wearing course or at least one lift of base course should be placed over the scratch course prior to maintaining traffic in the lane where the scratch course has been placed. All repairs to a scratch course due to traffic damage shall be at the contractors expense.

Compaction of a scratch course shall be performed with a three-wheel (steel) or pneumatic tire roller.

401.10.3 - Spreading and Finishing: Before spreading any material, the contact surfaces of curbs, gutters, manholes, and of adjacent Portland cement concrete pavement edges shall be painted or sealed with asphalt material. Exact edge of pavement, except on concrete, shall be established by a string or chalk line for a distance of not less than 500 feet (150 meters) ahead of the spreading operation.

For mixes produced with unmodified asphalts (such as PG 64-22 or PG 58-28) the temperature of the mixture at the time of placement shall be within the temperature requirements of the PMF. The PMF temperature range shall be within the master temperature range of 250 and 338 °F (121 and 170 °C). The mix temperature shall be monitored by inserting a dial type thermometer into the mix through the hole in the truck bed.

The temperature of the completed mix, when measured at the plant, shall be within the tolerance as established by the PMF. The first load, which demonstrates temperatures outside of that range may be accepted provided that the temperature is still within the master temperature range. However, no additional loads of material shall be run out of the plant until necessary steps are taken to reestablish the temperature of the mix within the plant tolerance. When measured at the project site, the temperature of the mix shall be within the tolerance established by the PMF. The first truck load of material which demonstrates temperatures outside of that range or any trucks in transit at that time may be accepted provided temperatures are within the master temperature range. However, the plant shall immediately be notified that no additional loads of material are to be dispatched until necessary action is taken to reestablish temperature within PMF specification limits.

When the surface temperature falls to within 10 °F (6 °C) of the weather restrictions included in Table 401.8 the mix temperature may be increased up to a maximum of 338 °F (170 °C) unless otherwise specified by the asphalt supplier. The temperature of each truckload of material shall be monitored for compliance. Any truckload of material which exceeds this maximum

temperature may be rejected by the Engineer.

Mixes produced with asphalts that contain modifiers for high or low temperature performance enhancement shall meet the temperature requirements recommended by the asphalt supplier which will be referenced on the PMF.

401.10.4 - Rolling Procedure: Shoulders, ramps, and similar areas shall be compacted in the same method as the mainline.

During rolling, roller wheels shall be kept moist with only enough water to avoid picking up material. Fuel oil on roller wheels or pneumatic tires is not allowed. Rollers shall move at a slow but uniform speed with the drive roll or wheels nearest the paver.

If rolling causes material displacement, the affected area shall be loosened at once with lutes or rakes and restored to their original grade with loose material before being re-rolled. Heavy equipment, including rollers, should not be permitted to stand on the finished surface before it has thoroughly cooled or set.

Mat temperature shall be measured using a non-contact infrared thermometer. The required density shall be obtained prior to the mat temperature reaching 175 °F (80 °C). The Contractor shall be allowed to lower this temperature to 165 °F (74 °C) if they can demonstrate during the first day of placement of each lift on each project that additional densification can be achieved without causing any pavement distress.

401.10.5 - Joints: The longitudinal joint in any layer shall offset that in the layer immediately below by approximately six inches; however, the joint in the top layer shall be at the centerline of the pavement if the roadway comprises two lanes of the width, or at lane lines if the roadway is more than two lanes in width. The transverse joint in any layer shall offset that in the layer immediately below by approximately six feet (1 800 mm).

Joints between the existing and new HMA pavement shall be "heeled in" to the existing surface at the beginning and at the end of the project and at all other locations where the new pavement terminates against an existing HMA pavement. These joints as well as the transverse joints between one days production and the next shall be carefully constructed and shall be formed by cutting back into the existing section to expose the full depth of the course. All joints shall be squared up to the full vertical depth of the course to be placed, and a tack coat of asphalt material shall be applied if called for by the Engineer.

Joints adjacent to curbs, gutters, or adjoining pavement shall be formed by transporting back sufficient hot material to fill any space left uncovered by the paver. The joint shall be set up with lutes to a sufficient height to receive the full compactive effort from the rollers. After rolling, joints shall be at the same elevation as the adjacent lanes or sections and shall be free from ridges or depressions.

Transverse joints shall be checked for smoothness with a 10 foot (3 meter) straight edge provided by the Contractor. All surface irregularities shall be corrected prior to proceeding with paving operations.

401.11.2

401.11 - PROTECTION OF PAVEMENT AND TRAFFIC CONTROL:

The Contractor shall be responsible for the protection of HMA surfaces from damage by their equipment and personnel. When the construction of HMA surfaces is undertaken on projects under public traffic and the road surface is 16 feet (4.9 meters) wide or greater and the ADT is 400 or greater, the Contractor shall place No Passing Signs and Interim Pavement Markings to delineate the centerline or lane line of the roadway as required herein. The Contractor shall be responsible for maintaining both signs and markings until such time as the permanent markings are placed or thirty calendar days after completion of the final course whichever is less. No separate payment will be made for maintenance of these items but shall be included in the applicable pay items for initial installation. All Interim Markings shall be in conformance with the Manual on Uniform Traffic Control Devices (MUTCD), and shall be installed by the end of the work day by placing the markings as the paving operation progresses within 1000 feet (300 meters) of the paver. Interim Markings shall be Type VII A pavement markings meeting the requirements of Section 715.40.4.1. Payment of Interim Pavement Markings shall be incidental to the 401 Items. Removal of Interim Markings shall not be required between lifts or after placement of the final markings.

401.11.1 - Interim Traffic Control for Two-Lane, Two-Way Roadways:

Prior to any work which will cover the centerline, the Contractor shall install 24 inch x 30 inch (600 mm x 750 mm) “DO NOT PASS” (R4-1) signs on permanent post at the beginning of each no passing zone throughout the length of the project. These signs shall be placed at the beginning of each no passing zone and shall be repeated every 2500 feet (750 meters) as required. Payment shall be made under Item 636011-*, “Traffic Control Devices”.

To delineate the centerline of the roadway, the Contractor shall install yellow Interim Pavement Markings measuring 4 inch x 4 inch (100 mm x 100 mm) along the centerline of the roadway on 20 foot (6 meter) centers.

401.11.1.1 - Temporary Pavement Markings with ADT of 3,000 or Greater: The Interim Pavement Markings described in Section 401.11.1 shall be permitted only for a period up to three calendar days after completion of the final course. Within this time the Contractor shall install full compliance centerline Temporary Pavement Markings (i.e. passing and no passing zones delineated) in conformance with Sections 636 and 663. Payment shall be made under Item 636008-*, “Temporary Pavement Marking Paint”.

401.11.2 - Interim Traffic Control for One-Way Multilane Roadways:

On all one-way multilane roadways, the Contractor shall install white Interim Pavement Markings measuring 4 inches x 48 inches (100 mm x 1200 mm) along the lane line. Interim Pavement Markings shall be placed on 40 foot (12 meter) centers.

401.11.2.1 - Temporary Pavement Markings: Prior to the left lane being open to traffic, the Contractor shall install a four inch yellow edge line. These markings shall be in conformance with Sections 636 and 663. Payment shall be made Item 636008-*, “Temporary Pavement Marking Paint”.

401.11.3 - Interim Traffic Control for Two-Way Three-Lane Roadways: Prior to any work which will cover the centerline and/or lane lines, the Contractor shall install 24 inch x 30 inches (600 mm x 750 mm) “DO NOT PASS” (R4-1) signs on permanent post at the beginning of each no passing zone throughout the length of the project as required. “DO NOT PASS” signs in both directions will be required for Center Left Turn Lanes. These signs shall be placed at the beginning of each no passing zone and shall be repeated every 2500 feet (750 meters) as required. Signs shall be maintained by the Contractor until temporary or permanent markings are installed. Payment shall be made under Item 636011-*, “Traffic Control Devices”.

The Contractor shall install Interim Pavement Markings measuring 4 inches x 48 inches (100 mm x 1200 mm). Where truck climbing lanes exist, the centerline shall be marked with two parallel yellow lines separated by a four inch (100 mm) space placed on 40 foot (12 meter) centers. Lane lines shall be marked with white lines placed on 40 foot (12 meter) centers. Where center left-turn lanes exist, the center lane shall be marked with two parallel yellow lines separated by four inches (100 mm) space placed on 40 foot (12 meter) centers on both sides of the center lane.

401.11.3.1 - Temporary Pavement Markings: The Interim Pavement Markings described in Section 401.11.3 shall be permitted only for a period of up to three calendar days after completion of the final course. Within this time the Contractor shall install full compliance centerline and lane line Temporary Pavement Markings in conformance with Sections 636 and 663. Payment shall be made under Item 636008-*, “Temporary Pavement Marking Paint”.

401.11.4 - Interim Traffic Control for Two-Way Four-Lane and Five-Lane Roadways: On all two-way four-lane and five-lane highways, the Contractor shall install Interim Pavement Markings measuring 4 inch x 48 inch (100 mm x 1200 mm) along the lane line and centerline where required. Centerlines shall be marked with two parallel yellow lines separated by a four inch (100 mm) space placed on 40 foot (12 meter) centers. On five-lane roadways these markings shall be placed on both sides of the center left turn lane. Lane lines shall be marked with white lines placed at 40 foot (12 meter) centers.

401.11.4.1 - Temporary Pavement Markings: The Interim Pavement Markings described in Section 401.11.4 shall be permitted only for a period of up to three calendar days after completion of the final course. Within this time the Contractor shall install full compliance lane line and centerline or left edge line Temporary Pavement Markings in conformance with Sections 636 and

401.13

663. Payment shall be made under Item 636008-*, "Temporary Pavement Marking Paint".

401.11.5 - Seasonal Temporary Markings: Unless otherwise described above, if it becomes necessary to open the roadway to traffic whether on the base or final course, for longer than 14 calendar days, the Contractor shall install full compliance Temporary Pavement Markings in conformance with Section 636 and 663. Payment shall be made under Item 636008-*, "Temporary Pavement Marking Paint".

401.12 - METHOD OF MEASUREMENT:

The quantities of work done will be measured in square yards, tons or cubic yards, as designated, for "Hot-Mixed Asphalt Base Course" or "Hot-Mix Asphalt Wearing Course," incorporated into the completed and accepted work. Measurement of "Hot-Mix Asphalt Patching and Leveling Course" will be on the basis of tonnage (Mg) only.

When measured by the square yard (square meter), the quantity will be determined as follows: The width for measurement will be the width of the pavement shown on the typical cross section of the Plans and additional widening where called for, or as otherwise directed in writing by the Engineer. The length will be measured on the surface along the centerline of each roadway or ramp.

When measured by the ton, the quantity will be determined by the Contractor from the total weigh slips for each vehicle load weighed upon an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor as correct.

When measured by cubic yard, the quantity will be the number of cubic yards established in the proposal, determined by the dimensions on the plans or contract document, subject to adjustment as provided in 104.2 and 109.2.

Any patching or leveling mixture placed on a subbase or base course constructed in the same Contract with the HMA items shall be at the expense of the Contractor. No additional compensation will be allowed for the material or any work incidental to its placement.

401.13 - BASIS OF PAYMENT:

The quantities determine as provided above, will be paid for at the contract unit price for the items listed below, which prices and payment shall be full compensation for furnishing all the materials and doing all the work herein prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, field laboratory, supplies, and incidentals necessary to complete the work.

The conditioning, cleaning, and sweeping of the existing base or underlying surface shall be considered as part of the construction of the appropriate items listed in 401.14, and no additional compensation will be allowed for "Cleaning and Sweeping".

401.13.1

There will be no additional compensation for tack coat material used for minor (spot) areas to be patched and leveled; the cost of this tack coat material will be included in the unit bid price for Item 401-3.

There will be no additional compensation for Interim Pavement Markings.

401.13.1 - If HMA is found not in compliance with the provisions of 401.6.3, production shall cease until the Contractor demonstrates that the PMF can be met.

401.13.2 – When a LOT of HMA pavement is represented by a smoothness value larger than that shown in Tables 401.7.1E or 401.7.1M, the unit price of the LOT (surface course only) shall be determined as follows:

ENGLISH VERSION:

Reduced Unit Price = Unit Bid Price X [(127.86 – As)/100]

Where A = 0.429 when specified smoothness is 65 in/mi

Where A = 0.341 when specified smoothness is 81 in/mi

Where s = Smoothness value measured as per 401.7.1

METRIC VERSION:

Reduced Unit Price = Unit Bid Price X [(127 – As)/100]

Where A = 0.0274 when specified smoothness is
1000mm/km

Where A = 0.0218 when specified smoothness is 1250
mm/km

Where s = smoothness value measured as per 401.7.1

When the measured smoothness value exceeds the specified value by 50 percent or more the LOT so measured shall be corrected, at the Contractor's expense, to comply with Tables 401.7.1E or Table 401.7.1M.

401.13.3 - When a LOT of HMA pavement does not meet the density requirements of 401.7.2, the price shall be adjusted as follows:

**TABLE 401.13.3 ADJUSTMENT OF CONTRACT
PRICE FOR PAVEMENT DENSITY NOT WITHIN
TOLERANCE OF DENSITY**

Percent of Density	Percent of Contract Price to be Paid
Greater than 96%	*
92% to 96%	100
91%	98
90%	96
89%	92
88%	88
Less Than 88%	*

*The Division will make a special evaluation of the material and determine the appropriate action.

401.13.4 - When a LOT of HMA pavement is determined to be statistically non-conforming in accordance with criteria 'B' of Section 401.7.3, the Division will review the plans and project records to determine if there is an acceptable explanation for this deficiency. If it is determined that a deficiency does exist, one of the following adjustments may be used. If the deficiency is less than $\frac{3}{4}$ inch (19 mm), the Division may choose to accept the material at a price equal to the bid price times the ratio of the average thickness divided by the specified thickness. If the deficiency is $\frac{3}{4}$ inch (19 mm) or greater, the Division may require that an additional lift of material [specified to the nearest $\frac{1}{4}$ inch (6 mm) of the deficiency] be placed at the Contractor's expense. Retesting of the overlay will be at the expense of the Contractor in accordance with MP 109.00.20.

SECTION 402

HOT-MIX ASPHALT SKID RESISTANT PAVEMENT

402.1-DESCRIPTION:

This work shall consist of constructing a Hot-Mix Asphalt (HMA) wearing course in accordance with the requirements of 401 with the following exceptions and additions:

402.2-MATERIALS:

The coarse aggregate shall consist of gravel, slag, or other acceptable polish resistant aggregate, or combinations thereof, meeting the requirement of Subsections 703.1 through 703.3, except as amended in this subsection.

When stone or gravel is specified in the contract, the coarse aggregate shall consist of gravel or other acceptable polish resistant aggregate, or combination thereof meeting the requirements of 703.1 through 703.3, except as amended in this subsection. When slag is specified in the contract, the coarse aggregate shall be slag meeting the requirements of 703.3, except as amended in this subsection.

The coarse aggregate or blends thereof shall have a minimum of 80 percent two-face fracture, and, except for those carbonate rocks which may be designated as acceptable polish resistant aggregate, the portion obtained on the #4 (4.75 mm) sieve shall contain no more than 15 percent carbonate particles. Acceptable dolomite may be used alone or as a part of a coarse aggregate blend on roadways with an ADT of 10,000 or less. On roadways exceeding 10,000 ADT, acceptable dolomite may be used only as a part of the coarse aggregate blend and shall not exceed 50% of that blend.

The total shale (determined by MP 703.00.27), coal and other lightweight deleterious material (determined by ASTM C123) and friable particles (determined by MP 703.01.20) shall not exceed three percent. The total thin and elongated pieces shall not exceed five percent.

402.3-FINE AGGREGATE:

Fine aggregate shall meet the requirements of 702.3.

402.4-MIXING:

The skid resistant paving mix shall be type designated on the plans.

402.5-PAY ITEMS:

* Sequence number

** Type of Aggregate

SECTION 403 THROUGH 404 - BLANK

SECTION 405
SURFACE TREATMENTS

405.1-DESCRIPTION:

This work shall consist of the construction of a wearing course, composed of bituminous material and aggregate, in one or more applications upon the completed and accepted base course or existing surface, in accordance with these Specifications and in reasonably close conformity with the lines, grades, thicknesses, and cross sections shown on the Plans or established by the Engineer.

The type of surface treatment will be indicated on the Plans.

405.2-MATERIALS:

The materials shall meet the requirements of the following Subsections of Division 700:

<u>MATERIALS</u>	<u>SUBSECTION</u>	<u>KIND OR GRADATION</u>
Coarse Aggregate	703.1-4	56, 6, 7, 78, 8 or 9
Liquid Asphalt (Rapid Curing Type)	705.2	RC-250 or RC-800
Liquid Asphalt (Medium-Curing Type)	705.3	MC-250 or MC-800
Asphalt Emulsion	705.4	AEM-2, AEM-3, SS-1, SS-1h, or MS-2
* Cationic Emulsified Asphalt	705.11	CMS-1, CSS-2, or CSS-1h

* May be used with aggregate other than gravel only if the aggregate-asphalt combination meets requirements of ASTM D 1664 for the dry aggregate coating test.

Unless otherwise directed by the Engineer, any of the above types or grades of bituminous material may be used.

CONSTRUCTION METHODS

405.3-WEATHER AND SEASONAL LIMITATIONS:

Weather and seasonal limitations shall be as prescribed in 403.3.

405.4-EQUIPMENT:

Equipment shall be as prescribed in 403.4.

405.5-PREPARING AND REPAIRING EXISTING SURFACE:

This operation shall be performed as prescribed in 401.

405.6-CLEANING AND SWEEPING:

When called for, this work shall be in accordance with 403.5.

405.7-APPLICATION OF BITUMINOUS MATERIAL:

This operation shall be performed as prescribed in 401, except as modified. The bituminous material shall be applied to the prepared surface at the rate specified in 405.12.

Except when required to maintain traffic, surface treatment operations shall be done upon the full width of the section.

New bases shall receive a prime coat as specified in 409 and shall be allowed to thoroughly cure before starting surface treatment operations.

405.8-APPLICATION OF AGGREGATE:

Immediately following each application of bituminous material, aggregate at the rate or rates called for in 405.12 shall be spread with the spreader in such a manner that the entire area being treated is uniformly covered. Trucks spreading aggregate shall be operated so that bituminous material will be covered before the wheels pass over it. Additional aggregate shall be spread if necessary, and hand spreading shall be done to cover areas inaccessible to the spreading equipment. When directed by the Engineer, the aggregate shall be dried or moistened as required.

405.9-BROOMING AND ROLLING:

Immediately following spreading of each layer of aggregate, the entire surface of the aggregate shall be broomed with a broom drag to insure uniform distribution of the aggregate. As soon as the broom dragging operation is completed, the rolling operation shall begin and continue until the aggregate is keyed into the bitumen. If so ordered by the Engineer, rolling shall be continued at proper intervals for several days. Any area that tends to ravel shall be repaired and rerolled. Rolling shall be parallel to the centerline and shall begin at the edges of the treatment and progress toward the center; on superelevated curves, rolling shall begin at the low edge of the curve and continue the entire width of the treatment, each trip uniformly overlapping the preceding trip.

Rolling shall cease before the aggregate is crushed to any appreciable extent. Rollers shall be the type and weight specified in 405.4. The number of rollers shall be sufficient to obtain compaction to the satisfaction of the Engineer. Water, to prevent adhesion of the bituminous material to the roller wheels, shall not be used in excessive amounts. The use of fuel oil, paraffin oil, and

405.12.3

kerosene on rollers or other equipment, for the purpose of preventing material from picking up or sticking, is prohibited.

405.10-JOINTS:

The longitudinal construction joints between adjacent lanes shall be kept clean of material foreign to the type of surface being treated. The joints shall be constructed without overlaps or gaps between the materials.

The transverse joint at the end of successive sections or lanes shall be covered with paper to prevent overlapping of the bituminous material. Following its use, the paper shall be removed and disposed of satisfactorily.

405.11-PROTECTION OF PAVEMENT AND TRAFFIC CONTROL:

This work shall be done as prescribed in [409.8](#).

405.12-SEQUENCE OF OPERATIONS AND QUANTITIES OF MATERIALS:

The quantities and kinds of materials to be used and the sequence of applications and operations for the various treatments shall be as follows. The quantities shown are the rates per square yard (meter).

Maximum quantities of bituminous material shall be used only when the old surface is open or porous. For blast furnace slag aggregate, 91 percent of the aggregate quantities shown shall be used and the quantity of bituminous material shall be increased to a maximum of 10 percent.

405.12.1-Type A-Light Seal:

- i. Clean and sweep.
- ii. Apply 0.15 to 0.20 gal. (0.7 to 0.9 liters) of bituminous material.
- iii. Spread immediately 8 to 10 lb. (4.4 to 5.5 kg) of # 9 aggregate.
- iv. Broom drag and roll immediately.

405.12.2-Type B-Single Surface Treatment:

- i. Clean and sweep.
- ii. Apply 0.2 to 0.3 gal. (0.9 to 1.4 liters) of bituminous material.
- iii. Spread immediately 10 to 20 lb. (5.5 to 11 kg) of # 8 aggregate.
- iv. Broom drag and roll immediately.

405.12.3-Type C-Double Surface Treatment:

- i. Clean and sweep.
- ii. Apply 0.25 to 0.35 gal. (1.1 to 1.6 liters) of bituminous material.
- iii. Spread immediately 25 lb. (13.5 kg) of # 7, 78, or 8 aggregate.
- iv. Broom drag.
- v. Roll tightly.
- vi. Apply 0.20 to 0.25 gal. (0.9 to 1.1 liters) of bituminous material.
- vii. Spread immediately 10 to 15 lb. (5.5 to 8 kg) of # 8 aggregate (# 9 aggregate if directed by the Engineer.)
- viii. Alternately roll and broom drag.

405.13-METHOD OF MEASUREMENT:

No materials shall be removed from the Project for any purpose until the operation has been completed and the quantities of materials incorporated into the operations have been determined, except when authorized by the Engineer.

The quantities of work done will be measured as follows:

The quantity of "Surface Treatment Aggregate" & "Patching & Leveling Aggregate" shall be measured by the ton (megagram) of material complete in place and accepted.

The number of tons (megagrams) of "Surface Treatment Aggregate" & "Patching & Leveling Aggregate" shall be determined by the total of the weights shown on receipted railroad freight bills with materials are shipped by rail; by actual measured displacement of barges certified by the producer when water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total and weigh slips for each vehicle load weighed on an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor, except that truck scales are not required where the material is weighed at properly calibrated automatic batching plant facilities which are equipped with digital print-out equipment. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions. The Division may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales or from the digital printout of the weights, is correct.

Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales.

A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time, date, truck identification and project number. Provision shall be made for constant zero compensation and further provision shall be made so that the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

The weight of all surface moisture in the aggregate will be deducted from the pay quantity.

The quantity of "Bituminous Material" shall be the number of gallons (liters)

408.2

incorporated into the completed work, which volume will be measured as prescribed in 109.1.

The quantity of "Cleaning and Sweeping" will be measured and paid for as provided in 403. Where a surface treatment is placed upon a base constructed as an item in the same contract, the conditioning and cleaning and sweeping of the base shall be considered as a part of the construction of the base and no additional compensation will be allowed for "Cleaning and Sweeping".

When items for maintaining traffic are included in the Contract, they will be measured and paid as provided in 636.

405.14-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

405.15-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
405001-*	SURFACE TREATMENT AGGREGATE, **	TON (MEGAGRAM)
405002-*	PATCHING AND LEVELING AGGREGATE, **	TON (MEGAGRAM)
405003-*	BITUMINOUS MATERIAL	GALLON (LITER)

* Sequence number

** Type of Aggregate

406 through 407 - BLANK

**SECTION 408
TACK COAT**

408.1-DESCRIPTION:

This work shall consist of preparing and treating an existing bituminous or concrete surface with bituminous material, and cover aggregate when called for on the Plans, in accordance with these Specifications and in reasonably close conformity with the lines shown on the Plans or established by the Engineer.

408.2-MATERIALS:

Materials shall meet the requirements of the following Subsections of Division 700:

MATERIALS	SUBSECTION	KIND OR GRADATION
Coarse Aggregate	703.1-4	7, 8, 8,9 or 10
Fine Aggregate	702.6	
Asphalt Emulsion		SS-1, SS-1h, CBAE Primer, AEM-1 RS-1 or MS-1
*Cationic Emulsified Asphalt	705.11	CMS-1, CRS-1, CSS-1, CSS-2, or CSS 1h
Water	715.7	

* May be used with aggregates other than gravel only if the aggregate asphalt combination meets the requirements of ASTM D 1664 for the dry aggregate coating test.

Unless otherwise indicated on the Plans or directed by the Engineer, any of the above types or grades of bituminous material may be used.

CONSTRUCTION METHODS

408.3-WEATHER RESTRICTIONS:

Tack coat shall be applied only when the weather and existing surface are satisfactory to the Engineer and when the temperature of the surface is 40° F (4° C) or above. When the surface temperature is less than 50° F (10° C), care must be exercised to assure that the tack coat "breaks" prior to the application of the asphalt concrete. When the surface temperature is 50° F (10° C) or above, the asphalt material may be asphalt emulsion or cutback asphalt.

408.4-EQUIPMENT:

Equipment shall include a power broom and power blower, a broom drag, equipment for heating bituminous material, a self-powered bituminous material pressure distributor, and an aggregate spreader. Equipment shall also include scrapers, hand brooms, shovels, and other equipment as may be necessary to thoroughly clean the base or surface. Equipment shall conform to the applicable requirements prescribed in 403.4.

408.5-PREPARED AND REPAIRING BASE OR EXISTING SURFACE:

No tack coat shall be applied until breaks, holes, depressions, and other irregularities in the base or existing surface have been repaired and cured sufficiently to permit the tack coat to be placed in a uniform application.

Patching and leveling material may be plant or road mixed. Hand patching will be permitted where necessary.

408.6-CLEANING AND SWEEPING:

When called for, this work shall be done as specified in 403.5.

408.7-APPLICATION OF BITUMINOUS MATERIAL:

Except when required to maintain traffic, the work shall be done on the full width of the section.

After the base or surface has been cleaned, when called for, and is in a dry condition, the bituminous material shall be applied by means of a pressure distributor. The rate of application of bituminous material shall be as specified in 408.11. Application temperatures of the bituminous material shall be within the range specified in Division 700 for the particular material being used. Asphalt emulsion, type SS-1 and SS-1h, and cationic emulsified asphalt types CSS-1 and CSS-1h, shall be diluted by the addition of water when directed by the Engineer.

The tack coat shall not precede the work of placing the subsequent surface course to such an extent that the treated surface will be injured during the interim. No patching and leveling or surface courses of any type shall be applied to the tacked surface until the bituminous material is thoroughly cured and dry. Tack coat shall not be applied over newly placed patching and leveling courses. However, to facilitate construction, minor (spot) areas that have been tacked, patched and leveled may be retacked and the quantity so used will be included for payment as part of the normal tack coat operation. The intent of the two preceding sentences, in conjunction with the next to the last paragraph of 401.20, is (1) to provide one tack coat application on the existing surface, although two applications, one over and one under, for minor (spot) patching and leveling areas, are permitted as indicated above, and (2) to limit payment for such operations to one application of the tack coat upon the existing surface for the entire project.

The surfaces of sidewalks, curbs, other structures, and trees adjacent to the area being treated shall be protected in such a manner as to prevent their being spattered or marred. Material used for such protection shall be removed and disposed of in a satisfactory manner. The distributor shall not be cleaned or discharged within the right-of-way, into borrow pits, or so as to pollute or block water courses.

408.8-APPLICATION OF COVER AGGREGATE:

When called for by contract documents or when directed by the Engineer, application of bituminous material shall be followed immediately with an application of clean dry aggregate at the rate specified in 408.11.

The aggregate shall be spread with spreaders. Immediately after the application of aggregate, the entire surface shall be broomed with a broom drag in order to insure uniform distribution of the aggregate.

408.9-JOINTS:

This operation shall be performed as prescribed in 405.10.

408.10-PROTECTION OF THE PAVEMENT AND TRAFFIC CONTROL:

The Contractor shall be responsible for the protection of the surface against damage by their equipment and personnel. Traffic shall not be permitted on any part of the work under construction until the treatment has cured sufficiently to prevent raveling or picking up under traffic. The applicable provisions of 636 shall apply for regulating traffic.

408.11-SEQUENCE OF OPERATIONS AND QUANTITIES OF MATERIALS:

The sequence of operations and quantities of materials to be used shall be as specified unless otherwise indicated on the Plans. The quantities shown are rates per square yard (meter).

- i. Clean and sweep.
- ii. Apply 0.20 to 0.30 gal. (0.9 to 1.4 liters) of bituminous material.
- iii. Spread 10 to 15 lb. (5.5 to 8 kg) of aggregate.

When bituminous material is specified for use as tack coat without tack coat aggregate, the quantity of bituminous material may be reduced at the option of the Engineer.

408.12-METHOD OF MEASUREMENT:

No materials shall be removed from the Project for any purpose until the operation has been completed and the quantities of materials incorporated into the operations have been determined, except when authorized by the Engineer.

The quantities of work done will be determined as follows:

The quantity of "Tack Coat Aggregate" shall be measured by the ton (megagram) of material complete in place and accepted.

The number of tons (megagrams) of "Tack Coat Aggregate" shall be determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail; by actual measured displacement of barges certified by the producer when water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor, except that truck scales are not required where the material is weighed at properly calibrated automatic batching plant facilities which are equipped with digital print-out equipment. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or

408.14

other appropriate agencies of the State or its political subdivisions. The Division may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales or from the digital printout of the weights, is correct.

Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales.

A digital recorder shall be required on all truck scales. The digital recorder shall produce a print record of the gross, tare and net weights, and the time, date, truck identification and project number. Provision shall be made for constant zero compensation and further provision shall be made so that the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

The weight of all surface moisture in the aggregate will be deducted from the pay quantity.

The quantity of "Bituminous Material" for tack coat shall be the number of gallons (liters), prior to dilution in the field, incorporated into the completed work and will be measured as prescribed in 109.1.

The quantity of "Cleaning and Sweeping" will be measured and paid for as provided in 403.5.

When items for maintaining traffic are included in the Contract, they will be measured and paid as provided in 636.

408.13-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

408.14-PAY ITEMS:

408002-*	BITUMINOUS MATERIAL	(MEGAGRAM) GALLON (LITER)

* Sequence number

** Type of Aggregate

SECTION 409 PRIME COAT

409.1-DESCRIPTION:

This work shall consist of preparing and treating an existing surface with bituminous material, and cover aggregate if required, in accordance with these Specifications and in reasonably close conformity with the lines shown on the Plans or established by the Engineer.

409.2-MATERIALS:

Materials shall meet the requirements of the following Subsections of Division 700:

MATERIALS	SUBSECTION	KIND OR GRADATION
Coarse Aggregate	703.1-4	# 7, 8, 9 or 10
Asphalt Emulsion	705.4	CBAE Primer or AEM-1, SS-1, or SS-1h
Cathionic Emulsified Asphalt	705.11	CSS-1, or CSS-1h

Unless otherwise directed by the Engineer, any of the above types or grades of bituminous material may be used.

SS-1, SS-1h, CSS-1 and CSS-1h may be diluted with water.

CONSTRUCTION METHODS

409.3-WEATHER RESTRICTIONS:

Weather restrictions shall be as prescribed in 403.3.

409.4-EQUIPMENT:

The equipment shall conform to the requirements specified in 408.4.

409.5-PREPARATION OF SURFACE:

The surface to be primed shall be shaped to the required grade and section, shall be free from all ruts, corrugations, segregated material or other irregularities, and shall be uniformly compacted immediately prior to the application of the bituminous material. The cleaning shall be done by the use of tools and equipment, as may be required, in such a manner as to thoroughly remove all mud, dirt, or any other foreign materials. The sweeping of the surface shall be just sufficient to expose the pattern of the coarse aggregate. Reconditioning and cleaning and sweeping shall be done for a minimum width of one foot (300 mm) on each side beyond the width of the surface being treated. Material cleaned from the surface shall be removed and disposed of as directed by the Engineer.

409.7

409.6-APPLICATION OF BITUMINOUS MATERIAL:

Except when required to maintain traffic, the work shall be done on the full width of the section.

Bituminous material shall be heated within the temperature limits specified in Division 700 for the particular type of material being used and shall be applied to the width of the section to be primed by means of a pressure distributor in a uniform, continuous spread. The rate of application of bituminous material shall be as specified in 409.9.

Care shall be taken that the application of bituminous material at the junctions of spreads is not in excess of the specified amount. Excess bituminous material shall be squeegeed from the surface. Skipped areas or deficiencies shall be corrected. Building paper shall be placed over the end of the previous applications, and the joining application shall start on the building paper. Building paper used shall be removed and disposed of in a satisfactory manner.

When traffic is maintained, one-way traffic will be permitted on the untreated portion of the roadbed. As soon as the bituminous material has been absorbed by the surface and will not pick up, traffic shall be transferred to the treated portion and the remaining width of the section shall be primed. The quantities, rate of application, temperatures, and areas to be treated shall be approved before application of the prime coat.

The surfaces of sidewalks, curbs, other structures, and trees adjacent to the area being treated shall be protected in such a manner as to prevent their being spattered or marred. The material used for such protection shall be removed and disposed of in a satisfactory manner. The distributor shall not be cleaned or discharged within the right-of-way, into borrow pits, or so as to pollute or block water courses.

409.7-APPLICATION OF COVER AGGREGATE:

Cover aggregate shall be used only when called for by the Plans or when needed to absorb excess bituminous material or protect the primed surface from traffic when directed by the Engineer. Spreading shall be accomplished by aggregate spreaders in such a manner that the tires of the spreader at no time contact the uncovered and newly applied bituminous material.

If directed, the cover aggregate shall be moistened with water to eliminate or reduce the dust coating of the aggregate. Moistening shall be done the day before the use of the aggregate.

Immediately after the cover aggregate is spread, any deficient areas shall be covered by additional material. After the application of the cover aggregate, the surface where specified shall be lightly broomed or otherwise maintained.

Maintenance of the surface shall include the distribution of cover aggregate over the surface to absorb any free bituminous material and cover any area deficient in cover coat material. The maintenance shall be conducted so as not to displace imbedded material. Excess material shall be swept from the entire surface by means of rotary brooms. The surface shall be swept at the time determined by the Engineer.

409.8-PROTECTION OF PAVEMENT AND TRAFFIC CONTROL:

The Contractor shall be responsible for the protection of the surface against damage by their equipment and personnel. Traffic shall not be permitted on any part of the work under construction until the treatment has cured sufficiently to prevent raveling or pickup under traffic. The applicable provisions of 636 shall apply for regulating traffic.

409.9-SEQUENCE OF OPERATIONS AND QUANTITIES OF MATERIALS:

The sequence of operations and quantities of materials to be used shall be as shown below, unless otherwise indicated on the Plans. The quantities shown are rates per square yard (meter).

- i. Clean and Sweep until top of base stone is exposed.
- *ii. Apply 0.30 to 0.60 gal. (1.4 to 2.7 liters) of bituminous material.
- iii. Spread 10 to 20 lb. (5.5 to 8 kg) of aggregate.

*Bituminous applications may be made in two operations if necessary.

409.10-METHOD OF MEASUREMENT:

No materials shall be removed from the Project for any purpose until the operation has been completed and the quantities of materials incorporated into the operation have been determined, except when authorized by the Engineer.

The quantities of work done will be determined as follows:

The quantity of "Prime Coat Aggregate" shall be the number of tons (megagrams) of aggregate incorporated in the completed and accepted work.

The number of tons (megagrams) of "Prime Coat Aggregate" shall be determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail; by actual measured displacement of barges certified by the producer when water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor, except that truck scales are not required where the material is weighed at properly calibrated automatic batching plant facilities which are equipped with digital print-out equipment. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales

409.12

or from the digital printout of the weights, is correct. Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales.

A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare, and net weights, and the time, date, truck identification and project number. Provision shall be made for constant zero compensation and further provision shall be made so that the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours; while the equipment is being repaired.

The weight of all surface moisture in the aggregate will be deducted from the pay quantity.

The quantity of "Bituminous Material" for prime coat shall be the number of gallons (liters) incorporated into the completed work and will be measured as prescribed in 109.1.

The quantity of "Cleaning and Sweeping" will be measured and paid for as provided in 403.5. Where a prime coat is placed upon a new base constructed in the same contract, the conditioning and cleaning and sweeping of the base shall be considered as a part of the construction of the base and no additional compensation will be allowed for "Cleaning and Sweeping".

When items for maintaining traffic are included in the Contract, they will be measured and paid for as provided in 636.

409.11-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

409.12-PAY ITEMS:

410 THROUGH 411 -BLANK

SECTION 412

WINTER GRADE ASPHALT PATCHING MIXTURE

412.1-DESCRIPTION:

This work shall consist of preparing a mixture of aggregate and bituminous material suitable for stockpiling and remaining workable for a period of six months.

412.2-MATERIALS:

412.2.1-Bituminous Material: The material shall conform to the requirements of 705.1, Winter Grade Cut-Back Asphalt.

412.2.2-Aggregate: The aggregate shall consist of crushed stone, crushed gravel, or slag, meeting the requirements of 703.1, 703.2 and 703.3 respectively, and sand meeting the requirements of 702.3. The gradation of the final mixture shall be as follows:

<u>SIEVE SIZES</u>	<u>PERCENT PASSING</u>
½ in.(12.5 mm)	100
¾ in. (9.5 mm)	85-100
# 4 (4.75 mm)	25-65
# 8 (2.36 mm)	10-20
# 100 (150 µm)	0-5

CONSTRUCTION METHODS

412.3-MIXING PROPORTIONS:

Samples of bituminous materials and aggregates intended to be used shall be furnished the Division who will advise the mixture proportions to be used.

412.4-PREPARATION OF MIX:

The asphaltic binder shall be heated to 150° to 175° F (66 to 79° C), care being taken to prevent local overheating. The aggregate and bituminous material shall be measured separately and accurately to the proportions in which they are to be mixed. After the aggregate and binder have been combined, they shall be thoroughly mixed until all particles of the aggregate are coated. At no time shall the finished mixture be at a temperature greater than 150° F (66° C).

The constituents shall be combined in such proportions as to produce a

412.5

mixture conforming to the following composition by weight:

	<u>Limestone or Gravel Percent</u>	<u>Slag Percent</u>
Total Mineral Aggregate	94.0-95.0	92.5- 94.0
Winter Grade Cut Back Asphalt	5.0-6.0	6.0-7.5

When the correct percentage of bituminous material is established for a given aggregate, this quantity shall not vary more than minus 0.1 percent or plus 0.3 percent.

412.5-METHOD OF MEASUREMENT:

The quantities of work done will be measured in tons (megagrams) of "Winter Grade Bituminous Patching Mixture", F.O.B. vendor's plant or stockpile, or the Division's stockpile as designated.

The number of tons (megagrams) of "Winter Grade Bituminous Patching Mixture" shall be determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail; by actual measured displacement of barges certified by the producer when water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor , except that truck scales are not required where the material is weighed at properly calibrated automatic batching plant facilities which are equipped with digital print-out equipment. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions. The Division may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales or from the digital printout of the weights, is correct.

Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales. A digital recorder shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time, date, truck identification and project number. Provision shall be made for constant zero compensation

and further provision shall be made so that the scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

412.6-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item listed below, which price and payment shall be full compensation for furnishing and handling all the materials incorporated in the mixture.

412.7-PAY ITEM:

SECTION 415 REMOVING EXISTING PAVEMENT SURFACE

415.1 - DESCRIPTION:

This work shall consist of preparing the existing pavement for the placement of additional courses of pavement as shown on the plans.

415.2 - CONSTRUCTION METHODS:

The equipment for removing the existing pavement shall be a power operated planing machine or grinder. The equipment shall be capable of accurately establishing profile grades along each edge of the machine within plus or minus 1/4 inch (6 mm) by referencing from the existing pavement and able to maintain accurate depth of cut and cross-slope.

The cuttings shall be expeditiously removed from the pavement behind the planing machine or grinder. Stockpiling of material on the project site will not be permitted unless otherwise noted on the plans or approved by the Engineer.

The machine shall have a control system providing for uniformly varying the depth of cut while the machine is in motion to prevent cutting of or damage to drainage works, manholes or other appurtenances within the paved area.

The existing pavement shall be removed to the depth, width, grade and cross-section shown on the plans or as otherwise directed by the Engineer. The manner of performing the work shall be such that the pavement is not torn, gouged, shoved, broken or otherwise injured and such that the remaining pavement is suitable as a base for a bituminous concrete overlay, or suitable as a riding surface.

The removed pavement material shall become the property of the

415.5

Contractor.

Excess waste material resulting from the operation shall be removed and disposed of in a manner approved by the Engineer.

At the end of each working day, all equipment shall be removed to a location where it does not present a hazard to traffic, the pavement shall be cleaned by sweeping or flushing.

If the ground area is opened to traffic the following shall apply; at the end of each working day, any transverse vertical face shall be sloped so as not to present a hazard to traffic and any longitudinal vertical face shall not exceed 2 inches (50 mm).

415.3 - METHOD OF MEASUREMENT:

“Removing Existing Pavement Surface” shall be measured by the total number of square yards (meters) planed or ground, without regard to the number of passes or to the thickness of the material removed.

415.4 - BASIS OF PAYMENT:

The completed work as measured for removing existing pavement surface will be paid for at the contract unit price for the following contract item.

415.5-PAY ITEM:

ITEM	DESCRIPTION	UNIT
415005-*	REMOVING EXISTING PAVEMENT SURFACE	SQUARE YARD (METER)

* Sequence number

DIVISION 500 RIGID PAVEMENT

SECTION 501 PORTLAND CEMENT CONCRETE PAVEMENT

501.1-DESCRIPTION:

This work shall consist of a pavement composed of portland cement concrete, with or without reinforcement as shown on the Plans, constructed on a prepared subgrade or base course in accordance with these Specifications and in reasonably close conformity with the lines, grades, thicknesses, and typical cross sections shown on the Plans or established by the Engineer.

At the option of the Contractor, pavement shall be constructed with equipment utilizing fixed-forms or by the use of slip-form paving equipment.

Pozzolan materials (fly ash, ground granulated blast furnace slag and microsilica) conforming to the provisions of these specifications may be used as an additive to Portland Cement Concrete Pavement at the Contractor's option. These additives are not permitted when a blended hydraulic cement is used.

A water reducing admixture may be used at the Contractor's option. A water reducing admixture shall not be used in conjunction with a water reducing retarder.

501.2-MATERIALS:

Materials shall meet the requirements of Division 700, as follows:

MATERIAL	SUBSECTION
Portland Cement	701.1, 701.3
Air Entraining Admixture	707.1
*Fine Aggregate	702.1
Coarse Aggregate	703.1-4
Performed Elastomeric Joint Seals; Lubricant-Adhesive	708.2
Preformed Expansion Joint Filler	708.1.1 (Type 1), 708.1.2
Low Modulus Silicone Joint Sealant; Back-Up Material	708.4

501.2.1

MATERIAL	SUBSECTION
Pavement Reinforcement	709.4, 709.6
Coated Dowel Bars	709.15
Tie Bars	709.1
Joint Tie Bolt Assembly	709.7
Water	715.7
Water Reducer	707.3
Pozzolan Additives	707.4
Curing Materials	707.6-707.10

* NOTE: The use of limestone will not be permitted.

Shipping and Storage of Cement: Cement shall be shipped from pretested and approved bins at the mill or other terminal locations. Cement stored by the Contractor for a period longer than 90 days shall be retested before being used in the work. Cement failing to meet any of the specified requirements at any time prior to incorporation into the work will be rejected and removed from the work. Cements of different types shall be stored separately.

Shipping and Storage of Pozzolan Additives: Pozzolan additives shall be shipped from only those sources approved by the Division. Bulk pozzolan additives shall be stored at the job site in weatherproof bins. Pozzolan additives from different sources or from different lots at the same source shall be stored separately.

501.2.1-Recycled Pavement for use as Coarse Aggregate for Concrete:

501.2.1.1-The existing portland cement concrete pavement may be removed and crushed, when called for on the Plans. If asphaltic concrete resurfacing is present, the asphaltic concrete shall be removed before the portland cement concrete is crushed.

501.2.1.2-Any existing reinforcing steel encountered shall be removed from the existing pavement prior to or during the crushing operation and shall be disposed of by the Contractor.

501.2.1.3-The Contractor shall remove the pavement in a manner which excludes subgrade and base material to the maximum extent practical.

501.2.1.4-The pavement material shall be crushed to pass the 1½ in. (37.5 mm) sieve. Processing equipment shall include a No. 4 (4.75 mm) screen and

excessive fines in the crushed material shall be controlled by removal of fines passing the No. 4 (4.75 mm) screen.

501.2.1.5-Any excess material removed during processing shall be disposed of by the Contractor.

CONSTRUCTION METHODS

501.3-PROPORTIONING:

Prior to the start of construction, the Contractor shall design and submit to the Engineer for approval the proportions of materials, including admixtures, to be used which will result in a workable concrete having the properties enumerated below, including those of Table 501.3.1. The mix design, prepared in accordance with MP 711.03.23, shall include a statement giving the source of materials and certified test data from a Division approved laboratory demonstrating the adequacy of the mix design. The Contractor shall notify the Engineer of any change in the source of materials or the addition of admixtures during the process of the work since such change may necessitate a new mix design. The Contractor shall also state the \bar{A} value of the combined grading of the coarse aggregate, fine aggregate, and cement used in the mix design.

The combined grading of the coarse aggregate, fine aggregate, and cement used in the pavement concrete shall conform to the design mix \bar{A} plus or minus the tolerance specified in the following table for the coarse aggregate size used:

Coarse Aggregate Size No.	Design Mix \bar{A} Tolerance
357 or 467	± 0.35
57 or 67	± 0.25

\bar{A} is the values of total solids (coarse aggregate, fine aggregate and cement). The grading of the total solids shall be determined by the Contractor at least once each production day. Should the moving average of any five consecutive grading test results of the total solids have an \bar{A} outside the specified mix design tolerance limits, production shall be discontinued until appropriate corrections are made. Corrections shall be made either in the proportions of the concrete (the mix design), the gradation of the aggregates, or the storage and loading of the aggregate, as the Contractor may elect.

501.3.1

TABLE 501.3.1 {ENGLISH}			
Minimum 28-Day Design Strength	Minimum Cement Factor	Maximum Water Content	Standard Size of Coarse Aggregate
psi	Bags/ cu. Yd.	Gal. Per Cu. Yd. of concrete	Number
3,000 Compressive or 500 Flexural*	6**	33	357, 467 57 or 67
TABLE 501.3.1 {METRIC}			
Minimum 28-Day Design Strength	Minimum Cement Factor	Maximum Water Content	Standard Size of Coarse Aggregate
Mpa	kg per cubic meter	Liters per cubic meter of concrete	Number
20.7 Compressive or 3.5 Flexural*	335 kg**	163.4	357, 467 57 or 67

*NOTE: Flexural strength when tested by the third point method.

**NOTE: An equal volume of a pozzolanic additive may be substituted for portland cement up to the following maximum amount. Only one pozzolanic additive is permitted in a mix design.

MATERIAL**QUANTITY**

Fly Ash	1 bag
Ground Granulated Blast Furnance Slag	3 bags
Microsilica	½ bag

MP 711.03.26 shall be used to control the cement factor in pavement concrete if the Contractor has a suitable means of verifying the minimum 28-day design strength, and providing a copy of the plan for verifying the strength is submitted to the Engineer. When MP 711.03.26 is used to control the cement factor in portland cement concrete pavements, then column two in Table 501.3.1 will be considered to contain a target cement factor instead of a

minimum cement factor.

The amount of entrained air in freshly mixed concrete shall be 7 percent plus or minus 2-½ percent.

Concrete shall have the consistency which will allow proper placement and consolidation in the required position. The optimum consistency shall be as indicated in Table 501.3.2.

TABLE 501.3.2 CONSISTENCY	
TYPE	OPTIMUM CONSISTENCY
	INCHES (mm) OF SLUMP
(a) For pavements when concrete is permitted to be placed using a slip form paver, where a low slump is required to maintain the prescribed geometry.	*1 in. (25 mm)
(b) For pavements supplied by travel mixers of central mixers where the concrete is struck off and consolidated entirely by mechanical equipment.	**2 in. (50 mm)
(c) For pavements and approaches supplied by travel, central or transit mixtures where the concrete is struck off and consolidated partially by hand labor.	**2 ½ in. (65 mm)

*The consistency shall be that which will allow a proper placement and consolidation of the concrete, and will permit the prescribed geometry to be maintained. The concrete will be rejected when the consistency exceeds 2 inches (50 mm).

**If the consistency exceeds the optimum plus ¾ in. (20 mm), the Contractor shall take immediate steps to reduce the slump of succeeding loads by making necessary adjustments in the mixture. The Contractor will be allowed a reasonable time for the trucks already on the road for a central mix or transit mix operation. Failure to comply will be cause for rejection of the concrete. If the consistency exceeds the optimum plus 2 inches (50 mm), the concrete will be rejected.

The approved mix design shall be subject to modification under the following conditions:

501.4

After the start of the first concreting operation and immediately after the specified consistency and entrained air have been established, three unit weight determinations shall be made from different batches and the average of the three determinations shall be considered the unit weight of the concrete. The actual yield shall be adjusted as required to correct the actual yield to correspond to the theoretical.

During the progress of the work, the actual yield may be verified; and, if the yield based on a single unit weight determination should differ from the theoretical more than plus or minus two percent, two additional unit weight determinations shall be made from different batches and the average of the three determinations shall be considered the unit weight of the concrete. The actual yield shall be determined from the average unit weight, and the design mix shall again be adjusted as required to correct the actual yield to correspond to the theoretical.

In addition to the design mix adjustments specified above to correct for yield, other adjustments in the design mix proportions shall be made as necessary to maintain a plastic, workable mix with suitable finishing characteristics.

No change in the sources of material shall be made without prior approval of the Engineer.

Methods for determining the properties enumerated above shall be in accordance with 501.4.

501.4-TESTING:

501.4.1-Test Methods:

Slump of Portland Cement Concrete	AASHTO T 119
Air Content of Freshly Mixed Concrete	AASHTO T 152 AASHTO T 196 with MP 711.03.20 or AASHTO T 199 with MP 711.03.25
Unit Weight/Yield of Concrete	AASHTO T 121
Making and Curing Concrete Compressive Specimens	AASHTO T 23 with MP 601.04.20
Flexural Strength Test Specimens in the Field and Compressive Strength of Cylindrical Concrete Specimens	AASHTO T 22
Flexural Strength of Concrete	AASHTO T 22

Obtaining and Testing Drilled Core Specimens	AASHTO T 97
Obtaining and Testing Drilled Core Specimens	AASHTO T 24
Measuring Length of Drilled Concrete Cores	AASHTO T 148
Total Moisture Content of Aggregate by Drying	AASHTO T 255
Sampling Fresh Concrete	AASHTO T 141
Sieve Analysis of Fine and Coarse Aggregates	AASHTO T 27 and T 11
Determination of Free Moisture in Fine Aggregate Using 20 Gram or 26 Gram "Speedy Moisture Tester"	MP 702.00.20
Sampling Aggregates	ML 26
Determination of Total Solids in Concrete	MP 601.03.51

501.4.2-Contractor's Quality Control: Quality control of the portland cement concrete is the responsibility of the Contractor as designed in MP 601.03.50. The Contractor shall maintain equipment and qualified personnel, including at least one certified portland cement concrete technician who shall direct all field inspection, sampling and testing necessary to determine the magnitude of the various properties of concrete governed by the Specifications and shall maintain these properties within the limits of this Specification. The Contractor's personnel who conducts the field sampling and testing shall be a certified Portland Cement Concrete Inspector. The quality control plan designated by MP 601.03.50 shall be submitted to the Engineer at the preconstruction conference.

Item C5 of the Table 2.2.1 of MP 601.03.50 shall not apply to the Contractor's process control requirements for pavement concrete. Work shall not begin until the plan is reviewed for conformance with the contract documents.

501.4.3-Acceptance Testing: Acceptance sampling and testing of portland cement concrete is the responsibility of the Division, except for furnishing of necessary materials.

Strength, as used in this Specification, is only one indicator of the durability of the portland cement concrete. Evaluation of a pavement may include evaluation of the freeze-thaw durability, including scaling

501.4.4

characteristics, abrasion resistance, density, and such other factors as the Division deems appropriate to the pavement.

501.4.4-Testing for Opening Pavement to Traffic: A minimum of three sets of three concrete specimens (beams or cylinders) each shall be made for each day's paving operation. The three sets of specimens shall be treated in the following manner to determine when the pavement represented may be put into service under the provisions of 501.18, except that said determination and the action permitted shall in no way affect the treatment of concrete as specified in 501.21.1 and 501.14.

One specimen from each of the three sets shall be tested at age four days and the results averaged to establish the test value. If the test value complies with the Specification, the portion of pavement which is aged four days may be put into service.

In the event Specification compliance has not been verified at age four days, one specimen from each of the three sets shall be tested at age six days and the results averaged to establish the test value. If the test value complies with the specifications the portion of pavement which is aged six days may be put into service.

In the event Specification compliance has not been verified at age six days, one specimen of the remaining specimen from each of the three set shall be tested at age eight days and the results averaged to establish the test value. If the test value complies with the Specification, the portion of pavement that has aged eight days may be put into service.

In the event the test value determined at age eight days does not comply with the Specification, the test values determined at ages four, six, and eight days may be plotted on a graph and a line drawn through the points in such a manner as to establish the age-strength relationship. The line may be projected to age 28 days, and if the projection indicates specification design strength compliance prior to age 28 days, then the pavement may be put into service at the age at which specification compliance is indicated.

When high early strength cement is used, the first test value may be established at age three days and all succeeding values established at 24 hour intervals.

501.4.5-Compressive Strength Tests for Acceptance: Compressive strength test for acceptance will be in accordance with the requirements prescribed.

The compressive strength of concrete will be determined by testing cores which are taken in the manner described in 501.19.1. These cores will generally be the same as those taken to verify pavement thickness and described in 501.19.2.

The concrete shall be at least 28 days old before the cores are obtained and generally the cores will be obtained before the concrete is 90 days old. Compressive strength test results obtained at time of test will be used in statistical analysis to verify compliance with the strength requirement.

501.5.1

Compressive strength test data will be analyzed statistically and the average compressive strength minus one standard deviation shall be equal to or greater than the 28 day design strength ($\bar{X} - 1SD \geq 28\text{-day design strength}$, see graphical illustration below). Also, the average of any consecutive five strength tests representing a portion of the pavement concrete shall be equal to or greater than the 28-day design strength. Strength test data which are determined to be statistical outliers will be omitted from the computations which derive the statistical parameters (\bar{X} and σ), and the sublots of pavement represented by outliers which occur in the region of low strength will be separately evaluated and disposed of in a manner deemed suitable by the Engineer.

NORMAL DISTRIBUTION CURVE (501.4.5)

If the specimens fail to meet the minimum standards of acceptance set forth above, the concrete in question will be considered substandard and disposition will be determined by the Division in accordance with 105.12 of these Specifications. If one or more sets of consecutive five strength tests should fail to comply with the Specifications and all other requirements of the Specifications are met, the portion of concrete represented by consecutive five sets which fail to comply will be considered substandard and the specified action will be related to the portion of concrete thus defined.

501.5-EQUIPMENT AND TOOLS:

Equipment and tools necessary for handling materials and performing all parts of the work shall be approved by the Engineer as to design, capacity, and mechanical condition. The equipment shall be at the job site sufficiently ahead of the start of construction operations to be examined. Any equipment not maintained in satisfactory working order, or which is proved inadequate, shall be improved or new equipment substituted, as directed by the Engineer.

501.5.1-Field Laboratory: Portland cement concrete shall be supplied by a plant which has been certified by the Division as meeting all requirements of the governing Specifications and as having the facilities necessary to ascertain and control the quality of the product in accordance therewith.

501.5.2

A testing facility or laboratory, as described below, shall be provided within reasonable proximity of the concrete batch patch.

The laboratory shall have inside dimensions which provide a minimum working area of 26 ft. (8 meters) in length by 6 ft. (2 meters) in width (examples which would generally meet this requirement are a building with inside dimensions of 12 by 13 ft.(3.5 by 4 meters), or a trailer with dimensions of 8 by 30 ft. (2.5 by 9 meters)). The laboratory shall be furnished and maintained with adequate ventilation, heat, light, water, sinks and drainage, electrical or gas outlets, or both, work table, shelves, and supply cabinets.

The laboratory shall be supplied with the equipment and materials listed below and shall be maintained in such a condition that the equipment will meet the applicable requirement of ASTM or AASHTO.

- i. Hot plate, gas or electric.
- ii. Large oven, gas or electric.
- iii. Pressure air meter or volumetric air meter (Rollameter).
- iv. Slump cone and rod.
- v. Unit weight container, $\frac{1}{2}$ cu. ft. (0.014 m^3)
- vi. Solution balance, 20 kg. capacity, one gram increments.
- vii. Balance, minimum capacity 1,000 g., 0.1 g. increments.
- viii. Platform scale, 100 kg. capacity, 10 g. increments.
- ix. Thermometer, armored type.
- x. Standard Gilson shaker or equivalent, with screens.
- xi. Ro-Tap shaker or equivalent, with 8-in. (200 mm) round screens.
- xii. Wire basket and container for weighing aggregates under water.
- xiii. Sample splitters for fine and coarse aggregates.
- xiv. Equipment for determining specific gravity of sand.
- xv. Miscellaneous items (including rubber hammer, mason's trowels, approximate dimensions 4 in. and 8 in. (100 mm and 200 mm), square point shovel, small and large sugar scoops, heavy galvanized pail approximate 14 qt. (13 liter) capacity, aggregate sample pans, brushes, flashlight, glassware, steel straightedge approximate dimensions 18 by 2 in. (450 by 50 mm)), and such expendable supplies as are necessary for the tests to be made.
- xvi. "Speedy Moisture Tester", 20 g. or 26 g. capacity.

501.5.2-Batching Plant Equipment:

501.5.2.1-General: The batching plant shall include bins, weighing hoppers, and scales for the fine aggregate and for each size of coarse aggregate. If cement is used in bulk, a separate bin, hopper, and scale for cement shall be included. The weighing hopper shall be properly sealed and vented to preclude dusting during operation. If fly ash is used in the concrete, a separate bin shall be included.

501.5.2.2-Bins and Hoppers: Bins with adequate separate compartments

for fine aggregate and for each size of coarse aggregate shall be provided in the batching plant.

501.5.2.3-Scales: The scales for weighing aggregates and cement shall conform to the requirements of 109.1.

Scales shall be inspected and sealed as often as the Engineer may deem necessary to assure their continued accuracy. The Contractor shall have on hand not less than ten 50 pound (22.68 kg) test weights for frequent testing of all scales.

Batching plants equipped to proportion aggregates and bulk cement by means of automatic weighing devices may be used.

501.5.2.4-Water Measuring Equipment: Unless the water is weighed, the water measuring equipment shall include an auxiliary tank from which the measuring tank shall be filled. The measuring tank shall be equipped with an outside tap and valve to provide for checking the setting, unless other means are provided for readily and accurately determining the amount of water in the tank. The volume of the auxiliary tank shall be at least equal to that of the measuring tank.

501.5.2.5-Admixture Dispenser: A positive, automatic mechanical method shall be used for adding admixtures in solution.

501.5.3-Mixers and Hauling Equipment:

501.5.3.1-General: Mixers at the site of construction or at central point, truck mixers, and hauling equipment shall conform to the requirements specified. Each mixer shall have attached in a prominent place a manufacturer's plate showing the capacity of the drum in terms of volume of mixed concrete and the speed of rotation of the mixing drum or blades.

501.5.3.2-Mixers: Mixing shall be in a mixer capable of combining the aggregates, cement, and water into a thoroughly mixed and uniform mass within the specified mixing period. The mixer shall be equipped with a timing device which will automatically lock the discharge level when the drum has been charged and release it at the end of the mixing period. The device shall be equipped with a bell or other suitable warning device adjusted to give a clearly audible signal each time the lock is released. In case of failure of the timing device, the mixer may be used for the balance of the day while it is being repaired.

The mixers shall be cleaned at suitable intervals. The pickup and throw-over blades in the drum or drums shall be repaired or replaced when they are worn down $\frac{3}{4}$ in. (20 mm) or more. The Contractor shall (1) have available at the job site a copy of the manufacturer's design showing dimensions and arrangements of blades in reference to original height and depth, or (2) provide permanent marks on blades to show points of $\frac{3}{4}$ in. (20 mm) wear from new

501.5.3

conditions. (Holes of ¼ in. (6 mm) diameter near each end and at a midpoint of each blade are recommended.)

501.5.3.3-Truck Mixers and Truck Agitators: Truck mixers used for mixing and hauling concrete, and truck agitators used for hauling central-mixed concrete, shall conform to the requirements of AASHTO M 157.

501.5.3.4-Nonagitator Trucks: Bodies of nonagitating hauling equipment for concrete shall be smooth, mortartight, metal (non-aluminum) containers and shall be capable of discharging the concrete at a satisfactorily controlled rate without segregation. The concrete shall be discharged from the bottom of the container. If discharge of concrete is accomplished by tilting the body, the surface of the load shall be retarded by a suitable baffle. Covers shall be provided when needed for protection.

501.5.4-Finishing Machine: The finishing machine shall be designed and operated to strike off, consolidate, and obtain a smooth finish. The top of the forms, if used, shall be kept free from accumulation by an effective device attached to the machine, and the travel of the machine on the forms shall be maintained true.

501.5.5-Vibrators: For full width vibration of concrete paving slabs, vibrators may be either the surface pan type or the internal type with either immersed tube or multiple spuds. They may be attached to the spreader or the finishing machine, or may be mounted on a separate carriage. They shall not come in contact with the joint, load transfer devices, subgrade, or side forms. The frequency of the surface vibrators shall not be less than 3,500 impulses per minute, and the frequency of the internal type shall not be less than 5,000 impulses per minute for tube vibrators and shall be between 5,000 and 10,000 impulses per minute for spud vibrators.

When spud type internal vibrators, either hand operated or attached to spreaders or finishing machines, are used adjacent to forms, they shall have a frequency of not less than 3,500 impulses per minute.

Other types of vibrators may be used when shown they perform the function intended.

501.5.6-Concrete Saw: When sawing joints is elected or specified, the Contractor shall provide sawing equipment, adequate in number of units and power to complete the sawing to the required dimensions and at the required rate for preventing uncontrolled cracking. A standby saw and ample supply of saw blades shall be maintained at the site of the work at all times during sawing operations. The Contractor shall provide adequate artificial lighting facilities for night sawing. All of this equipment shall be on the job both before and continuously during concrete pavement.

501.5.7-Forms: Straight side forms shall be of adequate design to support

the paving train and to provide the proper pavement section without horizontal joints. Flexible or curved forms of proper radius shall be used for curves of 200-ft. (60 meter) radius or less. Flexible or curved forms shall be of a design acceptable to the Engineer. Forms shall be provided with adequate devices for secure setting and shall have an attachment provision for forming the keyed joint between lanes. When in place they shall withstand, without visible springing or settlement, the impact and vibration of consolidating and finishing equipment. Forms with battered top surfaces, and bent, twisted, or broken forms shall be removed from the job. The top face of the forms shall not vary from a true plane more than $\frac{1}{8}$ in. (3 mm) in 10 ft. (3 mm in 3 meters), and the upstanding leg shall not vary more than $\frac{1}{4}$ in. (6 mm) from a plane normal to the subgrade. The forms shall contain provisions for locking the ends of abutting form sections together tightly, and for secure setting.

501.5.8-Edging Tools: Edging tools shall have $\frac{1}{4}$ in. (6 mm) radius for all edges except outside edges, which shall have a $\frac{3}{4}$ in. (20 mm) radius.

501.6-PREPARATION OF GRADE, SETTING FORMS, AND CONDITIONING OF SUBGRADE OR BASE:

501.6.1-Preparation of Grade: After the roadbed has been graded and compacted, as provided in 207 or 228, the grade shall be trimmed approximately to correct elevation, extending the work at least 2 ft. beyond each edge of the proposed concrete pavement to provide support for the fixed-forms or the slip-form paver tracks.

501.6.2-Setting Forms:

501.6.2.1-Base Support: The foundation under the forms shall be hard and true to grade so that the form, when set, will be firmly in contact for its whole length and at the specified grade. Any grade which at the form line is found below established grade shall be filled to grade with granular material, in lifts of $\frac{1}{2}$ in. (13 mm) or less for a distance of 18 in. (450 mm) on each side of the base of the form, and thoroughly compacted. Imperfections or variations above grade shall be corrected by tamping or by cutting as necessary.

501.6.2.2-Form Setting: Forms shall be set sufficiently in advance of the point where concrete is being placed. After the forms have been set to correct grade, the grade shall be thoroughly tamped, mechanically or by hand, at both the inside and outside edges of the base of the forms. Form sections shall be tightly locked, free from play or movement in any direction. The forms shall not deviate from true line by more than $\frac{1}{4}$ in. (6 mm) at any point. Excessive settlement or springing of forms under the finishing machine will not be tolerated. Forms shall be cleaned and oiled prior to the placing of concrete.

501.6.2.3-Grade and Alignment: The alignment and grade elevations of

501.6.3

the forms shall be checked and corrections made by the Contractor prior to placing the concrete. When any form has been disturbed or any grade has become unstable, the form shall be reset and rechecked.

501.6.3-Conditioning of Subgrade or Base: The base shall be brought to the proper cross section and plan grade within the tolerances specified for the final course underlying the pavement. The finished grade shall be maintained in a smooth and compacted condition until the pavement is placed. The grade shall be constructed sufficiently in advance of the paver to prevent delays.

Unless waterproof subgrade or base course cover material is specified, the subgrade or base course shall be uniformly moist when the concrete is placed.

501.7-HANDLING, MEASURING, AND BATCHING MATERIALS:

The batch plant site, layout, equipment and provisions for transporting material shall be such as to assure a continuous supply of material to the work.

Stockpiles shall meet the requirements of 106.5. Aggregates shall be handled, hauled, and stored in such a manner which will minimize segregation, avoid contamination, and secure a uniform grading of the material within the specified gradation band. All aggregates produced or handled by hydraulic methods, and washed aggregates, shall be stockpiled or binned for draining a sufficient time to eliminate excess water. Aggregates which have dried below a saturated surface-dry condition shall be wet down the night previous to their use, and sprinkled during the day to obtain saturated surface-dry condition.

The fine aggregate and each size of coarse aggregate shall be separately weighed into hoppers in the respective amounts approved by the Engineer for the job mix. Cement shall be measured by weight. Separate scales and hoppers shall be used for weighing the cement, with a device to indicate positively the complete discharge of the batch of cement. Bulk fly ash shall be stored in weatherproof bins. Batching shall be so conducted as to result in weights within a tolerance of one percent for cement and two percent for aggregates.

Water may be measured either by volume or by weight. The accuracy of measuring the water shall be within a range of error of not over one percent.

All admixtures shall be measured into the mixer with an accuracy of plus or minus three percent. Admixtures shall be introduced into the mix simultaneously with the mixing water. When more than one type of admixture is used they shall be introduced into the mix separately.

Handling, measuring, and batching of materials for volumetric batching and continuous mixing shall, in addition to the preceding requirements, conform to the applicable requirements specified in AASHTO M 241.

501.8-MIXING CONCRETE:

Concrete may be mixed at the site or a central mix plant, or it may be produced by volumetric batching and continuous mixing as designated in AASHTO M 241. When permitted in the Contract, concrete may be mixed in a truck-mixer.

Ready-mixed concrete shall be mixed and delivered in accordance with the

requirements of AASHTO M 157 paragraphs 10 and 11, or AASHTO M 241 paragraphs 7 and 8, except as otherwise specified.

The required minimum mixing time for an individual mixer may be specified as that which, as shown by tests made at the Contractor's expense, will result in satisfactory mixing. Performance tests and the acceptable ranges in test results within each batch from the three different samples are given in Table 501.8. The mixing time shall not be less than 75 seconds. Where mixer performance tests are not made, minimum mixing time shall be 60 seconds plus 15 additional seconds for each cubic yard (meter) of concrete being batched in excess of one cubic yard (meter).

The mixer shall be operated at a drum speed recommended by the manufacturer. Any concrete mixed less than the specified time shall be discarded and disposed of by the Contractor at his expense. The mixer shall not be operated in excess of its nominal capacity as shown on the manufacturer's rating plate.

The mixing of concrete shall continue for the required mixing time after all ingredients, except water and admixture if added with water, are in the mixing compartment of the mixer before any part of the batch is released. The batch shall be so charged into the drum that a portion of the mixing water shall enter in advance of the cement and aggregates. The flow of water shall be uniform and all water shall be in the drum by the end of the first 15 seconds of the mixing period. The throat of the drum shall be kept free of such accumulations as may restrict the flow of materials into the drum.

The time elapsing from the time water is added to the mix until the concrete is deposited in place at the site of the work shall not exceed 30 minutes when the concrete is hauled in non-agitating trucks, nor shall it exceed 60 minutes when hauled in transit-mix trucks or truck agitators.

The addition of water after the completion of the initial mixing operation will not be permitted, except that when concrete is delivered in transit-mix trucks additional water may be added to the batch materials and additional mixing (minimum of 20 revolutions at mixing speed) performed to modify the consistency to meet the specified requirements, provided all these operations are performed within 45 minutes after the initial mixing operation and provided the maximum number of revolutions at mixing speed is not exceeded. Concrete that is not within the specified consistency limits at the time of placement shall not be used.

No concrete shall be mixed, placed or finished when the natural light is insufficient unless an adequate artificial lighting system is used.

TABLE 501.8
PERFORMANCE TESTS AND ACCEPTABLE RANGES FOR
CENTRAL MIXED CONCRETE

*TEST CRITERIA	**PERMISSIBLE RANGES WITHIN BATCH FROM THREE SAMPLES
	Plant
Slump, in inches (mm)	2.25 (60 mm)
Air content, percent by volume of concrete sample	2.0
Weight per cu. ft. Of plastic concrete, in lbs.	4.0 (64.8 mm)
Coarse aggregate retained on No. 4 sieve expressed as a percent of three-sample average weight retained	11.0

* Tests to be made in accordance with applicable AASHTO or ASTM Methods.

** Each property measured shall not exceed the permissible range in more than one out of seven batches.

NOTE: Mixer performance data shall be based on three concrete samples per test batch, taken at the mixer during discharge from approximately 1/6, 1/2 and 5/6 points of the batch discharge.

Determination of coarse aggregate uniformity within the batch where concrete ingredients are batched from separate stockpiles of more than one size of coarse aggregate shall be made using sieves of appropriate size to identify the quantity of coarse aggregate coming from each of the separate stockpiles.

A minimum of seven production batches of concrete shall be tested for the proposed minimum mixing time unless the Engineer determines, on the basis of prior tests on concrete produced with the equipment and materials to be used, that a different number of batches is adequate for the purpose. When any change occurs in size of the batch, the operating process, conditions affecting mixing or hauling, the ingredients of the concrete, or other conditions which will affect the quality of the concrete incorporated in the pavement, an additional seven production batches of concrete shall be tested.

501.9-PLACING CONCRETE:

The concrete shall be deposited on the grade in such manner as to require as little rehandling as possible. Unless transit-mix trucks, agitators, or other hauling equipment units are equipped with means for discharge of concrete without segregation, the concrete shall be unloaded into a spreading device and mechanically spread on the grade in such manner as to prevent segregation of the materials. Placing shall be continuous between transverse joints without the use of intermediate bulkheads. Necessary hand spreading shall be done with shovels, not rakes. Workers shall not be allowed to walk in the fresh concrete with boots or shoes coated with earth or foreign substances.

The pavement shall be constructed by placing two longitudinal traffic lanes full width in one operation unless otherwise indicated in the Contract. Lane-at-a-time construction will be permitted in variable width sections or other sections designated by the Engineer.

When the Contract permits lane-at-a-time construction and concrete is to be placed adjoining a previously constructed lane of pavement and mechanical equipment other than finishing equipment will be operated upon the existing lane, that lane shall first meet the requirements of 501.18. If only finishing equipment is carried on the existing lane, paving in adjoining lanes may be permitted after three days.

Concrete shall be deposited as near to expansion and contraction joints as possible without disturbing them, but shall not be dumped from the discharge bucket onto a joint assembly unless the bucket is well centered on the joint assembly.

When using a slip-form paver, or combination of pavers, they shall be designed to spread, consolidate, screed and float-finish the freshly placed concrete in one complete pass of the paving train in such manner that a minimum of hand finishing will be necessary to provide a dense and homogenous pavement in conformance with the Plans and Specifications. The equipment shall vibrate the concrete for the full width and depth of the strip of pavement being placed. Such vibration shall be accomplished with vibrating tubes or arms working in the concrete or with a vibrating screed or pan operating on the surface of the concrete. No appreciable edge slumping of the in-place concrete will be allowed, and, if necessary, forms shall be trailed behind the paver to prevent slumping. If training forms are used, they shall be rigidly supported laterally.

Slip-form pavers shall be operated with as nearly a continuous forward movement as possible and all operations of mixing, delivering and spreading concrete shall be so coordinated as to provide uniform progress. If, for any reason, it is necessary to stop the forward movement of the paver, the vibratory and tamping elements shall also be stopped immediately. No tractive force shall be applied to the machine, except that which is controlled from the machine.

Placement to essential full width is required when slip-form paving methods are used. However, the Engineer may permit lane-at-a-time placement on variable width, small, or otherwise restricted sections using standard forming methods detailed elsewhere in these Specifications.

501.10

Concrete shall be thoroughly consolidated against and along the faces of all forms and along the full length and on both sides of all joint assemblies by means of vibrators inserted in the concrete. Vibrators shall not be permitted to come in contact with a joint assembly, the grade, or a side form. In no case shall the equipment mounted vibrators be operated when the equipment is not moving in the forward direction. All equipment mounted vibrators shall be stopped, either manually or automatically, when the equipment stops its forward progress.

Should any concrete materials fall on, or be worked into, the surface of a completed slab, they shall be immediately removed.

501.10-STRIKE-OFF OF CONCRETE AND PLACEMENT OF REINFORCEMENT:

Following placing, the concrete shall be struck off to conform to the cross section shown on the Plans and to an elevation such that when the concrete is properly consolidated and finished, the surface of the pavement will be at the elevation shown on the Plans. When reinforced concrete pavement is placed in two layers, the entire width of the bottom layer shall be struck off to such length and depth that the sheet of fabric or bar mat may be laid full length on the concrete in its final position without further manipulation. The reinforcement shall then be placed directly upon the concrete, after when the top layer of the concrete shall be placed, struck off, and screeded. All portions of the bottom layer which have been placed more than 30 minutes without being covered by the top layer shall be replaced at the Contractor's expense. When reinforced concrete pavement is placed in one layer, the reinforcement may be positioned in advance of concrete placement, or it may be placed in the plastic concrete, after spreading, by mechanical or vibratory means. When reinforcement is specified, it shall be placed in the center portion of the pavement. Variation in the depth of reinforcement is permitted, but the minimum concrete cover shall be one-third of the plan depth of the pavement.

Reinforcement shall be as designated on the Plans and shall be free from dirt, oil, paint, grease, and loose rust which could impair bond of the steel with the concrete.

501.11-JOINTS:

Joints shall be constructed of the type and dimensions and at the locations required by the Plans.

501.11.1-Longitudinal Joints: Deformed steel tie bars or tie bolt assemblies shall be placed perpendicular to the longitudinal joints. They shall be placed by suitable mechanical equipment or rigidly secured by suitable supports to prevent displacement. Tie bars shall not be painted, coated, or enclosed in tubes or sleeves.

All longitudinal joints shall be sawed normal to the surface of the pavement with a suitable concrete saw. Construction of longitudinal joints shall be in accordance with the appropriate requirements, as follows:

- i. When the longitudinal joint separates adjacent pavement lanes or slabs that are poured at the same time, sawing of longitudinal joints shall be performed between 4 and 24 hours after the pavement is placed and before any equipment and vehicles are allowed on the pavement. The saw cut shall be to a minimum depth of one-third of the plan depth of pavement; the width shall be $\frac{1}{4}$ in. (6 mm), with a tolerance of plus or minus $\frac{1}{16}$ in. (2 mm) The groove shall be cleaned and cured in accordance with 501.11.8 and sealed in accordance with 501.16.
- ii. When the longitudinal joint separates adjacent pavement lanes or slabs that are poured separately (lane-at-a-time construction), the longitudinal joint may be sawed, and cleaned in accordance with 501.11.8, just prior to sealing in accordance with 501.16. The saw cut shall be to a depth of 1 in. (25 mm), plus $\frac{1}{4}$ in. (6 mm); the width shall be $\frac{1}{4}$ in. (6 mm) plus or minus $\frac{1}{16}$ in. (2 mm) If the joint is not sealed soon after the sawing operation, the groove shall be protected in accordance with 501.11.8 until just prior to the sealing operation.

When formed joints are permitted, they shall be formed while the concrete is in the plastic state by a suitable mechanically operated device. The joints shall be formed to the dimensions and lines indicated on the Plans. The groove shall be sealed in accordance with 501.16.

The longitudinal joints shall extend to and contact the transverse joints, if any.

501.11.2-Transverse Expansion Joints: The expansion joint filler shall be one piece, continuous from form to form, shaped to the subgrade and to the cross section of concrete. The filler shall be depressed $\frac{1}{2}$ in. (13 mm) below the surface of the pavement.

The expansion joint filler shall be held in a vertical position. Finished joints shall not deviate more than $\frac{1}{4}$ in. (6 mm) in the horizontal alignment from a straight line at right angles to the centerline of the pavement. No plugs of concrete will be permitted anywhere within the expansion space.

501.11.3-Transverse Contraction Joints: Transverse contraction joints shall consist of planes of weakness created by sawing or forming grooves, normal to the grade, in the surface of the pavement as shown on the Plans. These contraction joint grooves shall be centered, within 1 in. (25 mm) of the mid-length of the dowels, over the coated dowel bars specified.

Unless otherwise specified or authorized, all transverse contraction joint grooves shall be constructed in two steps as described, resulting in the dimensions detailed on the Plans and at the spacing and locations shown on the Plans. Grooves shall be cured in accordance with 501.11.8 and sealed in accordance with 501.16.

501.11.4

As soon as feasible after placing the concrete, the contraction joints shall be sawed or formed to the dimensions shown on the Plans. Initial sawing of joints shall commence as soon as the concrete has hardened sufficiently to permit sawing without excess raveling, usually 4 to 24 hours. All joints shall be initially sawed before uncontrolled shrinkage cracking takes place, but no later than 24 hours after placement of concrete. If necessary, initial sawing operations shall be continuous, through day and night, regardless of weather conditions. In general, all joints should be sawed in sequence. The initial sawing of any joint shall be omitted if cracking occurs at or near the joint location prior to the time of sawing. Initial sawing of a joint shall be discontinued when a crack develops ahead of the saw. If extreme conditions exist which make it impractical to prevent erratic cracking by early sawing, the contraction joints shall be formed in the plastic concrete.

When the concrete has hardened sufficiently, but no earlier than 72 hours after placement of the concrete, final or second-step sawing shall be performed. The sawing operation shall consist of widening the contraction joint to the depth and width shown on the Plans and shall be conducted in such a manner as to provide smooth and uniform joint faces.

After the joints have been cleaned, following second-step sawing, they shall be inspected for irregularities. Any excessive irregularities of the joint faces, including spalled, cracked and honey combed areas or otherwise loose, unsound concrete, which would prevent proper contact between the sides of the seal and the joint faces, shall be corrected prior to installation of the seal. The loose, unsound concrete shall first be removed to the satisfaction of the Engineer. The damaged area shall then be repaired in an acceptable manner. For elastomeric seals, when a joint opening is larger than the specified width plus the allowable tolerance, which can be attributed to inaccurate sawing rather than contraction of the abutting slabs, the joint shall be "built up" with an acceptable epoxy resin mortar mix to its proper width. The concrete surface shall be clean and dry at the time of placing the epoxy mortar. All joint repair work shall be done at the Contractor's expense and to the satisfaction of the Engineer.

When formed joints are permitted, they shall be effected by an approved mechanically operated device to the dimensions specified and while the concrete is still in the plastic state. The grooves shall be filled as specified or, if forming is in lieu of initial sawing, shall be later widened by second-step sawing.

Random cracking at transverse contraction joints, as described in 501.11.7, shall be sealed with silicone sealant.

501.11.4-Transverse Construction Joints: Transverse construction joints shall be installed when there is an interruption of more than 30 minutes in the concreting operations. No construction joint shall be installed within 10 ft. (3 meters) of an expansion or contraction joint. If sufficient concrete has not been placed to form a slab at least 10 ft. (3 meters) long, the excess concrete back to the last proceeding joint shall be removed.

Construction joints shall be constructed in a manner similar to transverse

contraction joints. The groove for installation of the sealant shall have the same dimensions as for transverse contraction joints and shall be sealed in accordance with 501.16.

501.11.5-Coated Dowel Bars: Coated dowel bars (load transfer reinforcement) shall be used across all transverse joints as shown on the Plans. Dowels shall be located at mid-depth of the pavement with a tolerance of placement within plus or minus 1 in. (25 mm) of the lateral and vertical positions shown on the Plans. Dowels shall be aligned parallel to the centerline and surface of the pavement with a tolerance for such alignments within plus or minus ¼ in. (6 mm) per dowel.

Dowels shall be held in position in the pavement by means of metal supports that remain in the pavement, except as noted. The combination of dowel bars and all the various components of the metal supports at a joint is commonly referred to as the dowel assembly or load transfer unit. Welding of dowels to the supports, to achieve a fixed end condition, shall be performed in accordance with the details shown on the Plans. For dowel assemblies at contraction and construction joints, welding of dowels to any member of the supports will not be permitted within the middle one-third of the dowel's length. The longitudinal misalignment of one end of a dowel assembly with respect to the other end in achieving a perpendicular alignment with the centerline of the pavement shall not exceed 1 in. (25 mm). Acceptance of a type of dowel assembly by the Division in no way relieves the Contractor of their responsibility for furnishing, as part of the assembly, coated dowel bars that meet the requirements of 709.15, nor does it relieve the Contractor of the Contractor's responsibility for placing and maintaining the assembly in its proper position and alignment during paving operations.

The mechanical implanting method of placing dowel bars is not permitted except when approved by the Engineer.

For coated dowel bar types that require a bond breaker, the bond breaking material, prequalified for use with that particular type coating, shall be carefully applied over the entire length of the bar just prior to placement of concrete unless an approved bondbreaker lubricant has been applied in the shop.

The free end of expansion joint dowels shall be provided with a close fitting metal cap or sleeve equipped with a stop to prevent closing during paving operations. A clearance of 1 in. (25 mm) shall be maintained between the closed end of the cap and the end of the dowel to accommodate future movement of the concrete slab.

501.11.6-Expansion Joints Around Structures: Expansion joints shall be formed by placing pre-molded expansion joint material about all structures and features projecting through, into or against the pavement. Unless otherwise indicated, such joints shall be ½ in. (13 mm) in width.

501.11.7-Random Cracks: Random cracks falling in an area 3 inches (75 mm) on either side of the center of the transverse contraction joint's dowel bars

501.11.8

shall be sawed for the full width, widening and deepening the crack to the dimensions of final or second-step sawing for transverse contraction joints, of the pavement slab and cleaned, just prior to sealing with silicone sealant.

If any random or uncontrolled crack occurs between 3 inches (75 mm) and 10 ft. (3 meters) from a doweled joint, the entire pavement within the lane where such crack occurs shall be removed for a distance of 10 ft. (3 meters) from the joint and replaced. If such cracking occurs on both sides of the same joint, the pavement shall be removed for a distance of 10 ft. (3 meters) in both directions. The dowel assembly or bars, as the case may be, shall be removed and replaced with a new dowel assembly. The new joint over the dowel assembly shall be initially formed by the use of a removable insert or by sawing and the joint later widened by second-step sawing for sealing in accordance with 501.16. The above described work shall be done at no additional cost to the Division.

501.11.8 – Curing Saw Joints: Immediately upon completion of the final sawing operation both vertical faces shall be completely free of dirt and dust; leaving a clean, dry, newly exposed concrete surface. Joints shall be cleaned by sandblasting each face with the nozzle held at an angle to the joint face and within 1 or 2 inches (25 to 50 mm) of the pavement. Sandblasting shall be done to a depth at which the sealant and backer rod are to be installed.

No sealant shall be placed unless temperature of the air and the pavement is 40° F (4° C) or higher.

501.11.8.1-Rope or Rod: After the joint is cleaned, acceptable rope or rod material which is non-metallic, inert, resilient, compressible, non-absorbent and non-shrinking shall be installed along the top of the joint, flush with the pavement surface, and shall also extend down the pavement edge to the bottom of the joint. The diameter of the rope or rod material shall be approximately 25 percent larger than the joint width.

The rope or rod material shall remain in the joint until just prior to the second-step sawing or, for longitudinal joints, until just prior to sealing. When sealing operations for transverse contraction or construction joints do not commence immediately after the second-step sawing and cleaning, a rope or rod approximately 25 percent larger than the joint width shall be installed as previously specified and shall remain in place until just prior to sealing.

501.11.9-Bridge Approach Expansion Joints for Jointed Pavement:

Construction of bridge approach expansion joints for jointed pavement shall be performed at the locations and in accordance with the details and requirements specified on the Plans. Construction of the concrete sub-slab may be Class B of 601 or pavement concrete. Construction of the bituminous concrete courses shall conform to the applicable requirements of 401.

501.12-FINAL STRIKE-OFF, CONSOLIDATION AND FINISHING:

501.12.1-Sequence: The sequence of operations shall be strike-off and consolidation, floating and removal of laitance, straight-edging, and final surface finish.

Any addition of water to the surface of the concrete to assist in the finishing operations will not be permitted. When conditions are such that unusually rapid drying is occurring, an atomized mist may be used to prevent the rapid evaporation of water from the concrete surface during the final finishing.

501.12.2-Finishing at Joints: The concrete adjacent to joints shall be consolidated or firmly placed without voids or segregation against the joint material, under and around all load transfer devices, joint assemblies, and other features designed to extend into the pavement. Concrete adjacent to the joints shall be mechanically vibrated as required in 501.9.

The operation of the finishing machine over the joints shall not cause segregation of concrete and damage to or misalignment of joints.

501.12.3-Machine Finishing: The concrete shall be distributed as soon as placed. It shall immediately be struck off and screeded by the finishing machine.

Vibrators for full width vibration of concrete paving slab shall meet the requirements of 501.5.5. If uniform and satisfactory density of the concrete is not obtained by the vibratory method at joints, along forms, at structures, and throughout the pavement, the Contractor will be required to furnish equipment and methods which will produce pavement conforming to the Specifications.

501.12.4-Hand Finishing and Consolidation: Hand finishing will not be permitted except under the following conditions:

In the event of breakdown of the mechanical equipment, hand methods may be used to finish the concrete already deposited on the grade.

Areas of narrow widths or irregular dimensions, where operation of mechanical equipment is impractical, may be finished by hand.

Concrete, as soon as placed, shall be struck off and screeded. A portable screed shall be used.

If reinforcement is used, a second screed shall be provided for striking off the bottom layer of concrete.

The surface screed shall be at least 2 ft. longer than the maximum width of slab to be struck off. It shall be sufficiently rigid to retain its shape under all working conditions, and constructed either of metal or of other suitable material shod with metal.

Consolidation shall be attained by the use of suitable vibrator or other equipment.

In operation the screed shall be moved forward on the forms in the direction the work is progressing, using a combined longitudinal and transverse shearing motion, so manipulated that neither end is raised from the side forms during the striking process. This shall be repeated until the surface is of uniform texture, true to grade and cross section, and free from porous areas.

501.12.5

501.12.5-Floating: After the concrete has been struck off and consolidated, it shall be further smoothed, trued, and consolidated by means of a mechanical longitudinal float, except when waived by the Engineer.

If necessary, following one of the methods of floating described, long-handled floats may be used to smooth and fill in open textured areas in the pavement. Care shall be taken not to work the crown out of the pavement during the operation.

501.12.5.1-Mechanical Method: The mechanical longitudinal float shall be maintained in proper working order. At the beginning of each day's operation the float shall be checked and adjusted to the design crown of the pavement. A small amount of mortar shall be carried ahead of the float at all times. The forward speed shall be adjusted so that succeeding strokes of the float shall overlap on each transverse trip. The float shall pass over each area of pavement sufficient number of times until the surface shows no variation from straightedge requirements, but excessive operation over a given area will not be permitted. All excess water, laitance, or other foreign material shall be wasted over the side forms on each pass.

Pipe float devices may be used for longitudinal floating when slipform paving.

501.12.5.2-Alternative Mechanical Method: As an alternate to the above method, the Contractor may use a machine composed of a cutting and smoothing float, or floats, suspended from and guided by a rigid frame. The frame shall be carried by at least four visible wheels riding on, and constantly in contact with, the side forms.

501.12.5.3-Hand Method: The hand-operated longitudinal float shall be not less than 12 ft. in length and 6 inches (150 mm) in width, properly stiffened to prevent flexibility and warping. The float shall be operated from foot bridges resting on the side forms and spanning but not touching the concrete.

The float shall be worked with a sawing motion, while held in a floating position parallel to the road centerline and passing gradually from one side of the pavement to the other. Movement ahead along the centerline of the pavement shall be in successive advances of not more than one-half the length of the float. Any excess water, laitance, and other foreign material shall be wasted over the side forms on each pass.

501.12.6-Straightedge Checking and Surface Correction: After the floating has been completed and the excess water removed, but while the concrete is still plastic, the surface of the concrete shall be tested for trueness with a 10-ft straightedge. The Contractor shall furnish and use a 10-ft straightedge swung from handles at least 3 ft. longer than one-half the width of the slab. The straightedge shall be held in contact with the surface in successive positions parallel to the road centerline and the whole area gone over

from one side of the slab to the other as necessary. Advance along the road shall be in successive stages of not more than one-half the length of the straightedge. Any depressions found shall be immediately filled with freshly mixed concrete, struck off, consolidated, and refinished. High areas shall be cut down and refinished. Special attention shall be given to assure that the surface across joints meet the requirements for smoothness. Straightedge testing and surface corrections shall continue until the entire surface is found to be free from observable departures from the straightedge and the slab conforms to the required grade and cross section.

501.12.7-Final Finish: The surface of the mainline pavement, acceleration and deceleration lanes, ramps, and all traveled ways shall be given a final groove finish. The tool used shall produce a groove that is approximately 3/32 in. (2 mm) wide. The depth of the groove shall be 1/8 in. (3 mm) to 3/16 in. (5 mm) and spaced approximately 1/2 in. (13 mm) center to center. The grooves shall be formed in a direction transverse to the centerline of the roadway. Adjacent strokes to establish the texture shall abut one another without appreciable overlap. Texturing shall be performed when the concrete surface is of such plasticity as to prevent excessive raveling (concrete too dry) or to prevent mortar from flowing back into the grooves (concrete too wet). All texturing shall be accomplished with a single pass of the tool.

501.12.8-Edging at Forms and Joints: Before the concrete has taken its initial set, the edges of the pavement along each side of the slab and on each side of all formed joints, except joints initially formed that will be later widened by second-step sawing, shall be rounded. A 3/4 in. (20 mm) radius edging tool shall be used for rounding outside edges and a 1/4 in. (6 mm) radius tool for other edges. A well defined and continuous radius shall be produced and a smooth, dense mortar finish obtained. The surface of the slab shall not be unduly disturbed by tilting the tool during use. Any tool marks shall be eliminated by brooming the surface without disturbing the radius. All concrete on top of the joint filler shall be removed.

All joints shall be checked with a straightedge before the concrete has set and all necessary corrections made if one side is higher than the other or if they are higher or lower than the adjacent slabs.

501.12.9-Station Numbers: The Contractor shall impress station numbers into the pavement before it takes its final set. The complete station number is to be marked each 100 ft. (20 meters) Where equalities in alignment occur, they shall be marked in the pavement in the same manner as they are shown on the Plans. The numerals shall be 3 to 4 inches (75 to 100 mm) in height and 1/4 in. (6 mm) in depth. The station numbers shall be placed parallel to the transverse joints, approximately 12 to 24 inches (300 to 600 mm) from the outside edge of the pavement. Station numbers shall be placed along the right edge of a two-lane highway, readable in the direction of increasing stations. On multi-lane highways, numbers shall be placed along the outside edge of the two

501.12.10

outside lanes of the roadway, readable in the direction of travel.

501.12.10-Protection Against Rain: In order that the concrete may be properly protected against the effects of rain before the concrete is sufficiently hardened, the Contractor shall have available at all times materials for the protection of the edges and surface of the unhardened concrete. Such protective materials shall consist of metal forms or wood planks having a nominal thickness of not less than 2 inches (50 mm) and nominal width of not less than the thickness of the pavement at its edge for protection of the pavement edges, and covering material such as burlap or cotton mats, curing paper, or plastic sheeting for protection of the surface. When rain appears imminent, all paving operations shall stop and all available personnel shall begin placing forms against the sides of the pavement and covering the surface of the unhardened concrete with the protective covering.

501.13-SURFACE TESTS:

The smoothness of the riding surface will be determined by the engineer using an inertial Profilometer or Mays Ride Meter calibrated to an inertial Profilometer. The smoothness testing will generally be accomplished within 30 days after the project is complete.

501.13.1 – Sampling Units: The pavement will be divided into sampling LOTS of 0.1 lane mile (0.16 lane kilometer) each. Each LOT shall exhibit a smoothness measurement, expressed in inches per mile (millimeters per kilometer).

501.13.2 – Smoothness Requirement: Each sampling unit shall exhibit a smoothness equal to or less than 65 inches per mile (1000 millimeters per kilometer). Sampling units exhibiting smoothness values greater than 65 inches per mile (1000 millimeters per kilometer) shall be paid for at an adjusted price as follows:

$$\begin{aligned}\text{Revised Unit Price} &= \text{UBP} - \left[\left(1.00 - \frac{\{127.86 - 0.429S\}}{100} \right) (0.18 \text{ UBP}) \right] \text{ ENGLISH} \\ &= \text{UBP} - \left[\left(1.00 - \frac{\{127.86 - 0.028S\}}{100} \right) (0.18 \text{ UBP}) \right] \text{ METRIC}\end{aligned}$$

Where UBP = Unit Bid Price

Where S = Smoothness in inches per mile (millimeters per kilometer)

When the measured smoothness value exceeds the specified value by 50 percent or more, the LOT shall be corrected to comply with these specifications.

501.14-CURING:

Immediately after the finishing operations have been completed and as soon

as marring of the concrete will not occur, the entire surface of the newly placed concrete shall be cured in accordance with one of the methods described. In all cases in which curing requires the use of water, the curing shall have prior right to the use of all water supplies. Failure to provide sufficient curing materials of whatever kind the Contractor may elect to use will be cause for immediate suspension of concreting operations. The concrete shall not be left exposed for more than 30 minutes between stages of curing or during the curing period.

Concrete placed in cold weather, as defined in 501.21, shall be cured a minimum of seven calendar days or when the Contractor provides suitable means for documenting the maturity (degree-hours) of the concrete, based on slab surface temperature, the curing period may be terminated when the curing has been maintained for a minimum of 7,000 degree hours.

During the curing period the surface temperature of the concrete shall not be allowed to fall below freezing. The Contractor shall be responsible for the quality of the concrete placed or cured, or both, during cold weather. Any concrete injured by frost action shall be removed and replaced at the Contractor's expense.

Polyethylene coated burlap and white polyethylene sheeting will be permitted as a curing application only on areas where intimate contact with the concrete surface can be obtained and maintained.

501.14.1-Burlap Mats: The surface of the pavement shall be entirely covered with the mats. The mats shall be of such length that they will extend at least twice the thickness of the pavement beyond the edges of the slab. The mat shall be placed so that the entire surface and both edges of the slab are completely covered. Before placing, the mats shall be thoroughly saturated with water. The mats shall be weighted down so as to remain in intimate contact with the surface covered and shall be maintained fully wetted and in position for 72 hours after the concrete has been placed, unless otherwise specified.

501.14.2-Waterproof Paper: The top surface and sides of the pavement shall be entirely covered with waterproof paper. The units shall be lapped at least 18 in. (450 mm). The paper shall be weighted down so as to remain in intimate contact with the surface. Each unit as laid shall extend at least twice the thickness of the pavement beyond the edges of the slab. Paper not manufactured in sizes providing this width shall be securely sewed or cemented together, the joints being securely sealed in such a manner that they do not open up during curing. The surface shall be thoroughly wetted before placing the paper. Curing shall continue for 72 hours after the concrete is placed, unless otherwise specified.

501.14.3-Straw Curing: When this type of curing is used, the pavement shall be cured initially with burlap or cotton mats, as specified above, until after final set of the concrete or, in any case, for 12 hours after placing the concrete. As soon as the mats are removed, the surface and sides of the pavement shall

501.14.4

be thoroughly wetted and covered with at least 8 inches (200 mm) of straw or hay, thickness to be measured after wetting. The straw or hay shall be kept thoroughly saturated with water for 72 hours after placing the concrete. If the straw or hay becomes displaced during the curing period, it shall be replaced to the original depth and saturated. Upon removal, the covering shall be disposed of in such a manner as to leave the right-of-way in a neat condition. The straw or hay shall not be burned on, or adjacent to, the pavement.

501.14.4-White Pigmented Impervious Membrane: The entire surface of the pavement shall be sprayed uniformly with white pigmented curing compound immediately after the finishing operation and before initial set has taken place, or, if the pavement is initially cured with burlap or cotton mats, it may be applied upon removal of the mats. The curing compound shall not be applied during rainfall.

Curing compound shall be applied under pressure by mechanical sprayers. The spraying equipment shall be of the fully atomizing type equipped with a tank agitator. The rate of application of the curing compound shall be as follows:

Pavement with Burlap Drag Finish-One Gallon Per Maximum of 150 sq. ft. (0.27 liters per square meter)

Pavement Requiring Groove Finish-One Gallon Per Maximum of 125 sq. ft. (0.33 liters per square meter)

At the time of use, the compound shall be in a thoroughly mixed condition with the pigment uniformly dispersed throughout the vehicle. During application the compound shall be continuously agitated. Hand spraying of odd widths or shapes and surfaces exposed by removal of forms will be permitted. Curing compound shall not be applied to the inside faces of joints to be sealed.

Should the film become damaged from any cause within the required curing period (72 hours after placement of concrete, unless otherwise specified), the damaged portions shall be immediately repaired with additional compound.

Upon removal of the side forms, the sides of the exposed slabs shall be protected immediately with a curing treatment equal to that provided for the surface.

501.14.5-White Polyethylene Sheeting or Polyethylene Coated Burlap:

The top surface and sides of the pavement shall be entirely covered with polyethylene sheeting or polyethylene coated burlap. Units shall be lapped at least 18 in. (450 mm) The covering shall be weighed down so as to remain in intimate contact with the surface covered. The covering shall extend at least twice the thickness of the pavement beyond the edges of the slab. The covering shall be maintained in place at least 72 hours after the concrete is placed, unless otherwise specified.

501.15-REMOVING FORMS:

Forms shall not be removed until at least 12 hours after placement of the concrete. Forms shall be removed carefully so as to avoid damage to the slab. As soon as the side forms have been removed, minor honeycombed areas shall be filled with mortar composed of one part cement to two parts fine sand and cured as outlined in one of the methods indicated above. Major honeycombed areas shall be removed and replaced. All areas or sections so removed shall be not less than 10-ft in length nor less than the full width of the traffic lane involved. Any remaining portion of the slab adjacent to the joints that is less than 10-ft in length shall also be removed and replaced. Slabs shall be cut by sawing full depth for removal.

501.16-SEALING JOINTS:

All transverse contraction and construction joints to be sealed shall have the preformed elastomeric seal installed or shall be filled with silicone sealer before the pavement is opened to traffic, including construction traffic, and as soon after completion of curing as is feasible.

All longitudinal joints shall be sealed with silicone sealant.

501.16.1-Silicone Sealant: Following forming, initial sawing and final or second-step sawing operations, the joints shall have been cleaned in accordance with 501.11.8. In preparation for sealing, all joints that have become contaminated since those forming or sawing operations shall be cleaned by wire brushing, sandblasting, or a high pressure water blast or by a combination of these methods.

Just prior to installing the back-up material, the joints shall be blown out with compressed air at a pressure of at least 90 psi (620 kPa) to remove all dust, loose particles and debris. Air compressors used for this purpose shall be equipped with traps capable of removing moisture and oil from the compressed air. A joint shall not be sealed until it is thoroughly clean and dry.

When recommended by the manufacturer, the vertical surfaces of joints shall be fully wetted by a primer. The primer and application, including all safety precautions, shall be as per the manufacturer's recommendations. The primer shall be allowed to dry tack-free prior to installation of the backer rod.

The back-up material shall be installed in the joint at the required depth. The silicone sealant shall then be applied from inside the joint in a manner which causes it to wet the joint faces and to reasonable close conformity with the required dimensions.

Immediately following placement of the sealant and before a skin forms, the sealant shall be tooled to force it against the joint faces and to provide a slightly concave surface with a depth of approximately 3 in. (6 mm) (at the center of the joint) below the pavement surface.

Any unreasonable deviation from the required joint or sealant dimensions will be just cause for rejection of the joint until satisfactory corrective measures are taken by the Contractor at no additional cost to the Division. Any failure of the joint material in either adhesion or cohesion will be cause for rejection of the joint, and the joint shall be repaired to the Engineer's satisfaction by the

501.16.2

Contractor at no additional cost to the Division.

Silicone sealant shall never be applied to frozen, dirty, wet, or damp concrete or during inclement weather conditions. Silicone sealant shall not be placed in the joints without the approval of the Engineer when the temperature at the surface of the concrete is less than 40° F (5° C).

501.16.2-Performed Elastomeric Seal: The dimensional requirements shall be as specified on the Plans. Joints shall be clean and dry at the time the elastomeric seal is installed. Just prior to installation of the seal, the lubricant-adhesive shall be applied to the joint faces or the sides of the seal, or both, to facilitate installation of the seal and to help secure the seal in place in the joint. The lubricant-adhesive shall be applied in such a manner as to cover both sides of the seal over the full area in contact with the joint faces. Any lubricant-adhesive that gets on top of the seal shall be immediately removed. Seals shall be installed in a substantially full compressed condition with the vertical axis of the seal parallel to the joint faces. Seals shall be installed in the joints to the depth shown on the Plans using suitable machines or tools that will not twist, curl, nick, notch, or otherwise damage the seal and that will insert the seal in such a manner that elongation of the seal shall not exceed five percent. The in-place seals shall be one-piece construction, without field or factory splices, for the full length of the joint. Any seal that is damaged during installation shall be removed and replaced with a new, undamaged seal. Any seal that is improperly installed or positioned in the joint or that shows more than five percent elongated following installation shall be removed and properly reinstalled or replaced.

501.17-PROTECTION OF PAVEMENT:

The Contractor shall protect the pavement and its appurtenances against both public traffic and the traffic caused by their own employees and agents.

This protection shall include watchmen to direct traffic, and the erection and maintenance of warning signs, lights, barricades, pavement bridges, crossovers, etc. The above shall be arranged so as not to interfere with public traffic on any lane intended to be kept open.

All damage to the pavement occurring prior to final acceptance shall be repaired or the pavement replaced, as the Engineer may direct.

501.18-OPENING PAVEMENT TO TRAFFIC:

If approved by the Engineer, the Contractor may open the pavement to traffic prior to 28 days after placement of concrete, provided tests conducted in accordance with 501.4.4 indicate the pavement has attained the 28-day design strength. If the Contractor wishes to open pavement to traffic prior to age 28 days, then all provisions for making test specimens and conducting and reporting the tests shall be handled by the Contractor at their expense. However, the Engineer may require that the pavement not be opened to traffic for a period of 28 days or longer, after placement of concrete, if conditions make it advisable to extend this time.

501.19-TOLERANCE IN PAVEMENT THICKNESS:

It is the intent of these Specifications that the pavement shall be constructed in substantial conformity with the specified thickness. Paving operations shall be directed toward obtaining an average and uniform thickness equal to or greater than the specified thickness.

For the purpose of establishing an adjusted unit price for pavement areas deficient in thickness, the thickness characteristics will be determined in accordance with the criteria specified.

501.19.1-Sampling Units and Sampling Requirements: The pavement thickness characteristics will be determined from an analysis of measurements made on cores. The cores will be taken by the Division with a frequency of one core from each sampling unit as defined and will be analyzed in accordance with [501.23.1.1](#).

501.19.1.1-Highway Proper: The total length of paving lane in linear feet in the highway proper shall be divided by 500 to determine the largest whole number which shall be the number of sampling units in the highway proper. The width of the sampling unit shall be the width of the paving lane, and the length of the sampling unit shall be determined by dividing the total length of paving lane in linear feet in the highway proper by the number of sampling units determined in the manner set forth. When paving lane width exceeds 24 ft. (7.2 meters), the Division may establish shorter sampling units.

When the number as determined above is less than 10, the total length of the paving lane in linear feet shall be divided into 10 equal sampling units.

501.19.1.2-Auxiliary Features: Intersections, entrances, exits, crossovers, ramps, etc., may be considered individually or collectively so as to form sampling units most nearly the length previously established in the highway proper.

501.19.2-Deficient Thickness (Detection and Delineation): One core will be taken from each sampling unit and the length of the core will represent the thickness of the unit.

When a sampling unit is represented by a core measurement which is less than the specified thickness minus 7.8%T. $T - 7.8\%T$, the sampling unit will be evaluated as set forth in [501.19.2.1](#).

501.19.2.1 - The part of the sampling unit considered to be deficient in thickness by $T - 7.8\%T$ or more will be delineated by taking additional cores at approximately 20 ft. (6 meter) intervals, parallel to the centerline, in each direction from the core obtained in [501.19.2](#), until a core is obtained, in each direction, which is not deficient in length by more than $T - 7.8\%T$. Areas thus defined shall be removed and replaced at no additional cost to the Division. These exploratory cores will not be used in the analysis of the remainder of the

501.19.3

unit. The balance of the sampling unit will be treated as a separate sampling unit.

One additional core will be obtained from the balance of the sampling unit to represent the unit. The thickness represented by this core, when greater than T-7.8%T, will be included in the measurements specified in [501.23.1.1](#).

501.19.3-Refilling of Cores: As soon as directions are issued by the Engineer, the Contractor shall refill and properly cure all test holes at no additional cost to the Division.

501.20-PAVEMENT WIDENING:

When called for on the Plans or directed by the Engineer to widen an existing pavement by means of strips of portland cement concrete, on one or both sides, the construction methods and materials shall be as specified for regular portland cement concrete pavement, except as modified.

- i. Compaction of the fine grade may be by means of an approved special roller capable of exerting a compressive force of not less than 100 lb. per in. (1.8 kg per mm) of width and as further prescribed in [207.9](#).
- ii. Forms may be of steel or wood. They shall be secured as required by the Engineer.

501.21-ADVERSE WEATHER CONDITIONS:

501.21.1-Cold Weather Concreting: When the component materials are not artificially heated and the temperature of the plastic concrete becomes less than 55° F (13° C), the provisions for cold weather concreting shall apply. The concrete shall have a temperature of at least 50° F (10° C) but not more than 85° F (30° C). This temperature shall be maintained by heating the water or aggregate, or both, as necessary. Heating methods which alter or prevent the entrainment of the required amount of air in the concrete shall not be used. The equipment shall be capable of heating materials uniformly. Aggregates or water shall not be heated to a temperature exceeding 150° F (65° C). Stockpiled aggregate may be heated by the use of dry heat or steam. Aggregates shall not be heated directly by gas or oil flame or on sheet metal over fire. Binned aggregates may be heated by steam-coil or water-coil heating. The use of live steam on or through binned aggregates will not be permitted.

If the Contractor is placing concrete or plans to place concrete during cold weather conditions, the Contractor shall advise the Division of their plans for curing and protecting the concrete. The Division may, at any time, require the Contractor to provide additional protection to cause the provisions of this Specification to be met. When concrete is being placed and the air temperature is expected to fall below 35° F (2° C), a sufficient supply of suitable blanketing material shall be provided. Any time the air temperature is expected to reach the freezing point during the day of placement or the following night, the

material so provided shall be spread over the pavement to a sufficient thickness to prevent freezing of the concrete. The material shall be covered or otherwise secured to insure that it will remain in place for the duration of the curing period.

No concrete shall be placed on a frozen subgrade. Materials containing frost or lumps of frozen material shall not be used.

501.21.2-Hot Weather Concreting: The Contractor will be required to state, at the pre-construction conference, their plan of action when the temperature of plastic concrete reaches 90° F (32° C).

When a shaded thermometer in the vicinity of the production plant reaches 85° F (30° C), thermometer readings of the temperature of the plastic concrete shall be taken at least once per hour.

When the temperature of the plastic concrete reaches 85° F (30° C), the elapsed time between the introduction of the mixing water to the cement-aggregates and discharge of the mix shall not exceed 45 minutes. At this temperature or above, particular attention shall be paid to the Specification provisions concerning the sprinkling and wetting of subgrade and forms, the maintenance of coarse aggregate stock in saturated surface-dry condition, and the prompt start of concrete curing operations.

When the temperature of the plastic concrete reaches 90° F (32° C), immediate steps shall be taken to cool either mixing water or aggregates, or both, in order to maintain a plastic concrete temperature of 90° F (32° C), or less. Crushed or flaked ice may be used to cool the mixing water. Crushed or flaked ice may also be introduced into the mixing drum when the concrete is batched and mixed in a truck mixer. The ice will be considered as part of the mix water in the mix proportions. The mixing operation shall not be considered complete until all ice in the drum has melted.

In no event shall concrete be placed when its temperature in the plastic state, at the completion of mixing, exceeds 90° F (32° C).

501.22-METHOD OF MEASUREMENT:

The quantity of concrete pavement to be paid for will be the number of square yards (meters) complete in place and accepted. The width for measurement will be the width of the pavement shown on the typical cross section of the Plans and additional widening where called for or as otherwise directed in writing by the Engineer. The length will be measured on the surface along the centerline of each roadway ramp.

Bridge approach expansion joints will be measured separately and shall be the actual number of joints constructed, complete in place and accepted.

In contracts where only widening is called for, the square yards (meters) of pavement widening will be determined from the length of strips, measured along the edges and upon the surface, times the width as measured at regular intervals, plus the area of any widening on curves, turnouts or intersections authorized and measured separately.

No extra payment will be made for removing and crushing the existing

501.23

pavement for use as coarse aggregate for concrete.

501.23-BASIS OF PAYMENT:

501.23.1-General: The quantities, determined as provided above, will be paid for at the contract unit prices less adjustments referred to below, which shall constitute full compensation for furnishing and preparing of all materials, including reinforcing steel, transverse and longitudinal joints, expansion joint filler, elastomeric joint seals, silicone sealant, epoxy mortar for joint repair work, polyethylene tape, rope or rod joint back-up material, lubricant-adhesive for elastomeric seals, and dowels or load transfer devices as are required in the Plans; placing, finishing and curing; and all labor, equipment, tools, field laboratory, supplies and incidentals necessary to complete the work.

501.23.1.1-The core measurements which represent the thickness of the sampling units shall be analyzed to determine the average value of the pavement thickness. This value will be used to determine the degree of compliance with the provisions set forth in 501.19 and to develop certain factors to be used in the derivation of equitable deductions as set forth in 501.23.1.2 and 501.23.1.3, in the event the provisions of this Specification are not met.

No payment will be made for pavement areas deficient in thickness by more than 7.8%T, the area being defined in the manner set forth in 501.19.2. Pavement which is deficient in thickness by more than 0.7 inches (18 mm) and is considered by the Engineer to be inadequate to perform satisfactorily shall be removed and replaced at no added cost to the Division. The balance of the item, the portion of the item not treated in the manner set forth above, will be treated in the manner set forth in 501.23.1.2 or 501.23.1.3.

501.23.1.2-When the average value of the pavement thickness is equal to or greater than the specified thickness, the quantity of pavement represented by this average thickness will be paid at the contract unit price.

501.23.1.3-When the average value of the pavement thickness is less than the specified thickness, the fraction of pavement having a thickness greater than the specified thickness minus 7.8%T will be paid for at a unit price as set forth in the following schedule, and no payment will be made for the remainder of the pavement being considered.

SCHEDULE OF UNIT PRICES	
AVERAGE VALUE OF PAVEMENT THICKNESS	UNIT PRICE AS PERCENT OF CONTRACT UNIT PRICE
0.01 to 0.10 Less Than Specified Thickness	98.0
0.11 to 0.20 Less Than Specified Thickness	96.0
0.21 to 0.30 Less Than Specified Thickness	94.0
0.31 to 0.40 Less Than Specified Thickness	92.2
0.41 to 0.50 Less Than Specified Thickness	90.3
0.51 to 0.60 Less Than Specified Thickness	88.4
0.61 to 0.70 Less Than Specified Thickness	86.5
More Than 0.70 Less Than Specified Thickness	0

SECTION 502 APPROACH SLABS

502.1-DESCRIPTION:

This work shall consist of reinforced portland cement concrete approach slabs for bridges, constructed on the completed and accepted subgrade, subbase or other base course, in accordance with these Specifications and in reasonably close conformity with the lines, grades and dimensions specified on the Plans or established by the Engineer.

502.2-MATERIALS:

Materials for this work shall conform to the requirements for materials in 501 except as modified.

Class B concrete, under the provisions of 601, may be used in lieu of the concrete in 501, in which case materials and batching requirements for this work shall conform to the requirements for 601.

Compressive strength tests for acceptance of concrete shall be conducted in accordance with 601.4.4.

Reinforcing steel shall conform to the requirements prescribed in 602.

CONSTRUCTION METHODS

Construction methods and equipment used for this work shall conform to the requirements prescribed for construction methods and equipment in 501, except as modified.

502.3-FORMS:

Side forms may be of steel or wood. Forms shall not be removed for at least 24 hours after the concrete is placed.

502.4-PLACING:

The subgrade or base shall be thoroughly moistened immediately prior to placing the concrete. The concrete shall not be placed until the forms and reinforcing steel have been checked. The method and sequence of placing concrete shall be approved by the Engineer.

Vibrators shall be so manipulated as to work the concrete thoroughly around the reinforcement and imbedded fixtures and into corners and angles of the forms.

502.5-JOINTS:

Approach slabs shall have longitudinal joints in line with the longitudinal joints of the adjacent pavement. Longitudinal joints shall be sawed to a minimum depth of one-fourth of the plan depth of the slab plus $\frac{1}{4}$ in. (6 mm); the width shall be $\frac{1}{4}$ in. (6 mm), with a tolerance of plus or minus 1/16

in. (2 mm) Sawing shall be performed within five days after the slab is placed and prior to opening to construction traffic. Joints shall be sealed in accordance with the requirements of 501.17 and 503.

502.6-CURBS:

The safety curbs shall be constructed using the same type of concrete as for the approach slab and shall be in accordance with the Plans. The finish of the curb shall be in accordance with 610.

502.7-METHOD OF MEASUREMENT:

The quantity of work done will be measured in square yards (meters) of "Portland Cement Concrete Approach Slab" complete in place and accepted; the area will be measured to the extremity of the concrete.

502.8-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item below, which price and payment shall be full compensation for furnishing all materials including reinforcing steel, such transverse and longitudinal joints, joint filler, dowels and curbs, and all labor equipment, tools and incidentals necessary to complete the work.

SECTION 503 SEALING JOINTS AND CRACKS IN CONCRETE PAVEMENT

503.1-DESCRIPTION:

This work shall consist of the cleaning and sealing of joints or cracks, or both, in concrete pavement in the manner and subject to the conditions and regulations prescribed.

503.2-MATERIALS:

For hot-poured joint sealing, the sealing material shall conform to the requirements of 708.3; sealing operations shall be as specified.

For sealing with preformed elastomeric seals, the sealing material shall conform to 708.2; requirements for installation of the seal shall be in accordance with 501.16.

CONSTRUCTION METHODS

503.3-NEW CONSTRUCTION:

On new concrete pavement construction, before opening to traffic all joints and cracks shall be cleaned to the full depth of the sawed cut or formed joint and sealed as prescribed.

503.4-MAINTENANCE:

In sealing joints and cracks in old concrete pavement, old filler and foreign material in the joints and cracks shall be removed. The joints and cracks shall then be sealed as prescribed.

503.5-PREPARATION OF MATERIAL FOR USE:

Before charging the compound into the melting unit, the unit shall be free from all foreign material. If the type of heater to be used requires that the sealing material, as shipped, be cut into smaller pieces before melting, the method used is subject to approval by the Engineer.

The heating kettle used for melting sealing materials shall be of the indirect heating or double boiler type, using oil as the heat transfer medium. It shall have a thermostatically controlled heat source, a built-in automatic agitator, and thermometers installed to indicate both the temperature of the melted sealing material and that of the oil bath. Other methods of indirect heating approved by the Engineer may be used. A positive means of controlling the temperature of the heat transfer medium at all points in the system shall be incorporated in the heater. Sealing material shall be uniformly heated until the pouring temperature recommended by the manufacturer is reached. Should the maximum pouring temperature recommended be exceeded, the material will be rejected. The material shall be poured as soon as possible after the pouring temperature is reached. Only sufficient material for the day's operation shall be heated each day.

503.6-PREPARATION OF JOINTS AND CRACKS FOR SEALING:

The joints shall be thoroughly cleaned of all loose scale, dirt, dust, other foreign matter, and loosely stuck particles of mortar and aggregate, so that sound and clean joint walls result. In new concrete pavement, joints shall be cleaned the full depth of the cut or formed opening; in old concrete pavement, the minimum depth of cleaning shall be 1 in. (25 mm), but the cleaning shall extend to a greater depth where necessary to remove loose or foreign material.

This may be accomplished by use of hand tools, power tools such as rotary brushes, or by any method or combination of methods. Cracks shall be cleaned of all loose material and old sealing compound. The use of any tool which results in damage to the pavement is prohibited. Just prior to the actual sealing operation, the joint or crack shall be thoroughly blown out with an air jet having sufficient volume and pressure to remove any loose material left by the cleaning operation. Priming shall be required when resealing joints which previously contained sealing material dissimilar to the new sealing material. Priming shall be accomplished by swabbing the joint walls with naphtha, varnelene, varsol,

or other highly volatile type of solvent prior to the sealing operations. Moderate heating at relatively low temperature will be permitted to facilitate preparation of the primer.

Just prior to the actual hot-poured sealing operation for transverse contraction and construction joints, joint back-up material shall be inserted into the joint as shown on the Plans. Joint back-up material shall be either stiff, self-adhering tape or acceptable rope or rod material. Joint back-up material shall be non-metallic, inert, resilient, compressible, non-absorbent, non-shrinking material compatible with the primer and sealant. Material impregnated with oil or bitumen shall not be used. The back-up material shall provide a bond breaker to insure the sealant adheres only to the joint faces and not the bottom of the reservoir. The back-up material shall also support the sealant so that it does not otherwise sag or slide into the joint below the back-up material.

503.7-EQUIPMENT FOR APPLYING SEALER:

The equipment used for the placing of sealing material in the joints may consist of conventional hand pouring pots, individual mechanical pouring kettles mounted on wheels with a pouring shoe, or heating units from which material may be discharged into the joint through the use of flexible lines and suitable shoes. Any heat which it may be necessary to apply to sealing material after it leaves the main heating unit shall be applied by indirect and controlled methods as specified in 503.5. No direct heat will be permitted on the pouring unit in order to meet field controls set forth below. Any method of placing sealing material which results in compliance with the following requirements will be satisfactory.

503.8-PLACEMENT REQUIREMENTS:

All joints shall be filled to within $\frac{1}{4}$ in. (6 mm), with a tolerance of plus or minus $\frac{1}{16}$ in. (2 mm), of the surface of the pavement and to the depth required; in no case shall the joints be overflowed.

In resealing joints in old concrete, sealing material shall be poured to the full depth of the cleaned joint. Any spillage of sealing material on pavement areas shall be immediately removed. If pouring shoes are used which overlap the pavement surface adjacent to the joint, the resulting strip shall be straight and neat with no excess material left on the surface of the pavement. A neat and workmanlike job will be required at all times. At no time shall sealing material be placed in a joint which is either dirty or wet. The joint shall be clean and surface dry at the time of placement. Work will be suspended when joints are wet or damp and when atmospheric temperature is below the minimum specified by the manufacturer.

503.9-METHOD OF MEASUREMENT:

The quantity of work done will be measured in linear feet of "Sealing Joints and Cracks", when the item below is included in the Contract.

503.10

503.10-BASIS OF PAYMENT:

The quantity of work, as determined above, will be paid for at the contract unit price bid for the item below, which price and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all the labor, tools, equipment, supplies and incidental necessary to complete the work.

SECTION 504
BITUMINOUS UNDERSEAL FOR
CONCRETE PAVEMENT

504.1-DESCRIPTION:

This work shall consist of drilling holes in portland cement concrete pavement at the locations shown on the Plans or where directed by the Engineer, pumping bituminous material through the holes, and sealing the holes with cement grout.

504.2-MATERIALS:

The materials shall meet the requirements specified in the following Subsections of Division 700:

MATERIAL	SUBSECTION
Asphalt Cement	705.6
Portland Cement	701.1 & 701.3
*Fine Aggregate	702.1
Water	715.7

* The use of limestone sand will not be permitted.

Grout for sealing holes shall consist of one part portland cement and three parts fine aggregate, mixed to the consistency directed by the Engineer.

CONSTRUCTION METHODS

504.3-GENERAL:

Holes of 1 ½ in. (40 mm) diameter shall be drilled through the concrete pavement at the locations shown on the Plans or as directed by the Engineer.

Bituminous material shall then be pumped through the holes and under the pavement by means of an approved type of pump.

Equipment for pumping shall be capable of developing a pressure of 80 lb. per sq. in. (550 kPa), the exact working pressure to be determined by the Engineer.

Prior to pumping, the surface of the concrete pavement around the previously drilled holes shall be thoroughly sprinkled with water or shall be covered with sand, earth or other suitable material in order to prevent any bitumen that may be spilled on the pavement from adhering to the surface. The nozzle shall then be inserted in the hole, driven to a snug fit, and pumping operations begun. Bituminous material shall be pumped through the holes and under the pavement until the voids under the pavement are completely filled, or the concrete pavement has been raised to the grade of existing adjacent pavement or to such grade as directed by the Engineer. At the first indication of an undesirable movement of the slab or a blowout, pumping shall immediately be discontinued. The connecting device placed in the drilled hole shall not be removed from the hole until the bitumen has cooled sufficiently to prevent backflow. At the time the bituminous material is pumped under the pavement, it shall have a temperature of not less than 400° F (205° C). The Contractor shall provide all necessary facilities for determining the temperature of the bituminous material in all heating equipment and distributors.

After completion of the pumping in each hole, all bituminous material shall be cleaned from the pavement surface and the drilled hole shall be filled with grout to an elevation flush with the pavement surface.

After the completion of subsealing operations, the pavement surface shall be left in a clean and neat condition satisfactory to the Engineer.

The bituminous material shall not be applied on a frozen subgrade, nor when the atmospheric temperature is below 40° F (5° C) and is falling, with the further provision that it shall be placed only when general weather conditions, in the opinion of the Engineer, are suitable.

504.4-METHOD OF MEASUREMENT:

The quantity of work done will be measured in gallons (liters) of "Bituminous Underseal Material" and in "Drilling Holes in Concrete Pavement" determined as follows: The quantity of "Bituminous Underseal Material" shall be the number of gallons (liters) incorporated in the completed and accepted work, which volume will be measured as prescribed in 109.1. The quantity of "Drilling Holes in Concrete Pavement" shall be the actual counted number of holes drilled and satisfactorily filled.

504.5-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials, including grout, and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies and incidentals necessary to

504.6

complete the work.

CONCRETE PAVEMENT REPAIR AND HIGH EARLY STRENGTH CONCRETE PAVEMENT REPAIR

506.1-DESCRIPTION:

This work shall consist of the removal and replacement of deteriorated concrete pavement and patches at locations as shown on plans or as specified by the Engineer. This work shall conform to the requirements of Section 601 except as modified herein.

506.2-MATERIALS:

Materials shall meet the provisions of 601.2.

Epoxy-coated dowel bars shall meet the requirements of Section 709.15.

Water reducer-accelerating admixtures shall meet the requirements of AASHTO M 194 Type E.

506.3-PROPORTIONING:

506.3.1-Concrete Pavement Repair: When Item 506001-* is specified, the concrete produced shall meet the requirements of Class B Concrete as specified in Section 601.

506.3.2-High Early Strength Concrete Pavement Repair: When Item 506002-* is specified, the concrete shall have a design compressive strength of 2000 psi at age 6 hours and shall have an entrained air content of $7\% \pm 2.5\%$.

506.4-OPENING PAVEMENT TO TRAFFIC:

When the strength of concrete specimens representing the concrete placed indicate that the concrete has attained a strength of 2000 psi, that concrete represented by the specimens may be put into service.

506.5-EQUIPMENT AND TOOLS:

All provisions of 501.5, Equipment and Tools, shall apply.

506.6-EXISTING PAVEMENT REMOVAL:

Removal of the existing pavement may be done by a method of the Contractor's choosing provided he removes the existing pavement full depth, and does not damage the adjacent concrete.

506.7-PLACING CONCRETE:

The concrete shall be placed in the patch using a metal chute; the free fall shall not be more than 3 ft. If the concrete does not fall into its final position in the patch, it shall be moved by means of shovels. Raking is prohibited. The concrete shall be worked with tampers, spades, or others tools to completely fill the patch area. Maximum effort will be used to insure that the area beneath the existing concrete pavement is completely filled; internal vibration will be used.

Following the placing of the concrete, the surface will be struck off to finished grade by means of an adjustable steel or wooden template and floated to a smooth finish.

506.8-METHOD OF MEASUREMENT:

The quantity of concrete pavement repair to be paid for will be the number of square yards complete in place and accepted.

506.9-BASIS OF PAYMENT:

The quantity of concrete pavement repair, determined as provided above, will be paid for at the contract unit price, which shall constitute full compensation for the furnishing, hauling, and placing of all materials, including admixtures, removal and disposal of old concrete, and all labor, tools, equipment, and incidentals necessary to complete the item.

506.10 - PAY ITEM:

SECTION 507

CRACK AND POTHOLE REPAIR

507.1 - DESCRIPTION:

This work shall consist of repairing an existing concrete pavement surface prior to resurfacing with hot-laid asphalt concrete in accordance with these specifications.

507.2 - MATERIALS:

The materials shall conform to the requirements of the following sections.

MATERIAL	SECTION
Performance Graded Binder	705.5
Fine Aggregate	702.3
Tack Coat	408
Hot-Mix Asphalt Base Course	401

507.3 - CONSTRUCTION METHODS:

All cracks in excess of 1 in. (25 mm), but less than 3 inches (75 mm) in width, shall be thoroughly cleaned of all dirt, debris, loose or other foreign or unstable material and filled with a mixture of sand and asphalt. The asphalt content shall be 5 to 10%. Asphalt mixture shall be applied at a temperature range of 250° to 325° F (120° C to 162° C).

All cracks in excess of 3 inches (75 mm) and all potholes greater than 1 in. (25 mm) in depth, shall be thoroughly cleaned of all dirt, debris, loose or other foreign or unstable material. After cleaning, the cracks and potholes are to be tacked, in accordance with Section 408 of the Specifications, and filled with asphalt concrete base course material in accordance with 401 or as approved by the Engineer.

Prior to resurfacing, all cracks and potholes are to have the same finished grade as the adjacent surfaces.

507.4 - METHOD OF MEASUREMENT:

The quantity of work done for crack and pothole repair will be measured by the actual number of tons (megagrams) of material used for crack and pothole repair and shall include cleaning, tack material, asphalt, sand, asphalt concrete base course complete in place and accepted.

507.5 - BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the item listed below, which price and payment shall be full compensation for furnishing all the materials, and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

507.6 - PAY ITEM:

DIVISION 600 INCIDENTAL CONSTRUCTION

SECTION 601 STRUCTURAL CONCRETE

601.1-DESCRIPTION:

This work shall consist of furnishing and placing portland cement concrete for structures, and incidental construction, in accordance with these specifications and in reasonably close conformity with the lines, grades and dimensions as shown on the Plans or established by the Engineer.

All concrete shall be air-entrained.

Classes of concrete shall be used as indicated below unless noted otherwise on the Plans:

Class A concrete shall be used in railing, cribbing, precast shapes, for filler, and in steel grid floors.

Class K concrete shall be used in all sidewalks, parapets, decks, and median barriers when they are a part of the bridge superstructure.

Class B concrete shall be used in all beams and girders, roadway sidewalks, columns, hammerhead piers, arch rings including ties and spandrel walls, rigid frames, box culverts, heavily reinforced abutments, retaining walls, footings, pedestals and other areas not specifically designated as to class of concrete.

Class C concrete shall be used in massive footings and pedestals, massive pier shafts, gravity walls and, in general, for non-reinforced or lightly reinforced concrete.

Class D concrete shall be used as unformed and non-reinforced concrete for backfilling of any excavated pockets or voids on which footings are to be located.

If the Contractor so elects, the Engineer may permit the use of a higher class concrete than the particular class designated for the work, in which event the higher class concrete shall meet the Specifications applicable without additional compensation.

When called for on the Plans, an admixture of water-reducing retarder shall be added to all concrete so specified. A retarder may be used in other concrete at the Contractor's option.

A water-reducing admixture may be used at the Contractor's option. A water-reducing admixture may not be used in conjunction with a water-reducing retarder.

The work will be accepted in accordance with these Specifications and the applicable requirements of 105, 106, and 109.

601.2-MATERIALS:

Materials shall meet the requirements specified in the following Sections or Subsections of Division 700:

MATERIAL	SECTION OR SUBSECTION
*Portland Cement	701.1, 701.3
Air-Entraining Admixtures	707.1
Water-Reducing, Set-Retarding Admixtures	707.2
**Fine Aggregate	702.1
Coarse Aggregate	703
Boiled Linseed Oil	711.2
Petroleum Spirits (Mineral Spirits)	711.5
Water	715.7
Curing Materials	707.6-707.10
Water Reducer	707.3
Epoxy Resin Protective Coating	707.11
Pozzolanic Additives	707.4

*It is normally intended that the product of only one mill or of any one brand or type of portland cement be used on any one structure.

**Only siliceous sand shall be used as fine aggregate in bridge deck wearing surfaces.

***The use of a pozzolanic additives will not be permitted when a blended hydraulic cement is used. Unless otherwise permitted by the Engineer, only one source of a pozzolanic additive shall be used in any one structure.

Shipping and Storage of Cement: Cement shall be shipped from pretested and approved bins at the mill or distribution terminals. Cement stored by the Contractor for a period longer than 90 days shall be retested before being used in the work. Cement failing to meet any of the specified requirements at any time prior to incorporation into the work will be rejected and shall be removed from the work. Cements of different brands, types, or from different mills shall be stored separately.

Shipping and Storage of Pozzolanic Additives: Pozzolanic additives shall be shipped from only those sources approved by the Division. Bulk pozzolanic additives shall be stored at the job site in weatherproof bins. Pozzolanic additives from different sources or from different lots at the same source shall be stored separately.

CONSTRUCTION METHODS

601.3 - PROPORTIONING:

601.3.1 - Mix Design Requirements:

Prior to the start of construction, the Contractor shall design and submit to the Engineer for approval the proportion of materials, including admixtures, to be used which will result in a workable concrete having the applicable properties enumerated below, including those of Table 601.3.1A. A mix design prepared in accordance with MP 711.03.23, shall be required for each class of concrete to be used in the work. The mix design shall be accompanied by a statement giving the source of materials and certified test data from a Division approved laboratory demonstrating the adequacy of the mix design. The Contractor shall notify the Engineer of any change in the source of materials or the addition of admixtures during the progress of the work, since such change may necessitate a new mix design. The Contractor shall also state the \bar{A} value of the fine aggregate and the \bar{A} value of the combined grading of the coarse aggregate, fine aggregate, and cement used in the mix design.

TABLE 601.3.1A
{ENGLISH}

Class of concrete	Design 28 Day Compressive Strength	Target Cement Factor	Maximum Water Content	Standard Size of Coarse Aggregate	Entrained Air
	Pounds per Square inch	Bags/c.y. *	Gal/bag Of cement **	Number	Percent
A	3500	7¼	5¾	7, 78, or 8	7½
K	4000	7	5	57, 67	7
B	3000	6	5½	57, 67	7
C	2500	5¼	6½	57, 67	6
D	2000	4¼	7	57, 67	5½

{METRIC}

Class of concrete	Design 28 Day Compressive Strength	Target Cement Factor	Maximum Water Content	Standard Size of Coarse Aggregate	Entrained Air
	Mpa	Kg per cu. M. *	L/Kg Of cement **	Number	Percent
A	24	404	0.51	7, 78, or 8	7½
K	28	390	0.44	57, 67	7
B	21	335	0.48	57, 67	7
C	17	295	0.58	57, 67	6
D	14	235	0.62	57, 67	5½

*An equal volume of a pozzolanic additive may be substituted for Portland cement up to the maximum amount in Table 601.3.1B. Only one pozzolanic additive is permitted in a mix design.

TABLE 601.3.1B

MATERIAL	CLASS OF CONCRETE	QUANTITY
Fly Ash	B, C, D	1 Bag (15%)
	A, K	1 ¼ Bags (19%)
Ground Granulated Furnace Slag	A, B, K	3 Bags (45%)
	C, D	2 Bags (30%)
Microsilica	All Classes	1/2 Bag (8%)

** When using a pozzolanic additive, volumes of these materials shall be considered as cement for purposes of establishing maximum water content.

MP 711.03.26 shall be used to control the cement factor in all classes of concrete.

601.3.2 - Field Tolerances and Adjustments:

601.3.2.1 - Consistency:

Concrete shall have the consistency which will allow proper placement and consolidation in the required position. Every attempt shall be made to obtain a uniform consistency. The optimum consistency for various types of highway structures shall be as indicated in Table 601.3.2.

TABLE 601.3.2 CONSISTENCY

TYPE	*OPTIMUM CONSISTENCY Inches of Slump (mm of slump)
i. For structures which have exposed, inclined surfaces such as concrete gutters, cast in place concrete slope protection, etc., requiring low slump concrete to allow proper placement and consolidation and the maintenance of the prescribed geometry; those structures which are placed by slip form construction methods where a low slump is required to maintain the <u>prescribed geometry; and mass nonreinforced concrete.</u>	1 inch (25 mm)
ii. For reinforced concrete structures which are sufficiently massive and generally have sufficient clearances to allow the access of workers into the immediate area of concrete placement, such as bridge piers, column and abutment footings; piers, large columns, and other similar type structures into which workers may enter for the purpose of placing and consolidating the concrete.	2 inches (50 mm)
iii. a. For reinforced concrete structures which are not easily accessible for spading and vibrating and offer a fair degree of difficulty in the placement and consolidation of the concrete, such as pier caps and abutments, beams and girders, box culverts, miscellaneous structure footings and other slab type structures, wall or vertical sections 8 inches (200 mm) or greater in width with one line of reinforcement or 12 inches (300 mm) or greater in width with two lines of reinforcement.	3 inches (75 mm)
b. For bridge decks with a mix design having a water content between 3.96 and 5.0 gallon (15 and 19 liters) per bag of cement.	2 ½ inches (62 mm)
c. For bridge decks with a mix design having a maximum water content of 3.95 gallon (15 liters) per bag of cement.	5 inches (125 mm)

TYPE	*OPTIMUM CONSISTENCY Inches of Slump (mm of slump)
iv. For structures which are inaccessible to workers and generally offer a considerable degree of difficulty in the placement and consolidation of the concrete, such as long slender columns and thin-walled 3 ½ sections less than 8 inches (200 mm) thickness.	3 ½ inches (87 mm)
v. For structures which present peculiar conditions under which concreting must be done, such as structural steel encasement; other special structures which contain small openings through which the concrete must pass; tremie concrete which must be placed and consolidated into all spaces without mechanical disturbances; and other special structures which would require high consistency concrete for proper placement and consolidation.	**

* If the consistency exceeds the target value plus one inch (25 mm), the Contractor shall take immediate steps to reduce the slump of succeeding loads by making necessary adjustments in the mixture. The Contractor will be allowed a reasonable time for the trucks already on the road for a central mix or truck mix operation. Failure to comply will be cause for rejection of the concrete. If the consistency exceeds the target value plus 1 ¾ inches (445 mm), the concrete will be rejected.

** The optimum consistency shall be that consistency which will allow a proper placement and consolidation of the concrete into all spaces.

601.3.2.2 - Air Content:

The target value of the entrained air at the point of placement shall be as shown in Table 601.3.1A. If the entrained air does not conform with the target value within plus or minus 2.5 percentage points, the Contractor shall take immediate steps to adjust the air content of succeeding loads by making necessary adjustments in the mixture. The air content shall be measured on loads already batched and enroute, as well as the first load to which any adjustments were made in batching procedures. If the air content exceeds the target value plus 3.0 percentage points the concrete shall be rejected. When the concrete is delivered in a truck mixer and the air content is less than the target value minus 2.5 percentage points the concrete shall be rejected, or the Contractor may use additional air entraining agent in an amount that is intended to achieve the target value specified. The addition is permitted under the following conditions:

- i. The air entraining agent is the same as used in the approved mix design and is thoroughly mixed with a minimum of 2 gallons (7.57 liter) of water. The solution will be directed to the front of the mixer.
- ii. The mixer is turned a minimum of 30 revolutions, at mixing speed, or the number of revolutions established in tests to comply with uniformity requirements, whichever is more.

601.3.2.3

- iii. Immediately after mixing, the air content and slump shall be measured by a certified inspector or technician.

An air adjustment may be attempted twice per truck. If after the second addition the specified air content is not achieved, the concrete shall be rejected. These procedures do not alter the limits placed on time to discharge, the total revolutions of the mixing drum, or the specified slump.

601.3.2.3 - Yield:

The approved mix design shall be subject to modification under the conditions prescribed.

After the start of the first concreting operation and immediately after the specified consistency and entrained air have been established, three unit weight determinations shall be made from different batches and the average of the three determinations shall be considered the unit weight of the concrete. The actual yield shall be determined from the average unit weight. The design mix shall be adjusted as required to correct the actual yield to correspond to the theoretical.

During the progress of the work, the actual yield may be verified; and, if the yield based on a single unit weight determination should differ from the theoretical more than plus or minus two percent, two additional unit weight determinations shall be made and the average of the three determinations shall be considered the unit weight of the concrete. The actual yield shall be determined from the average unit weight, and the design mix shall again be adjusted as required to correct the actual yield to correspond to the theoretical.

In addition to the mix design adjustments specified above to correct for yield, other adjustments in the design mix proportions shall be made as necessary to maintain a plastic, workable mix with suitable finishing characteristics.

No change in the brands or sources of material shall be made without prior approval of the Engineer. Methods for determining the properties enumerated above shall be in accordance with 601.4.

601.3.2.4 - Total Solids \bar{A}

The combined grading of the coarse aggregate, fine aggregate, and cement used in the structural concrete shall conform to the design mix \bar{A} plus or minus the tolerance specified in the following table for the coarse aggregate size used.

TABLE 601.3.2.4 - Total Solids \bar{A}

COARSE AGGREGATE SIZE NUMBER	DESIGN MIX \bar{A} TOLERANCE
3 OR 4	± 0.35
57 OR 67	± 0.25
7, 78 OR 8	± 0.15

\bar{A} is the value of total solids (coarse aggregate, fine aggregate and cement). The grading of the total solids shall be determined by the Contractor at least once each production day. Should the moving average of any five consecutive grading test results of the total solids have an \bar{A} outside the specified mix design tolerance limits, production shall be discontinued until appropriate corrections are made. Corrections shall be made either in the proportions of the concrete (the mix design), the gradation of the aggregates, or the storage and loading of the aggregate, as the Contractor may elect.

601.4-TESTING:

601.4.1-Sampling and Testing Methods:

Sampling fresh concrete	AASHTO T 141
Sampling aggregate	MP 700.00.06
Sieve analysis of fine and coarse aggregates	AASHTO T 27 and T 11
Slump of portland cement concrete	AASHTO T 119 (Note 1)
Air content of freshly mixed concrete	AASHTO T 152 AASHTO T 196 With MP 711.03.20
Unit weight/Yield of concrete	AASHTO T 121
Making and curing concrete compressive specimens	AASHTO T 23 With MP 601.04.20
Compressive strength of cylindrical concrete specimens	AASHTO T 22
Total moisture content of aggregate by drying	AASHTO T 255
Predicting potential strength of portland cement concrete	MP 711.03.31
Determination of \bar{A} of total solids in concrete	MP 601.03.51
Determination of free moisture in fine aggregate using 20 gram or 26 gram A "Speedy Moisture Tester"	MP 702.00.20

601.4.2

Note 1 - When testing concrete produced by volumetric batching and continuous mixing, the consistency testing shall be delayed for approximately three to five minutes after mixing.

601.4.2-Contractor's Quality Control: Quality control of the structural concrete is the responsibility of the Contractor as designated in MP 601.03.50. **The Contractor shall maintain equipment and qualified personnel, including at least one certified portland cement concrete technician who shall direct all field inspection, sampling and testing necessary to determine the magnitude of the various properties of concrete governed by the Specifications and shall maintain these properties within the limits of this Specification.** The quality control plan designated in MP 601.03.50 shall be submitted to the Engineer at the preconstruction conference. Work shall not begin until the plan is reviewed for conformance with the contract documents.

601.4.3-Acceptance Testing: Acceptance sampling and testing of portland cement concrete is the responsibility of the Division, except for furnishing of necessary materials.

Quality control sampling and testing performed by the Contractor may be utilized by the Division for acceptance.

Strength as used in this specification, is only one indicator of the durability of the portland cement concrete. Evaluation of structural concrete may include evaluation of the freeze-thaw durability, scaling characteristics, abrasion resistance, density and such other factors the Division deems appropriate.

601.4.4-Compressive Strength Tests for Acceptance: A strength test shall consist of three standard test specimens. The test shall be the average of the three specimens, except that if one specimen shows manifest evidence of improper sampling, molding, or testing, it shall be discarded and the remaining two strengths averaged. Should more than one specimen representing a given test show definite defects due to improper sampling, molding, or testing, the entire test shall be discarded.

Compressive strength tests shall conform to the requirements of Table 601.3.1. Statistical analysis may indicate a percentage of production to be below nominal minimum design strength. Concrete represented by compressive strengths below the nominal minimum design strength of Table 601.3.1 may be removed and replaced by the Contractor. If the Contractor elects to leave the material in place, it will be evaluated as to adequacy for the use intended. All concrete evaluated as unsatisfactory for the use intended shall be removed and replaced or otherwise corrected by and at the expense of the Contractor as required in 105.3. When an evaluation indicates that the work may satisfactorily remain in place, a statistical analysis will be made of the material. If this statistical analysis indicates at least 93 percent of the material may be expected to have compressive strengths equal to or greater than that shown in Table 601.3.1 and 99.87 percent of the material may be expected to have compressive strengths at least one standard deviation above the allowable

601.5.2.5

design stress ($f_c + \sigma$), the work will be accepted as substantially complying with the specification requirements. If this statistical analysis indicates that less than 93 percent of the material may be expected to have compressive strengths equal to or greater than that shown in Table 601.3.1 or less than 99.87 percent of the material may be expected to have compressive strengths at least one standard deviation above the allowable design stress ($f_c + \sigma$), the Engineer will provide for an appropriate adjustment under the provisions of 601.15.

The Division's statistical analysis will be based on a minimum of 10 cylinder test results. These results may be from the concrete item being placed, the same class of concrete on the project or the same class of concrete from the producer.

601.5-EQUIPMENT AND TOOLS:

601.5.1-Field Laboratory: Field laboratory provisions shall conform to the requirements prescribed in 501.5.1.

601.5.2-Batching Plant and Equipment:

601.5.2.1-General: The batching plant shall include bins, weigh hoppers, and scales for the fine aggregate and for each size of coarse aggregate. If cement is used in bulk, a separate bin, weight hopper, and scale for cement shall be included. The cement weight hopper shall be properly sealed to preclude dusting during operation and shall be properly vented to prevent a build-up in pressure. The discharge chute shall not be suspended from the weighing hopper and shall be so arranged that cement will not lodge in it nor leak from it. When fly ash is used in the concrete a separate bin shall be included.

601.5.2.2-Bins: Bins with adequate separate compartments for fine aggregate and for each size of coarse aggregate shall be provided in the batching plant.

601.5.2.3-Scales: The scales for weighing aggregates and cement shall conform to the requirements in 109.1.

Scales shall be inspected and sealed as often as may be deemed necessary to assure their continued accuracy. The Contractor shall have on hand not less than ten 50 lb. (20 kg) weights for testing scales.

601.5.2.4-Automatic Weighing Devices: Batching plants equipped to proportion aggregates and bulk cement by means of automatic weighing devices of an approved type may be used.

601.5.2.5-Water Measuring Equipment: Water shall be measured by volume or by weight. The device for the measurement of the water shall be readily adjustable and, under all operating conditions, shall have an accuracy

601.5.2.6

within one percent of the quantity of water required for the batch.

601.5.2.6-Admixture Dispenser: A positive, automatic method shall be used for adding each admixture in solution.

601.5.2.7-Aggregate Sampling: Provisions shall be made to allow a rapid sampling of the aggregates as they pass from the storage bin to the weigh hopper or as they pass from the storage bin into the conveyor feed.

601.5.3-Mixers and Agitators: Site and central mixers, truck mixers, truck agitators, and non-agitator trucks shall conform to the requirements of AASHTO M 157, except as modified.

Volumetric mixers shall conform to the requirements of AASHTO M 241, except as modified.

Central mixers shall be equipped with a device which will automatically lock the discharge lever when the drum has been charged and release it at the end of the mixing period. The device shall be equipped with a bell or other suitable warning device adjusted to give a clearly audible signal each time the lock is released. In case of failure of the timing device, the mixer may be used for the balance of the day while it is being repaired, providing that each batch is mixed for the specified time period.

All mixers shall be cleaned at suitable intervals. The pickup and throw-over blades in the drum or drums shall be repaired or replaced when they are worn down $\frac{3}{4}$ in. (20 mm) or more. The Contractor shall either have available at the job site a copy of the manufacturer's design, showing dimensions and arrangements of blades in reference to original height and depth, or provide permanent marks on blades to show points of $\frac{3}{4}$ in. (20 mm) wear from new conditions. Holes of $\frac{1}{4}$ in. (6 mm) diameter near each end and at midpoint of each blade are recommended).

601.6-HANDLING, MEASURING, AND BATCHING OF MATERIALS:

Handling, measuring, and batching of materials for ready-mix concrete shall conform to the requirements specified in [501.7](#). Handling, measuring, and batching of materials for volumetric batching and continuous mixing shall conform to the applicable requirements specified in [501.7](#) and AASHTO M 241.

601.7-MIXING:

Concrete may be central-mixed, truck-mixed, or shrink-mixed as defined in AASHTO M 157 and will be designated as ready-mixed concrete. The production of ready-mixed concrete shall meet the applicable requirements of AASHTO M 157, paragraphs ten and eleven, except as otherwise specified.

Concrete for incidental construction items may be made by volumetric batching and continuous mixing as designated in ASTM C 685, except as otherwise specified. Concrete produced by this method will not be permitted in bridge, box culvert, pavement, or retaining wall construction.

601.8.1

When a truck mixer or agitator is used for transporting concrete, the concrete shall be delivered to the site of the work and discharge shall be completed within one and one-half hours after the addition of the cement to the aggregates. Each batch of the concrete delivered at the job site shall be accompanied by a batch ticket (Form HL 411A) bearing complete batching information. In adverse weather or under other conditions contributing to quick stiffening of the concrete, or when the temperature of the concrete is 85° F (30° C) or above, the time between the introduction of the cement to the aggregates and discharge shall not exceed one hour. When a truck mixer is used for the complete mixing of the concrete, the mixing operation shall begin within one hour after the cement has been added to the aggregate.

The addition of water after completion of initial mixing will not be permitted, except that when concrete is delivered in truck mixers, additional water may be added to adjust to a specified consistency. In this event, a minimum of 20 additional revolutions of the truck mixer drum at mixing speed shall be required before discharge of any concrete; the maximum allowable time between the addition of the cement to the aggregates and the discharge of the batch shall not be exceeded. Concrete that is not within the specified consistency limits at the time of placement shall not be used.

Shrink-mixed concrete is a ready-mixed concrete which is initially and partially mixed in a central mix plant and lastly mixed to completion in a truck mixer while in transit to or after arrival at the job site. Shrink-mixed concrete will be allowed for use in the work if specified in the Contract.

601.8-FORMS:

601.8.1-General: Forms shall be of wood, metal or other approved material and shall be mortar tight and sufficiently rigid to prevent distortion due to pressure of the concrete and other loads incident to the construction operations including vibration. Wood forms shall be constructed and maintained so as to prevent the opening of joints due to shrinkage of the lumber. Stay-in-place forms will not be permitted unless provided for in the Contract.

All falsework shall be designed and constructed to provide the necessary rigidity and to support the loads without appreciable settlement or deformation. Suitable jacks, wedges or other approved devices shall be used to maintain the forms at correct elevation and to permit lowering the centers gradually and uniformly without injury to the structure.

A "Telltale" or other approved type of indicator shall be attached to the forms and arranged in such a manner that any settlement or movement in the forms or falsework is indicated. Forms shall be filleted and chamfered as shown on the Plans and shall be given a bevel or draft in the case of all projections to assure easy removal.

All field welding shall be performed by a certified welder. Welding of form ties and supports to the beam will not be permitted. Welding of screed rail supports will not be permitted in the top flange in tension zone.

601.8.2

601.8.2-Form Lumber: Form lumber for all exposed concrete surfaces shall be dressed at least on one side and two edges.

601.8.3-Metal Ties: Metal ties or anchorages within the forms shall be constructed to permit their removal to a depth of at least 1 in. (25 mm) from the face without injury to the concrete. Only rods shall be used for internal ties. The cavities shall be filled with cement mortar and the surface left sound, smooth, even, and uniform in color.

601.8.4-Cleanouts: Where the bottom of the form is inaccessible, the lower form area shall be left loose or other provisions made so that extraneous material may be removed from the forms immediately before placing the concrete.

601.8.5-Surface Treatment: Forms shall be treated with oil in such manner as to prevent contamination of reinforcing steel. Oil which will adhere to or discolor the concrete shall not be used.

601.8.6-Metal Forms: The metal used for the forms shall be of such thickness that the forms will remain true to shape. All bolts and rivet heads shall be countersunk. Clamps, pins, and other connecting devices shall be designed to hold the forms rigidly together and to allow removal without injury to the concrete. Metal forms which do not present a smooth surface or do not line up properly shall not be used. Metal forms shall be kept free of rust, grease, or other foreign matter.

601.8.7-Removal of Forms and Construction of Superimposed Elements: The forms for any portion of the structure shall not be removed until the concrete is strong enough to prevent damage. Methods of form removal likely to cause overstressing of the concrete shall not be used. The minimum requirements for removal of forms or supports and the construction of superimposed elements shall be as specified in [Table 601.8.7](#).

TABLE 601.8.7
REQUIREMENTS FOR REMOVAL OF FORMS AND
CONSTRUCTION OF SUPERIMPOSED ELEMENTS

STRUCTURAL ELEMENT	REMOVAL OF FORMS	PLACING CONCRETE IN SUPERIMPOSED ELEMENTS
	Compressive Strength – psi (Mpa)	Compressive Strength – psi (Mpa)
Bridge Decks	2000 (14.0)	3000 (21)
Columns	2000 (14.0)	2000 (14.0)
Walls & Beams	2000 (14.0)	2000 (14.0)
Footings	500 (3.5)	2000 (14.0)
Components Supported By Falsework	3000 (21)	3000 (21)
Parapets	2000 (14.0) (See 601.11)	----

601.8.8-Slip Forming: Slip forming and related methods of placing concrete may be used. At the Contractor's option, parapet wall joints and median barrier on the bridge may be sawed in lieu of formed open joints and the joints shall be spaced as shown on the Plans and shall be $\frac{1}{4}$ in. \pm 1/16 in. (6 mm \pm 1.6 mm) wide. Joints shall be sawed full width from the top of the wall to the upper break point in the wall. From the upper break point to the bottom of the wall a 2 inches (50 mm) minimum depth saw cut shall be made along the face and back of the wall. Joints shall be sealed in accordance with Section 501.16.1. The face of the back-up material shall be $\frac{1}{2}$ in. (13 mm) minimum from the concrete surface.

Initial sawing of joints shall commence as soon as the concrete has hardened sufficiently to permit sawing without excess raveling, usually 4 to 24 hours. All joints shall be initially sawed before uncontrolled shrinkage cracking takes place, but no later than 24 hours after placement of concrete.

601.9-ADVERSE WEATHER CONDITIONS:

601.9.1-Cold Weather Concreting: The plastic concrete shall have a temperature of at least 50° F (10° C) but not more than 85° F (30° C) at the time of placing. When the plastic concrete has a temperature of less than 55° F (13° C), the provisions for cold weather concreting shall apply. Maintenance of at

601.9.2

least the minimum temperature shall be accomplished by heating the water or the aggregates, or both, as necessary. Heating methods which alter or prevent the entrainment of the required amount of air in the concrete shall not be used.

Heating equipment shall be capable of heating the materials to achieve the specified temperature of the plastic concrete. The temperature of the aggregates or water shall not exceed 150° F (65° C) at the time the cement is added to the mixture. Materials containing frost or lumps of frozen materials shall not be used.

If the Contractor is placing concrete or plans to place concrete during cold weather conditions, the Contractor shall advise the Division of his plans for curing and protecting the concrete. The Division may at any time, require the Contractor to provide additional protection to cause the provisions of this specification to be met.

Stockpiled aggregate may be heated by the use of dry heat or steam. Aggregates shall not be heated directly by gas or oil flame or on sheet metal over fire.

Binned aggregates may be heated by steam-coil or water-coil heating. The use of live steam on or through binned aggregate will not be permitted.

The use of calcium chloride to hasten the initial set of structural concrete will not be permitted.

Insulated forms may be used for protecting and curing concrete. There will be no additional cost to the Division for the use of insulated forms.

601.9.2-Hot Weather Concreting: The Contractor will be required to state, at the pre-construction conference, his plan of action when the temperature of plastic concrete reaches 90° F (32° C).

When a free air, shaded thermometer in the vicinity of the concrete production plant reaches 85° F (30° C), thermometer readings of the temperature of the plastic concrete shall be taken at least hourly.

When the temperature of the plastic concrete reaches 85° F (30° C), the elapsed time between the introduction of the mixing water to the cement-aggregates and discharge of the mix shall not exceed 1 hour. At this temperature or above, particular attention shall be paid to the Specification provisions concerning the sprinkling and wetting of surfaces not oil-treated, the maintenance of coarse aggregate stock in saturated surface-dry condition, and the prompt start of concrete curing operations.

When the temperature of the plastic concrete reaches 90° F (32° C), immediate steps shall be taken to cool either mixing water or aggregates, or both, in order to maintain a plastic concrete temperature of 90° F (32° C) or less. Crushed or flaked ice may be used to cool the mixing water. Crushed or flaked ice may also be introduced into the mixing drum when the concrete is batched and mixed in a truck mixer. The ice will be considered as part of the mix water in the mix proportions. The mixing operation shall not be considered complete until all ice in the drum has melted.

In no event shall concrete be placed when its temperature in the plastic state

at the completion of mixing exceeds 90° F (32° C).

Bridge Decks: The Contractor's plan of action for all bridge deck concreting operations shall contain provisions designed to minimize the probability that any bridge deck concrete will be placed when the ambient temperature is greater than 85° F (30° C).

601.10-PLACING CONCRETE:

601.10.1-General: Concrete shall not be placed until forms and reinforcing steel have been inspected and approved. The forms shall be cleaned of all debris immediately prior to placing concrete, and surfaces not oil treated shall be wetted. The method and sequence of placing concrete will be subject to approval by the Engineer. Concrete shall be placed so that no segregation will occur and no displacement of reinforcement will be caused. Concrete shall be placed in the forms as nearly as practical in its final position in order to avoid rehandling, and an approximately horizontal surface of the plastic concrete shall be maintained. After initial set of the concrete, the forms shall not be jarred and no strain shall be placed on the ends of projecting reinforcement. Concrete shall not be placed until all laitance which may have formed on concrete previously placed, or any loose deleterious material on reinforcing bars, has been removed.

601.10.2-Chutes and Troughs: Concrete shall not be dropped in the forms a greater distance than 5 feet (1.5 meters) without the use of closed chutes or pipes. When chutes or troughs are used under steep slope conditions, they shall be equipped with baffle boards or shall be used in short lengths to reverse the direction of movement. All chutes, troughs or pipes shall be kept clean and free of hardened concrete by flushing with water after each run. Flushing water shall be discharged outside the forms. Aluminum chutes, troughs or pipes shall not be used.

601.10.3-Vibrating: Concrete shall be compacted by the operation of approved mechanical vibrators within the concrete. When required, vibrating shall be supplemented by hand spading to assure proper compaction, to force all coarse aggregate from the surface, and to bring mortar against the forms to produce a smooth finish. Vibrators shall be manipulated in such a manner that concrete is worked around reinforcement and imbedded features and into angles of the form. Vibration shall be of sufficient duration to accomplish compaction but shall not be prolonged to the point where segregation occurs. Vibration shall not be used to cause concrete to flow from point to point within forms.

601.10.4-Placing Concrete Bridge Decks: Concrete for bridge decks shall be placed and finished with mechanical equipment unless waived by the Engineer. The Contractor shall furnish the Engineer information as to the weight of the proposed machine, the volume of concrete to be placed per hour, and the operating procedure to be followed.

601.10.5

Where beam support screeds are used and the distance between the support and gutter line is in excess of 1 ft. (300 mm), the Contractor shall use devices to control the grade of the gutter line during the deck finishing operations.

601.10.5-Depositing Concrete Under Water: Concrete shall not be placed until all laitance which may have formed on concrete previously placed has been removed. Still water shall be maintained at the point of deposit. While depositing foundation concrete, pumping shall be discontinued if it results in a flow of water inside the forms. All concrete deposited under water shall have the minimum cement content increased at least 10 percent.

Concrete deposited under water shall be carefully placed in a compact mass in its final position by means of a tremie, a closed bottom dump bucket, or other approved method and shall not be disturbed after being deposited.

601.11-FINISHING CONCRETE SURFACES:

The surface of the concrete shall be finished immediately after form removal.

The exposed surfaces of bridge parapets, wingwalls and headwalls shall be given a Class 2, Rubbed Finish, or a Class 1 Ordinary Surface Finish supplemented with wood float rubbing. When the Class 1, Ordinary Finish is used, the forms shall be removed as early as practical, not to exceed six hours (in lieu of 601.8.7) after placing, and the finish completed including rubbing with a wood float and water. The rubbing shall produce a nonplastered, smooth textured and uniform color surface. **Other concrete surfaces except bridge decks shall be given a Class 1, Ordinary Finish.**

601.11.1-Class 1, Ordinary Surface Finish: Immediately following the removal of the forms, all fins and irregular projections shall be removed from all surfaces except those which are not to be exposed or are not to be waterproofed. On all surfaces the cavities produced by form ties and all other holes, honeycomb spots, broken corners or edges and other defects shall be thoroughly cleaned, saturated with water, and carefully pointed and trued with a mortar of cement and fine aggregate mixed in the proportions used in the class of concrete being finished. Mortar used in pointing shall be not more than 30 minutes old. The mortar patches shall be cured as specified in 601.12. All construction and expansion joints in the completed work shall be left carefully tooled and free of all mortar and concrete. The joint filler shall be left exposed for its full length with clean and true edges.

The resulting surfaces shall be true and uniform. All surfaces which cannot be repaired to the satisfaction of the Engineer shall be rubbed as specified for Class 2, Rubbed Finish.

601.11.2-Class 2, Rubbed Finish: After removal of forms, the rubbing shall be started as soon as the condition of the concrete will permit. The concrete shall be thoroughly saturated with water immediately prior to rubbing and shall be kept saturated throughout the rubbing operation.

Sufficient time shall have elapsed before wetting down to allow the mortar used in pointing to thoroughly set. Surfaces to be finished shall be rubbed with a medium coarse carborundum stone, using a small amount of mortar on its face. The mortar shall be composed of cement and fine sand in the same proportion as the concrete being finished. Rubbing shall be continued until all form marks, projections, and irregularities have been removed, all voids filled, and a uniform surface obtained. The paste produced by this rubbing shall be left in place. After all concrete above the surface being treated has been cast, the final finish shall be obtained by rubbing with a fine carborundum stone and water. This rubbing shall be continued until all the paste produced by the first rubbing operation has been removed from the face of the concrete except from depressions and defects which have been filled with the paste. The surface of the concrete after rubbing shall have a non-plastered, smooth texture and a uniform color.

After the final rubbing is completed and the surface has dried, the surface shall be rubbed with burlap to remove loose powder.

The resulting surfaces shall be free from all unsound patches, paste, powder, and objectional marks.

601.11.3-Class 6, Float Finish: This finish, for horizontal surfaces, shall be achieved by placing an excess of material in the form and removing or striking off the excess with a template, forcing the coarse aggregate below the mortar. Creation of concave surfaces shall be avoided. After the concrete has been struck off, the surface shall be thoroughly worked and floated with a suitable floating tool of wood, canvas or cork. Before the finish has set, the surface cement film shall be removed with a fine brush in order to have a fine grained, smooth but sanded texture.

601.11.4-Finishing Concrete Bridge Decks: Any addition of water to the surface of the concrete to assist in the finishing operations will not be permitted. When conditions are such that unusually rapid drying is occurring, an atomized mist may be used to prevent the rapid evaporation of water from the concrete surface during the final finishing.

After striking off, consolidating and floating have been completed, both while the concrete is still plastic, the surface shall be checked for trueness with a straightedge. The Contractor shall furnish an accurate scraping type straightedge with a minimum length of 10 feet (3.048 meter) and swung from a handle at least 3 feet (1 meter) longer than one-half the width of the slab.

The straightedge shall be held in successive positions parallel to the road centerline and in contact with the roadway surface and operated from side to side until the surface is within the permissible tolerance provided. Advance along the roadway shall be in successive stages of not more than one-half of the length of the straightedge. Any depressions found shall be immediately filled with freshly mixed concrete, struck-off, consolidated, and refloated. High areas shall be cut down and refloated. The straightedge testing and reflecting shall continue until the surface is found to be free from observable departures

601.12

from the straightedge and the slab has the required grade and contour.

Upon completion of the above operations, the surface shall be smoothed with a lute or smoothing float, four to 6 feet (1.2 to 1.8 meters) in length, after which the surfaces shall be tested with an accurate straightedge. This checking straightedge shall be 10 feet (3.048 meters) long and shall be held in a position parallel to the centerline of the roadway. The advance of this straightedge along the slab shall be in successive stages of not more than one-half of its length. When tested with this straightedge, the finished surface shall be free from observable departures from the straightedge.

Upon completion of the above operations, the surface of the concrete shall be given a groove finish while the concrete is still plastic. The tool used shall produce a groove that is approximately $\frac{3}{32}$ in. (2 mm) wide. The depth of this groove shall be $\frac{1}{8}$ in. (3 mm) to $\frac{3}{16}$ in. (5 mm) and spaced approximately $\frac{1}{2}$ in. (13 mm) center to center. The grooves shall be formed in a direction that is transverse to the centerline of the roadway or parallel to the skew. On any one bridge the direction of the grooves shall be consistent. Adjacent strokes to establish the texture shall abut one another without appreciable overlap. Texturing shall be performed when the concrete surface is of such plasticity as to prevent excessive raveling (concrete too dry) or to prevent mortar from flowing back into the grooves (concrete too wet). All texturing shall be accomplished with a single pass of the tool. To facilitate drainage, the 12 inches (300 mm) immediately adjacent to the curbline shall be left untextured.

When finishing has been completed and the concrete has hardened sufficiently, the surface shall be given a further test for trueness with a rolling straightedge. Areas showing high spots of more than $\frac{1}{8}$ in. (3 mm) shall be marked by the Engineer and, only when directed by the Engineer, such areas shall be ground with an approved grinding tool, utilizing carborundum stones or industrial diamond wheels; grinding shall be done to an elevation where the area or spot will not show a surface deviation in excess of $\frac{1}{8}$ in. (3 mm) when tested with the 10 ft. (3.048 meter) rolling straightedge, except that the maximum depth of grinding shall not exceed $\frac{1}{4}$ in. (6 mm). The ground areas shall be treated as directed by the Engineer. Where the initial deviation from the straightedge is $\frac{1}{2}$ in. (13 mm) or more, the Contractor will be required to remove and replace the complete pour in which the areas not meeting the required tolerance are located.

After grinding, all areas either high or low, not meeting the requirements of $\frac{1}{8}$ in. (3 mm) tolerance will be measured and disposition of these areas will be as set forth in 601.15.2.

601.12-CURING AND PROTECTING CONCRETE:

601.12.1-Curing Under Normal Conditions: All concrete shall be protected by one or more of the curing materials, meeting the requirements of 601.2, as soon as possible after placement to prevent loss of moisture from the surface. Burlap and water curing shall be used on all bridge decks.

Concrete surfaces shall be kept completely and continuously moist. Curing shall be continued for a period of at least 7 days. This curing period may be

reduced if the contractor presents evidence that the in place concrete has attained 70% of the specified strength for the class of concrete under cure. Under no circumstances, shall the period of cure be less than 3 days. The reduced curing period option is not applicable to Class K concrete placed in bridge decks. Surfaces may have coverings temporally removed for finishing, but the covering shall be restored as soon as possible.

Membrane forming curing compounds may be used providing they do not conflict with other requirements of these Specifications. If membrane forming curing compound is used, all surfaces shall be given the required finish prior to application of the curing compound with the concrete protected by some other method before finishing.

Curing compound shall be applied at a minimum rate of one gallon of liquid coating per 300 sq. ft. (13.6 liters of liquid coating per 100 m²) of concrete surface for each application. The curing compound shall be continuously agitated during use. All concrete cured by this method shall receive two applications of the curing compound. The first coat shall be applied immediately after acceptance of the concrete finish. If the surface is dry, the concrete shall be saturated with water and the curing compound applied as soon as the surface film of water disappears. The second application shall be made after the first application has set. Placement in more than two coats may be required to prevent streaking.

During the curing period, any coating marred or otherwise disturbed shall be given an additional coating. Should the surface coating be subjected continuously to injury, another method of cure shall be immediately substituted. If the use of an impervious compound results in a streaky or blotched appearance, the method shall be stopped and water curing applied until the cause of the defective appearance is corrected.

601.12.2-Curing Under Cold Weather Conditions: When the air temperature is expected to fall below 30° F (-1° C), the Contractor shall provide suitable measures to maintain the concrete surface temperature between 50° F (10° C) and 90° F (32° C).

Calendar days on which the surface temperature of the concrete falls below 50° F (10° C) shall not be considered days of curing. In no event shall the temperature of the concrete be allowed to fall below 35° F (2° C) before the specified curing is completed. The Contractor shall be responsible for the quality and strengths of the concrete placed or cured, or both, during the cold weather, and any concrete injured by frost action shall be removed and replaced at the Contractor's expense.

When protection is removed from the structure after the specified curing is complete, the temperature of the concrete shall not be permitted to fall at a greater rate than 20° F (11° C) per 24 hour period.

601.12.3-Protection of Finished Surfaces: All exposed finished surfaces of concrete shall be protected to prevent rust stains, paint splotches, scars or

601.13

other blemishes tending to disfigure or discolor the finished surface. Where reinforcing steel bars or other steel inserts are left exposed for extended periods or over the winter, they shall be given a coat of neat cement paste to prevent rust staining.

Any stains or other blemishes shall be corrected by the Contractor.

601.13-PROTECTIVE SURFACE TREATMENT:

601.13.1-Linseed Oil: After the concrete is at least 14 days old, a protective surface treatment as specified shall be applied to the entire top surface of bridge decks, approach slabs when they are included in the Contract, concrete bridge medians, top and curb face of bridge sidewalks, and inside faces of parapets.

The surface shall be dry for at least 48 hours before treatment and shall be free from oil, grime, and loose dirt or particles. Immediately before application, the entire surface shall be air blown to remove any loose dust.

The surface treatment mixture shall consist of 50 percent boiled linseed oil and 50 percent petroleum spirits (mineral spirits), by volume.

The mixture shall be sprayed, and the nozzle shall be kept within 18 inches (450 mm) of the surface. Hand tank type pressure sprayers will be permitted.

The temperature of the concrete and air shall be 50° F (10° C) or higher at the time of application.

The first coat shall be applied at the rate of 0.025 gal. per sq. yd. (40.0 sq. yd. per gal.) (0.11 liters per square meter (8.8 m² per liter)) and the second coat at the rate of 0.015 gal. per sq. yd. (67.0 sq. yd. per gal.) (0.068 liters per square meter (14.7 m² per liter)).

The second coat shall not be applied until the concrete has regained its dry appearance.

The Contractor is cautioned to guard against fire of all sorts, including cigarettes, as this material is flammable.

Metal hand rails shall be protected from spray by shielding or masking.

The Contractor shall prohibit all pedestrian or vehicular traffic on the structure during the drying period of the protective coating.

The Contractor shall not apply a protective coating when it is anticipated that there will be precipitation within five hours of the time of application. Any coating damaged by rain or moisture shall be corrected by an additional application.

601.13.2-Epoxy Resin Protective Coating: The top surface of abutment bridge seats, including drainage areas, and the adjacent bottom 6 inches (150 mm) of the backwall and the top surface of pier caps which are located beneath expansion devices shall receive an epoxy resin protective coating. The area immediately beneath the bearing masonry plates may be omitted at the Contractor's option.

Concrete surfaces to be coated shall be sound, dry and free of all laitance and curing materials. The coating shall not be applied until the concrete has attained the age recommended by the manufacturer.

When required by the Engineer in the field, concrete surfaces shall be cleaned of all oil, grease and other potential bond inhibiting matter by acid etching with a 10 percent to 15 percent muriatic acid solution. The acid solution shall be spread and allowed to react until bubbling has subsided, approximately three to five minutes. The surface shall then be thoroughly flushed with clear water and allowed to dry. Where, in the opinion of the Engineer, acid etching is insufficient to clean the concrete, then sandblasting or an approved method of mechanical abrading shall be required.

The exact indicated amounts of the base polymer and the reacting system, as recommended by the manufacturer, shall be measured into mixing container and mixed thoroughly with a low-speed paddle-type mixer. After mixing, the material shall stand for an induction period of one hour before application.

Following the one hour induction period, the mixed protective coating may be applied by brush, roller or spray. When applied by roller, a first quality, long nap roller is recommended for rough surfaces, and a short nap roller for smooth surfaces. If applied by spray, an externally atomized spray gun is recommended. If thinning is necessary for spray application, thinner shall be of the type and amount recommended by the coating manufacturer.

Two coats of mixed material shall be applied in thin, uniform coats of approximately 2 to 3 mil (50 μm to 75 μm) dry film thickness each (4-5 mils wet thickness (100-125 μm wet thickness)). The second coat shall be applied approximately 24 hours after the application of the first coat. One gallon of the system will cover approximately 275 sq. ft. of smooth concrete, first coat; a second coat will cover approximately 400 sq. feet. One liter of the system will cover approximately 6.75 m^2 of smooth concrete, first coat; a second coat will cover approximately 10 m^2 .

In all cases application shall be made at temperatures recommended by the manufacturer.

601.14-METHOD OF MEASUREMENT:

The quantity of work done for Class A, Class K, Class B, Class C and Class D concrete will be measured in cubic yards (meters), complete in place and accepted, as determined by the dimensions on the Plans or contract documents, and will be the number of cubic yards (meters) established in the Proposal, subject to adjustment as provided for in 104.2 and 109.2.

No deductions will be made for the volume occupied by pipe less than 8 inches (200 mm) in diameter, nor for reinforcing steel, anchors, conduits, weep holes or piling, or other small inserts.

601.15

The cost of copper, copper-nickel alloy or other type of flashing, expansion joint filler, preformed joint filler, concrete bearing pads, drain pipes for weep drains through abutments, wings and walls or bridge floors, unless otherwise specified, shall be included in the unit prices bid for the several classes of concrete.

601.15-BASIS OF PAYMENT:

601.15.1-General: The quantities, determined as provided above, will be paid for at the contract unit prices bid or at the adjusted percent of contract price as specified for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, field laboratory, supplies and incidentals necessary to complete the work.

No additional payment will be allowed for concreting under adverse weather conditions nor when the use of a higher class concrete than that specified is permitted.

601.15.2-Price Adjustments: The Contractor will be assessed an equitable deduction of fifteen dollars per sq. ft. (one-hundred-sixty dollars per square meter) for areas of bridge decks not meeting the specified 1/8 in. (3 mm) tolerance and not specified to be removed nor directed to be ground, and for any areas that have been ground but do not meet the specified tolerance. Deviations will be tested with a 10 foot (3.048 meter) rolling straightedge.

Concrete found not in compliance with the requirements of 601.4.4 for compressive strength will be paid for at a reduced contract price in accordance with the following formula:

Percent Reduction
$$= \frac{f'_c - X}{f'_c - (f_c + s)}$$

Where:

- f'_c = Design Strength, psi (MPa)
- X = Observed strength, psi (MPa)
- s = Standard Deviation
- f_c = Design Stress

The percent reduction shall be applied to the subplot with the low strength.

601.16-PAY ITEMS:

SECTION 602

REINFORCING STEEL

602.1-DESCRIPTION:

This work shall consist of furnishing and placing epoxy coated or uncoated reinforcing steel in accordance with these Specifications and in reasonably close conformity with the Plans.

602.2-MATERIALS:

Reinforcing steel bars and fabric reinforcement shall meet the requirements of 709.1 and 709.4 respectively, except rail-steel shall not be used in bridge decks or parapets.

Epoxy coated reinforcing steel bars shall meet the requirements of 709.1.2, except rail-steel shall not be used in bridge decks and parapets.

CONSTRUCTION METHODS

602.3-ORDER LISTS:

All order lists and bending diagrams shall be furnished by the Contractor. If requested by the Engineer, order lists and bending diagrams shall be submitted for approval. Approval of order lists and bending diagrams by the Engineer shall in no way relieve the Contractor of responsibility for the correctness of such lists and diagrams.

602.4-PROTECTION OF MATERIALS:

Steel reinforcement shall be stored above the well drained surface of the ground upon platforms, skids, or other supports and shall be protected from mechanical injury. Reinforcement shall be free from injurious defects such as cracks and laminations. Any loose scale, loose rust, dirt, paint, grease, oil or other foreign materials present on the reinforcement shall be removed by wire brushing, sand blasting or other approved methods before the placement of concrete.

Reinforcing steel which will be exposed over the winter shall be protected, within one week after the placing of the initial concrete, with a brush coat of neat cement, mixed with water to a consistency of thick paint. This coating shall be removed by lightly tapping with a hammer or other tool not more than one week before the placing of the adjacent pour.

602.5-BENDING OF REINFORCING BARS:

Unless otherwise permitted, all reinforcing bars shall be cold bent in the shop. Bars partially embedded in concrete shall not be field bent except when shown on the Plans or permitted by the Engineer. Only competent men shall be employed for cutting and bending, and proper appliances shall be provided for the work.

Bending shall be in accordance with the Manual of Standard Practice for Detailing, Reinforced Concrete Structures, ACI 315, latest revision. Rail-steel bars shall not be field bent or straightened.

Rail-steel bars shall not be field bent or straightened.

602.6-PLACING AND FASTENING:

602.6.1-General: All reinforcing steel shall be accurately placed and, during the placing of concrete, firmly held by supports in the position shown on the Plans. Reinforcing bars shall be securely fastened together. Bars shall be tied at all intersections except where spacing is less than 1 ft. (300 mm) in each direction, in which case alternate intersections shall be tied. Distance from the forms shall be maintained by means of stays, blocks, ties, hangers, chairs, or other approved supports. Blocks for holding reinforcement from contact with forms shall be precast mortar blocks of approved shape and dimension; the use of pebbles, broken stone, metal pipe or wooden blocks will not be permitted. Reinforcement in any member will be inspected and approved before any concrete is placed.

602.6.2-Epoxy Coated Bars: Epoxy coated bars shall be placed on plastic coated wire supports. Supports shall be installed in a manner to prevent planes of weakness in the hardened concrete. The reinforcing steel shall be held in place by use of plastic or plastic coated tie wires especially fabricated for this purpose.

Any visible damage to the epoxy coating of the reinforcing steel that occurs during shipment, storage and installation of the steel shall be repaired. The patching Supplier shall furnish patching material to the project with the first shipment of epoxy coated steel. The patching material shall be prequalified as required for the coating material and shall be either identified on the container as meeting the requirements of AASHTO M284, Annex A or shall be accompanied by a Certificate of compliance. Patching of damaged areas shall be performed in accordance with the patching material manufacturer's recommendations.

In the event it is anticipated that the epoxy bars will be stored on the project site, and/or placed in final position without the concrete cover for a period of 90 days or more, then the bars shall be stored in a temporary shed or covered with plastic to prevent damage to the epoxy coating due to ultra-violet rays or other atmospheric conditions. Any temporary storage means used, shall provide adequate ventilation to the bars to prevent the build up of moisture on

the bar surface.

602.7-BAR SPLICES:

602.7.1-Lapping: All reinforcement shall be furnished in full lengths as indicated on the Plans. No splicing of bars, except where shown on the Plans, will be permitted without the written approval of the Engineer. Lapped splices shall have a length of lap not less than 30 bar diameters and shall be well distributed or located at points of low tensile stress. The bars shall be rigidly clamped or wired at all splices in a manner approved by the Engineer.

602.7.2-Welding: Splicing by welding of reinforcement will be permitted only if detailed on the Plans or if authorized by the Engineer in writing. Welding shall comply with the current specifications of the American Welding Society, D 1.4, and the weld shall develop an ultimate strength equal to or greater than that of the bars connected.

602.7.3-Mechanical Splice Connectors: Mechanical splice connectors shall develop in tension or compression at least 125 percent of the specified yield strength of the bar.

602.8-FABRIC REINFORCEMENT:

Mesh sheets or uncoated reinforcing steel, except steel mesh, will be measured by the pound (kg), based on Plan lengths and numbers of bars, using the unit weights in Table 602.9. The quantity for payment will be the number of pounds (kg) established in the Proposal, placed as shown on the Plans or directed, complete in place and accepted, subject to adjustment as provided for in [104.2](#) and [109.2](#).

602.9-METHOD OF MEASUREMENT:

Epoxy coated or uncoated reinforcing steel, except steel mesh, will be measured by the pound (kg), based on Plan lengths and numbers of bars, using the unit weights in Table 602.9. The quantity for payment will be the number of pounds (kg) established in the Proposal, placed as shown on the Plans or directed, complete in place and accepted, subject to adjustment as provided for in [104.2](#) and [109.2](#).

TABLE 602.9

Bar Designation	Weight Per Lin. Ft. in Lb. (<u>Mass</u> kg per meter)	Bar Designation	Weight Per Lin Ft. in Lb. (<u>Mass</u> kg per meter)
# 3 (10)	0.376 (.560)	# 9 (29)	3.400 (5.060)

# 8 (25)	2.670 (3.973)		

If the Engineer allows the substitution of bars larger than those specified, payment will be made for only the amount of steel which should have been required if the specified bars had been used.

If the Contractor, for convenience in transporting or placing steel, is permitted to use bar lengths shorter than those shown on the Plans, the weights paid for will be based on the lengths shown on the Plans with no allowance for extra laps. No direct payment will be made for metal chairs, spacers, clips, wire, or other mechanical means used for fastening or holding reinforcement in place; the cost of these devices shall be included in the contract price for the reinforcing steel.

The cost of furnishing and placing steel mesh, if required, shall be included in the contract unit price for the concrete in which it is placed and no further payment will be made.

602.10-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which price and payment shall be full compensation for furnishing, fabricating, transporting, storing and placing epoxy coated or uncoated reinforcing steel; and the furnishing of all other materials and doing all the work described in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

602.11-PAY ITEMS:

ITEM	DESCRIPTION	UNIT

602002-*	EPOXY COATED REINFORCING STEEL BAR	POUND (KILOGRAM)

* Sequence Number

SECTION 603

PRESTRESSED CONCRETE MEMBERS

603.1 DESCRIPTION:

This work consists of the construction of precast/prestressed concrete members, pretensioned in accordance with these specifications and in conformity with the plan details and notes. This work shall include manufacturing, inspection, handling, storing, transporting and erecting of structural members of precast/prestressed concrete, and, when specified, shall also include precast concrete members which do not contain pretensioning steel components.

Concrete floors, curbs, parapets, curtain walls, and diaphragms shall be cast in place on the project unless otherwise provided for on the plans. When the above elements are specified as precast members, they shall be manufactured in accordance with this specification.

603.2 MATERIALS

603.2.1 Materials Details: Materials shall meet the requirements specified in the following Sections/Subsections:

Precast / Prestressed Concrete Materials	Sections / Subsections
Cement	701.1, 701.3
#Fine Aggregates	702.1
*Coarse Aggregates	703.1, 703.2, & 703.3
+Admixtures:	
Air Entraining Admixtures	707.1
Retarding Admixtures	707.2
Water Reducing Admixtures	707.3
**Pozzolonic Additives	707.4
Mixing Water	715.7
Reinforcing Steel	709.1
Prestressing Steel	709.2
Hot-Poured Elastic Type Concrete Joint Sealer	708.3
Preformed Expansion Joint Filler	708.1
Elastomeric Bearing Pads	715.14
Welded Wire Fabric	709.4

603.2.2

Steel Bolts and Nuts..... 709.23

Concrete Sealant..... 707.12

Shear-Key Grout..... 715.5

#Fine aggregate shall be natural sand.

*The maximum size of coarse aggregate shall not exceed the minimum horizontal or vertical clear spacing between pretensioned or reinforcing steel elements divided by 1.33.

Lightweight aggregates shall not be used unless their use is permitted by the Engineer in writing.

**The use of a pozzolonic additive is not permitted when a blended hydraulic cement is used. Unless otherwise permitted by the Engineer, only one source of a pozzolonic additive shall be used.

+ Calcium chloride or any admixture containing chloride ion in excess of 0.1 percent by weight shall not be used in prestressed concrete members.

603.2.2 Inspection and Testing: A representative of the Engineer shall have free entry at all times, while the work on the Contract is being performed, to all parts of the manufacturer’s works which concern the manufacture of the materials ordered. The manufacturer shall afford the representative of the Engineer, without charge, all reasonable facilities to satisfy themselves that the material is being furnished in accordance with these specifications.

603.3 PLANT REQUIREMENTS AND APPROVAL:

603.3.1 Plant Approval: All fabricators of prestressed concrete members shall be certified in the appropriate Group and Category in accordance with the Precast/Prestressed Concrete Institute (PCI) Plant Certification Program. Fabricators shall be certified in Group B3 or B4 for manufacture of prestressed straight strand bridge members. For prestressed draped strand bridge members, the fabricator shall be certified in Group B4. The Engineer or his authorized representative shall approve all plants manufacturing prestressed and precast reinforced concrete bridge members before manufacture of the members may be started. Requests for such approvals shall be submitted to the Engineer at least three weeks prior to the date of manufacture of the members. Requests shall include details of the plant facilities, materials, and the production methods the manufacturer intends to use.

The manufacturer shall have an established quality control program in effective operation at the plant. This program shall be submitted to the Engineer for approval at least 30 days prior to the start of the production.

If a contractor/fabricator is found to consistently deviate from PCI guidelines, the contractor/fabricator will be required to use independent laboratory quality control testing and inspection until it can be shown that conformity with PCI guidelines has been reestablished. The laboratory used is

subject to the approval by the Engineer. The cost of the independent laboratory is to be borne by the contractor/fabricator.

603.3.2 Supervision: The contractor/fabricator shall provide a PCI Level II certified technician, skilled in the use of the system of prestressing to be used, who shall supervise the work and give the Engineer or his representative such assistance as may be considered necessary.

603.3.3 Equipment and Tools:

603.3.3.1 General: All equipment, tools and machinery used in the work shall be adequate for the purpose for which it is to be used and shall be maintained in a satisfactory working condition. The use of portable pretensioning beds for the manufacture of prestressed concrete members is not acceptable.

The contractor/fabricator shall provide all other equipment and tools necessary for the construction and the prestressing.

603.3.3.2 Equipment: The jacks shall be equipped with instruments for monitoring the hydraulic pressure. Electronic pressure transducers with digital indicators may be used. All pressure gauges or electronic pressure indicators shall indicate the load directly to one (1) percent of the maximum gauge or sensor/indicator capacity or (2) two percent of the maximum load applied, whichever is smaller.

Each jack and its gauge shall be calibrated as a unit with the cylinder extension in the approximate position that it will be at final jacking force. The calibration of the jack and gauge shall be done while the jack is in the identical configuration as will be used on the site, e.g., same length hydraulic lines. An independent laboratory shall furnish certified calibration charts with each jack and gauge used in the work. Certified calibration of each ram shall be made prior to the start of stressing operations and every six (6) months thereafter, or as requested by the Engineer. Any repair of the rams, such as replacing seals, changing length of hydraulic lines, changing type of pump or using gauges which have not been calibrated with the ram, shall be cause for recalibration of the jack and gauge with a load cell. No extra compensation will be allowed for the initial or subsequent ram calibrations.

603.3.3.3 Forms and Casting Beds: Forms and casting beds shall be subject to the approval of the Engineer. Unless otherwise approved, only metal forms on concrete founded casting beds shall be used. The forms and casting beds shall be well constructed, carefully aligned, substantial and firm, securely braced and fastened together, sufficiently tight to prevent leakage of mortar and strong enough to withstand the action of mechanical vibrators. The forms shall be constructed to permit movement of the members without damage during release of the prestressing force or movement caused by thermal expansion during curing. The casting beds and all form work will be approved before any

603.4

concrete is placed, but such approval shall not relieve the contractor/fabricator of responsibility for the results obtained.

603.4 WORKING DRAWINGS:

603.4.1 General: The contractor/fabricator shall expressly understand that the Engineer's approval of the working drawings submitted by the contractor/fabricator covers the requirements for "strength and detail," and that the Engineer assumes no responsibility for errors in dimensions.

Working drawings must be approved prior to performance of the work involved and such approval shall not relieve the contractor/fabricator of any responsibility under the contract for the successful completion of the work.

All working drawings shall be in English units. Use of dual (metric and English) units is not allowed.

603.4.2 Shop Drawings: The contractor/fabricator shall submit copies of the detailed shop drawings to the Engineer for approval. Shop drawings shall be submitted sufficiently in advance of the start of the work to allow time for review by the Engineer and corrections by the contractor/fabricator without delaying the work. The size of the original drawings shall be 22 in. x 34 in. (559 mm x 864 mm) including margins, unless otherwise permitted. The shop drawings submitted for approval may be reduced.

Shop drawings for concrete structures shall give full detailed dimensions and sizes of component parts of the structure and details of all miscellaneous parts.

603.4.3 Erection Drawings: The contractor shall submit drawings illustrating fully their proposed method of erection. The drawings shall show details of all falsework bents, bracing, guys, dead-men, lifting devices, and attachments to the bridge members: sequence of erection, location of cranes and barges, crane capacities, location of lifting points on the bridge members, and weights of the members. The plan and drawings shall be complete in detail for all anticipated phases and conditions during erection. Design calculations, sealed by a Registered Professional Engineer, shall be submitted by the contractor/fabricator to the Engineer for approval which will demonstrate that allowable stresses for falsework and concrete members being erected are not exceeded and that member capacities and final geometry shall be correct.

When the designated concrete deck overhang exceeds 30 inches (760 mm), the erection drawings submitted by the contractor/fabricator shall include complete details of the forming and bracing for the overhang and shall transmit the concrete deck dead load to an area of the beam or stringer which will prevent distortion. All forming and bracing procedures are subject to approval of the Engineer.

603.5 REINFORCEMENT:

All reinforcing bars and welded wire fabric shall meet all requirements of Section 602 and shall be free of frost, loose rust, grease, dirt, oil, paint, mill

scale, corrosion or other deleterious substances. Any steel which can not be satisfactorily cleaned shall not be used.

When splicing is required, all reinforcing bars shall be lapped for a length of at least 30 bar diameters.

Reinforcing bars, welded wire fabric and other embedded fixtures shall be accurately placed as indicated on the Plans and shall be maintained in their correct position during the manufacture of the unit. Reinforcement shall not be held in position by tack welding.

The minimum concrete cover for reinforcing steel shall be as follows, unless otherwise shown on the Plans:

Main Reinforcement	1 ½ in.(40 mm)
Slab Reinforcement, top of slab	1 ½ in. (40 mm)
Slab Reinforcement, bottom of slab	1 in (25 mm)
Stirrups and Ties	1 in. (25 mm)

The longitudinal or main wires of welded wire fabric shall be placed transverse to the longitudinal axis of the unit. Laps of welded wire fabric shall be a minimum of 6 inches (150 mm) unless otherwise approved by the Engineer.

603.6 CONCRETE:

603.6.1 General: The composition, proportioning, and mixing of concrete shall be such so as to produce a homogeneous concrete mixture of a quality that will conform to the test and design requirements specified and as noted on the Plans. Concrete for all prestressed members shall have a minimum compressive strength as may be specified on the plans or in the special provisions. Materials used to form voids in the members shall be fabricated from form material acceptable to the Engineer or from cardboard, which has been treated with a waterproofing agent. Any void made from more than one piece of material shall be glued and banded to prevent separation during concreting operations. Any evidence of separation will be cause for rejection. All concrete materials including admixtures shall meet requirements specified in subsection 603.2 and/or as indicated in the plans.

603.6.2 Mix Design: Concrete mixtures must be established initially by methods in accordance with ACI 318, Chapter 4. Mixes may be designed either by a commercial laboratory or by PCI certified concrete plant personnel. Prior to adoption of a mix design as a plant standard, it shall be field tested by use of the production plant batching and mixing equipment, construction methods, and curing to be used in production of the members. The use of a previous mix design can be approved for a project if sufficient test data (30 or more tests) are available from the past year for evaluation (ACI 301, Chapter 3,method).

All design mixes shall be developed using the type of cement, the type and gradation of aggregates, and admixtures proposed for use in plant mixes. When any of these variables are changed, the proposed mix shall be reevaluated. The mix design shall be approved by the Engineer.

603.6.3 Proportioning of Concrete: Materials shall be proportioned by weight, unless otherwise authorized by the Engineer. The concrete shall contain the minimum amount of water per sack of cement required to obtain satisfactory workability and the specified minimum strength, but in no case shall this amount exceed five gallons per sack (0.44 liter per kg) of cement, including the free water in the aggregate, and /or admixtures. The minimum cement factor shall be seven bags per cubic yard (390 kg per m³) of concrete. Concrete for all members shall be air-entrained with a target air content of seven percent. A working tolerance of plus or minus two percentage points will be allowed. When the ambient temperature is 90 °F (32° C) or higher, a retarding admixture shall be added to the concrete mixture. The Engineer may permit the use of retarding or water-reducing admixture when necessary. Slump shall not exceed 8 inches (200 mm) with the use of high range water reducers

603.6.4 Sampling and Test Methods:

Sampling Freshly Mixed Concrete	AASHTO T 141
Slump of Hydraulic Cement Concrete.....	AASHTOT 119
Air Content of Freshly Mixed Concrete.....	AASHTOT 121
	AASHTOT 152
	or ASTM C
	173

Compressive Strength of Cylindrical Concrete Specimens	AASHTO T 22
*Making and Curing Concrete Test Specimens in the Field.....	AASHTO T 23

*Cylinders shall be manipulated and cured by methods identical to those used in curing the concrete members.

603.6.5 Strength of Concrete: A strength test shall consist of the average strength of three compressive strength test cylinders fabricated from a single randomly selected batch of concrete, as it is being placed in the forms except that, if any cylinder should show evidence of improper sampling, molding or testing, said cylinder shall be discarded and the strength test shall consist of the strength of the remaining cylinder. At least one set of cylinders shall be tested for each member cast in a form. Each set shall be from a separate batch of concrete.

603.6.6 Batching and Mixing: Concrete batching plants and their operation shall be in conformance with ASTM C 94, “Specifications for Ready-Mix Concrete”. Concrete batch plants shall be capable of producing concrete of the quality required and they shall be adequately equipped and properly operated. Concrete supplied to the plant by an outside batch plant shall meet the same requirements of batch plant facilities. Evidence of conformance will be certification of the outside plant by the National Ready-Mix Concrete

Association (NRMCA).

Fine and coarse aggregates and cement shall be measured by weight. Water and liquid admixture may be measured by either weight or volume. Measurement of the various components of concrete, and measuring equipment shall be in accordance with ASTM C 94.

Concrete shall be mixed by one of the following methods:

1. Central mixed concrete - concrete mixed in a central stationary mixer and delivered to the casting area by appropriate methods.
2. Shrink mixed concrete - concrete that is partially mixed in a stationary mixer, then mixed completely and delivered to the casting site in a truck mixer.
3. Truck mixed concrete - concrete that is completely mixed in a truck mixer as it is delivered to the casting site.

Mixing times shall be established by uniformity tests in accordance with procedures in ASTM C 94.

603.6.7 Placing Concrete: Suitable means shall be used for placing concrete without segregation. The concrete mixture shall not be dropped from a distance of more than 4 feet (1.2 meters), relative to the top of the form or the reinforcement. Special care shall be taken to deposit the concrete in its final position in each part of the form. Working of flowing concrete along the forms from the point of deposit will not be permitted. Care must be taken to work the concrete under and around the prestressing strands and reinforcement. The plastic concrete shall be consolidated in place by either external or internal vibration, or both when necessary. The vibrators shall be of a type and design approved by the Engineer, and the size of the vibrating head will be governed by the spacing of the prestressing cables and reinforcement. Vibrators may be used only to consolidate the concrete after it has been properly placed.

Internal vibrators shall be operated vertically and shall be slowly pushed into and pulled out of the concrete and shall not be held in one spot long enough to cause segregation. Concrete segregated by the vibrator shall be removed and discarded. Partially hardened layers of concrete shall not be penetrated or disturbed by the vibrator. Transmission of vibration into prestressing cable or reinforcement embedded in partially hardened concrete by the vibrating equipment will not be permitted.

603.6.8 Cold Weather Production: In addition to the requirements of Subsection 601.9.1, the following requirements shall apply to outdoor casting operations. When ambient temperatures below 40° F (4° C) are anticipated, the following shall be used as necessary to keep the temperature of concrete within the prescribed limits:

1. Minimum concrete temperature shall be 50° F (10° C) after placement.
2. Concrete shall not be placed on cold forms, steel, or appurtenances.

603.6.9

When the temperature of these facilities are below 40° F (4° C), steam heat or other means shall be provided to maintain the temperature to at least 50° F (10° C) unless concrete is delivered above 60° F (15° C) and no frost, snow or ice is present in the form.

3. Placing concrete under covers or in suitable enclosures.
4. Use of heated mixing water.
5. Avoidance of the use of frozen aggregate or aggregate containing frost, snow or ice.
6. Use of insulated forms.

603.6.9 Hot Weather Production: In addition to the requirements of Subsection [601.9.2](#), the following requirements shall apply to outdoor casting operations:

When the ambient temperature is above 100° F (38° C), or other adverse weather conditions are present, it is recognized that plastic shrinkage of concrete, or loss of strength below specification requirements, or both may occur. If such conditions do occur, the following procedures or combination of procedures shall be used as necessary to correct these deficiencies:

1. Water fog spraying of forms, prior to placement of concrete. Forms exposed to direct sunlight can be misted for cooling prior to placement of concrete.
2. Shaded storage for aggregates.
3. Burying, insulating or shading water supply facilities.
4. Sprinkling or fog spraying of aggregates.
5. Use of shaved or crushed ice for a portion of the mixing water. Only so much ice shall be used as will be entirely melted at the completion of the mixing period.
6. Use of cold water in batching. Water can be chilled and stored in an insulated tank or pulled from a source if temperatures are low enough to aid mix temperature reduction.
7. Application of wet burlap or mats or fog spraying as soon as the water sheen disappears from the concrete. This is especially important for hot, windy, exposed locations.
8. Use of white pigmented curing compound for its heat-reflective properties except on composite surfaces.
9. Use of self-retarding admixtures.
10. Avoidance of the use of cement with temperatures over 170° F (77° C).
11. Shading of product surface during and after casting to avoid heat buildup in direct sunlight.

Concreting operations shall be discontinued when concrete temperatures exceed 100° F (38° C) at the time of placing.

603.7 PRESTRESSING:

603.7.1 Protection of Prestressing Steel: All prestressing steel shall be protected against physical damage and rust at all times during storage and manufacturing. Prestressing steel shall also be free of deleterious material such as grease, oil, wax, or paint, except where called for on the plans. Prestressing steel that has sustained physical damage at any time shall be rejected. The use of prestressing reinforcement having kinks, bends, nicks, or other defects will not be permitted. The development of pitting, other than slight rusting shall be cause for rejection.

Prestressing steel shall be packaged in containers or shipping forms for the protection of the strand against physical damage and corrosion during shipping and storage. A corrosion inhibitor which prevents rust or other results of corrosion shall be incorporated in a corrosion inhibitor carrier type packaging material, or when permitted by the Engineer, may be applied directly to the steel. The corrosion inhibitor shall have no deleterious effect on the steel or concrete or bond strength of steel to concrete.

The shipping package or form shall be clearly marked with a statement that the package contains high strength prestressing steel, and the type of corrosion inhibitor used, including the date packaged.

All anchorages, end fittings, couplers, and exposed strands, which will not be encased in concrete or grout in the completed work, shall be permanently protected against corrosion.

If an anti-bonding agent is used on the forms to facilitate member removal, every precaution shall be taken to protect the prestressing strands against any degree of coating by the anti-bonding agent.

603.7.2 Storing of Prestressing Steel: Prestressing steel shall be stored in a protected area which includes a roof (and sides if necessary) to keep moisture off the strand. In addition the cover must have a floor or at least the strand must be placed on supports to keep it out of mud and water until it is to be used. It shall not be removed from its protective packaging until immediately prior to installation in the forms and placement of concrete. Openings in the packaging shall be resealed as necessary to protect the unused steel. While exposed, the steel shall be protected to prevent corrosion.

603.7.3 Placement of Prestressing Steel: Prestressing shall be accurately installed in the forms and held in place by the stressing jack or temporary anchors and, when tendons are to be draped, by hold-down devices. The hold down devices used at all points of change in slope of tendon trajectory shall be of a low-friction type.

603.7.4 Safety Measures: Effective safety measures shall be taken to prevent injuries to personnel due to the breakage of strands or failure of anchorage devices during the tensioning operations. The protection provided shall be adequate and shall permit the inspector to perform his normal duties. When the safety precautions, in the opinion of the Engineer, are inadequate the

603.7.5

contractor will revise the procedures or equipment to the satisfaction of the Engineer. The inspector will abide by the safety rules established by the producer.

603.7.5 Stressing Requirements:

603.7.5.1 General: The provisions set forth in this section refer to the application and measurement of stresses to prestressed concrete members manufactured by the process of pretensioning. Prestressing forces shall not be transferred to any member nor shall end anchors be released before the concrete has attained a minimum compressive strength as specified on the plans or in the special provisions as determined by tests of standard cylinders cured identically as the member.

An initial force shall be applied to each strand such as to develop a load of approximately 10% of the final prestressing load as shown on the plans. A record shall be maintained of the jacking force and elongations thereby. Several prestressed members may be cast in one continuous line and stressed at one time.

Forms shall be removed and members detensioned immediately after steam curing or heat curing is discontinued while the concrete is still warm and moist. The elements shall be cut or released in an order such that lateral eccentricity of prestress forces will be a minimum.

603.7.5.2 Tensioning of Strands: In all methods of tensioning, stress induced in the strands shall be determined by monitoring applied force and independently by measurement of elongation. Applied force may be monitored by direct measurement using a pressure gauge piped into the hydraulic pump and jack system. The elongation measurements shall agree with their computed theoretical values within a tolerance of $\pm 5\%$. If discrepancies are in excess of 5% between the calculated forces, determined by elongation measurement and gauge reading, the tensioning operation shall be suspended and the source of error determined, evaluated, and corrected by qualified personnel before proceeding.

Calculations for elongation and gauge readings must include appropriate allowances for friction in the jacking system, strand seating, movement of bulkheads, bed shortening if under load, thermal corrections, and any other compensation for the setup.

603.7.5.3 Methods of Stress Measurement: Methods of measurement of the stressing force consist of pressure gauges to measure force from the pressure applied to hydraulic jacks or any other method approved by the Engineer.

603.7.5.4 Gauging Systems: Hydraulic gauges shall conform to the provisions set forth in Section 603.3.3. All gauges measuring the stressing load shall be graduated so they can be read within a tolerance of $\pm 2\%$.

Tensioning methods employing hydraulic gauges shall have appropriate bypass valve snubbers and fittings so that the gauge pointer will not fluctuate but will remain steady until the jacking load is released.

603.7.5.5 Control of Jacking Force: Pressure bypass valves may be used for stopping the jack at the required load or for manually stopping the load with the valve. The accuracy of setting of automatic cutoff valves shall be verified by running to the desired cutoff load whenever there is reason to suspect improper results, and at a minimum, at the beginning of the operation each day.

603.7.5.6 Wire Failure in Strands: Failure of wires in a pretensioning strand is acceptable provided the total area of wire failure is not more than 2 % of the total area of strands in a member, and providing the breakage is not symptomatic of a more extensive distress condition. Failure of any individual wire prior to placing concrete will require replacement of the strand.

603.7.5.7 Calibration Records For Jacking Equipment: All jacking and load measuring equipment shall be calibrated as specified in Section [603.3.3](#). Calibration records should show the following data.

1. Date of calibration.
2. Agency, laboratory or registered Professional Engineer (PE) supervising the calibration.
3. Method of calibration; i.e. proving ring, load cell, testing machine, etc., and its calibration reference.
4. The full range of calibration with gauge readings indicated against actual load.

Calibration records for all tensioning systems being used shall be available for preparing theoretical tensioning values. Personnel involved in preparing tensioning calculations shall have a copy of these records for reference.

603.7.6 Pretensioning and Strand Debonding: Pretensioning shall conform to the provisions set forth in Article 2.2, "Pretensioning" of the latest edition of the PCI Quality Control Manual MNL - 116.

Plastic sheathing shall be used for strand debonding and shall be approved by the Engineer prior to use. Items such as animal fat, reactive greases, or PVC pipes shall not be used. Any other material shall be approved by the Engineer prior to use.

603.7.7 Detensioning: Detensioning shall conform to the provisions set forth in Article 2.3, "Detensioning" of the latest edition of the PCI Quality Control Manual MNL - 116.

603.7.8

603.7.8 Concrete Cover: Minimum concrete cover for prestressing steel shall be 1 ½ inches (40 mm) unless otherwise shown on the plans.

603.8 CURING

603.8.1 General: Careful attention shall be given to the proper curing of concrete. Prior to placing of concrete, the contractor shall submit the proposed curing methods and procedures to the Engineer for approval. Elevated temperature curing facilities shall be tested prior to approval. Approved equipment and materials for curing shall be available for use prior to casting.

Inadequate curing facilities or lack of attention to the proper curing of concrete shall be sufficient cause for the Engineer to stop all concrete placement until approved curing is provided. Inadequate curing may be cause for rejection of the member. All test cylinders shall be cured in the same environment as the precast/prestressed concrete members.

Curing shall be commenced prior to the formation of surface shrinkage cracks. The curing mats, sheets, or blankets shall be carefully placed in contact with the concrete member to avoid damage to the freshly finished concrete.

The following curing requirements shall apply for precast/prestressed members. Any other special method of curing shall meet with the approval of the Engineer. Concrete shall not be exposed to temperatures below freezing until the specified minimum strength as shown in plan notes has been attained.

All concrete shall be cured by water curing, accelerated temperature curing, or any other method approved by the Engineer.

603.8.2 Water Curing: All exposed surfaces of the concrete shall be kept wet continuously for the required curing time. The water used for curing shall meet the requirements of 603.2. Water curing shall be permitted as follows:

603.8.2.1 Wet Mat Method: For water curing by the mat method, cotton mats, polyethylene sheeting, or polyethylene burlap blankets may be used. The mats, sheets or blankets shall be adequately anchored and weighted to provide continuous contact with all concrete surfaces. Any concrete surfaces which can not be cured by contact shall be enclosed by mats, adequately anchored, so that outside air cannot enter the enclosure. Sufficient moisture shall be provided inside the enclosure to keep all of the surfaces of the concrete wet for the required curing time, but in no case less than 36 hours.

603.8.2.2 Saturated Cover Curing: The member, covered as specified for the initial phase of curing, shall be maintained on the casting bed in an approved enclosure designed and equipped to insure complete saturation of the covering. The temperature within the enclosure and that of the covering material shall be maintained to provide a uniform curing temperature at the surface of the member, within the limits of 80 °F to 130 °F (27° C) to (54° C), until the specified strength is attained, but in no case less than 36 hours. The

covering shall be kept thoroughly saturated throughout the entire curing period and the temperature of the water used shall be controlled uniformly to maintain the selected curing temperature of the surface of the member.

603.8.2.3 Water Spray Curing: The member, covered as specified for the initial phase of curing, shall be maintained in the casting bed in an approved enclosure. When the concrete is sufficiently hardened to resist damage, the covering shall be removed and the exposed surfaces of the unit shall be subjected to a continuous fine spray of water. The temperature within the enclosure and that of the water used shall be controlled to provide a uniform curing temperature at the surface of the member, within the limits of 80 °F and 130 °F (27° C) to (54° C) until the specified member strength is attained, but in no case less than 36 hours.

603.8.3 Accelerated Curing: Accelerated curing of the concrete shall be done by low pressure steam curing, or radiant heat curing. Transfer of stress shall be accomplished immediately after the heat curing has been discontinued. Accelerated curing shall be applied at a controlled rate following initial set of the concrete as per ASTM C403. Accelerated curing shall be done under suitable enclosures which minimize all heat losses and maintain uniform cure conditions within the enclosed area. Members must be maintained wet during accelerated curing time.

If accelerated curing is used, the contractor/fabricator shall furnish recording thermometers showing the time-temperature relationship of the concrete throughout the entire curing period. Recording thermometers shall be kept in proper calibration and recalibrated at least annually.

603.8.3.1 Low-Pressure Steam Curing: Low-pressure steam curing shall be done under a suitable enclosure to contain the live steam and minimize moisture and heat losses. The concrete shall be allowed to attain its initial set before application of the live steam.

Application of live steam shall not be directed on the concrete or forms such as to cause localized high temperatures. During the initial application of live steam, the concrete temperature shall be raised at an average rate not exceeding 80 °F(27° C)/per hour, until the curing temperature is reached. The maximum sustained concrete temperature during the curing cycle shall not exceed 160° F (70° C). The maximum temperature shall be held until the concrete has reached the required release strength. The maximum peak concrete temperature during the curing cycle shall be 190°F (88° C). The concrete temperature shall be maintained uniformly throughout the extremities of the prestressed member. At the end of curing, the concrete temperature shall be reduced at an average rate not exceeding 50° F (10° C)/per hour.

603.8.3.2 Radiant Heat Curing: Radiant heat may be applied by means of pipes circulating steam, hot oil or hot water, or by electric heating elements. Radiant heat curing shall be done under a suitable enclosure to

603.9

contain the heat, and moisture loss shall be minimized by covering all exposed concrete surfaces with a plastic sheeting or by applying an approved liquid membrane curing compound to all exposed concrete surfaces. The heat application shall be maintained to create a uniform concrete temperature throughout the extremities of the member.

After the waiting period prior to application of the heat, the concrete temperature shall increase at an average rate not exceeding 80° F (27° C)/per hour until the curing temperature is reached. The maximum sustained concrete temperature within the curing cycle shall not exceed 160° F (70° C). The maximum temperature shall be held until the concrete has reached the required release strength as shown in plan notes. The maximum peak concrete temperature during the curing cycle shall be 190° F (88° C). The maximum cooling rate from sustained concrete curing temperature shall be 50° F (10° C)/per hour.

603.9 - FINISHING

To assure the production of well formed matching members, all surfaces of the concrete shall be finished, shall be true and even, and shall be free from rough, open, or honeycombed areas, depressions or projections. The edges shall be finished or chamfered, or both. Care shall be exercised in removing forms to avoid spalling or otherwise damaging the concrete.

Top surfaces of prestressed members shall be screeded or rough floated to bring mortar to the surface and cover all aggregate. The surface of members which will receive cast-in-place concrete on the project site shall have a rough wood float or stiff broom finish. Aggregate shall not be loosened when roughening the surface. The fascia surfaces of bridge members shall be finished with a "Class 2, rubbed finish" conforming to Section 601.11.2. Concrete on exposed reinforcing steel and loose laitance on concrete surfaces to be in contact with cast-in-place concrete shall be removed from all members.

Fabrication holes, except box beam vent holes, in the bottom of all beams, shall be filled with nonshrink mortar and made flush with the surrounding surface. Care shall be taken in final cutting ends of strands to avoid damaging the concrete surface.

603.10 WORKMANSHIP

603.10.1 General: Holes and voids in the surface of concrete resulting from bolts, ties, or large air pockets shall be wetted and filled with mortar having the same proportion of fine aggregate and cement as in the concrete, after which exposed mortar surfaces shall be finished smooth and even with a wood float.

Surfaces to be repaired and finished shall be kept wet for at least one hour before hydraulic cement mortar is applied. Immediately following patching work, repaired areas shall be wet cured for at least 48 hours. The wet cure may be accomplished by the use of steam, wet burlap or continuous spray wetting. A liquid membrane-curing compound may be used on non-composite

surfaces.

Beams or girders having honeycomb of such extent to affect their strength or resistance to deterioration will not be accepted.

603.10.2 Defects and Breakage:

Defective or damaged members which cannot be satisfactorily repaired, or which are not acceptable to the Engineer will not be incorporated into the work. All other members that sustain damage during fabrication, handling, storage or transportation shall be evaluated in accordance with Chapter three of PCI Journal Vol. 30, # 3 entitled "Fabrication and Shipment Cracks in Precast or Prestressed Beams and Columns", hereinafter referred to as "specification". This specification is to be used to determine the severity of cracks. All cracks with a width of 4 mils (0.1 mm) or less may be repaired by silane treatment if the repair section of the specification allows repairs. All cracks over 4 mils (0.1 mm) to and including 16 mils (0.4 mm) shall be repaired by epoxy injection if allowed by the specification. Members with cracks over 16 mils (0.4 mm) shall not be incorporated into the work unless approved by the Engineer.

603.11 DIMENSIONAL TOLERANCES

All tolerances shall be applied with respect to the theoretical positions and dimensions shown in the plans. The tolerances listed in this article represent the total allowable tolerance that will be accepted in the finished product.

The limits of tolerance do not necessarily represent fully acceptable construction; they are the limits at which construction becomes unacceptable. In general, workmanship shall be at a level of quality that will be well within the tolerance limits.

603.11.1 Prestressed Concrete I-Beams and Bulb Tee Beams:

Characteristics	Value
Depth (flanges)	$\pm 1/4$ in. (± 6 mm)
Depth (Overall)	$+1/2$ in., to $-1/4$ in. (+15 to -6 mm)
Width (flanges)	$+3/8$., to $-1/4$ in. (+10 to -6 mm)
Width (Web)	$+3/8$., to $-1/4$ in. (+10 to -6 mm)
Length of Beam	$\pm 1/8$ in. per 10 ft., ± 1 in. max. (± 1 mm/m, 25 mm max)
Sweep (variation from straight line parallel to centerline of member)	$\pm 1/8$ in. per 10 ft (± 1 mm/m)
Camber variation from design camber	$\pm 1/8$ in. per 10 ft. $\pm 1/2$ in. max up to 80 ft. length ± 1 in. max. over 80 ft. length (± 1 mm/m) (± 13 mm max. up to 24 m length) (± 25 mm max. over 24 m length)
Camber variation from design camber	$\pm 3/16$ in. per 12 in. ± 1 in. (± 15 mm/m, ± 5 mm max)
Position of plates	± 1 in. (± 25 mm)
Position of bearing plates	$\pm 5/8$ in. (± 16 mm)
Diaphragm Inserts (spacing between centers of inserts and from centers of inserts to the ends of the beams.)	$\pm 1/2$ in (± 15 mm)
Stirrup bars (Projection above top of beam)	$\pm 3/4$ in. (± 20 mm)
Stirrup bars (Longitudinal spacing)	± 2 in. (± 50 mm)
Concrete Cover	$\pm 1/4$ in (± 6 mm)
Position of inserts for structural connections	$\pm 1/2$ in (± 15 mm)
Position of hold-down points for draped strands	± 5 in. (± 125 mm)
Position of Inserts	$\pm 1/2$ in (± 15 mm)
Position of handling devices: Parallel to length Transverse to length	± 6 in. (± 150 mm) ± 1 in (± 25 mm)
Prestressing strand position (vertical or horizontal).	$\pm 1/4$ in. (± 6 mm)

603.11.2 Precast / Prestressed Concrete Box Beams and Plank Beams:

<i>Characteristics</i>	<i>Value</i>
Depth (Overall)	±1/4 in. (± 6 mm)
Depth (top flange)	+1/2 in (+15 mm)
Depth (bottom flange)	+1/2 in., to -1/8 in (+15 to 3 mm)
Width (Overall)	±1/4 in. (±6 mm)
Width (Web)	±3/8 in. (±6 mm)
Length	± 3/4 in. (± 20 mm)
Sweep (variation from straight line parallel to centerline of member) Up to 40 ft. (12 m) length member	±1/4 in. (± 6 mm)
40 to 60 ft. (12 to 18 m) length member	±3/8 in. (±10 mm)
Greater than 60 ft.(18 m) length member	± 1/2 in (± 15 mm)
Camber variation from design camber	±1/8 in. per 10 ft., ±1/2 in. Max. (±1 mm/m, ±15 mm Max)
Variation from specified end Squareness of skew:	± 5/8 in. (± 16 mm)
Horizontal	±1/8 in. per 12 in. , ±½ in. Max. (±1 mm/100 mm, ±15 mm Max)
Vertical	1/2 in (± 15 mm)
Position of tendons Individual	± 1/4 in (± 6 mm)
Position of Inserts for structural connections	± 1/2 in (± 15 mm)
Position of handling devices:	
Parallel to length	± 6 in. (± 150 mm)
Transverse to length	± 1 in (± 25 mm)
Position of stirrups:	
Longitudinal spacing	± 1 in. (± 25 mm)
Projection above top	+ 1/4 in (± 6 mm), - 3/4 in. (- 20 mm)
Position of dowels tubes	± 5/8 in. (± 16 mm)
Position of hold-down points for draped strands	± 5 in. (± 125 mm)
Position of tie rods tubes:	
Parallel to length	± 1/2 in (± 15 mm)
Vertical	±3/8 in. (±10 mm)
Position of slab void:	
End of void to center of tie hole	± 1/2 in (± 15 mm)
Adjacent to end block	± 1 in (± 25 mm)
Concrete Cover	± 1/4 in. (± 6 mm) ¼ in. per 10 ft. long. Bars (6 mm per 3 m)

603.11.3**603.11.3 Prestressed Concrete Deck Panels:**

<i>Characteristics</i>	<i>Value</i>
Length	± 1/2 in (± 15 mm)
Width	± 1/2 in (± 15 mm)
Nominal Depth	+ 1/4 in., - 1/8 in (+6 mm, -3 mm)
Horizontal Alignment – Deviation from straightness of matting edge of panels	1/8 in (3 mm)
Deviation of ends from plan dimension Horizontal Alignment	± 1/2 in (± 15 mm)
Position of strands :	
Vertical	±1/8 (±3 mm) ± 1/2 in (± 15 mm)
Horizontal	
Concrete Cover	± 1/4 in. (± 6 mm) ¼ in. per 10 ft. long. Bars (6 mm per 3 m)

603.12 HANDLING, STORING, TRANSPORTING, AND ERECTION

The Contractor shall be responsible for proper handling, lifting, storing, hauling, and erection of all members so that they are placed in the structure without damage.

Prestressed members shall be maintained in an upright position at all times and shall be handled and supported in a manner which prevents torsion. No member shall be moved from the casting yard until the member has been accepted.

Storing of members shall be done with adequate blocking so that warpage or cracking will not occur. Blocking will be such that at least 6 inches (150 mm) clearance is maintained above the surface on which the blocking is placed. Placement of the blocking from beam ends shall be at locations not greater than (3) percent of the beam length. Concrete box beams shall be supported by the solid end block area during handling, storage, hauling, and erection. Members which are improperly stored and which become cracked, warped, or otherwise damaged in storage will be subject to rejection.

Members when stacked, shall be separated by blocking capable of supporting the members. The blocking shall be arranged in vertical planes. Stacking of members shall be arranged such that lifting devices will be accessible and undamaged. Stacking shall not exceed two members high.

All concrete beams or girders when erected, shall be securely tied and/or braced unless otherwise shown on the plans. When railroad or roadway traffic must be maintained beneath girders or beams already placed, traffic shall be protected against falling objects during the erection of diaphragms and other

structural members, during the placing of cast-in-place concrete, and during the erection and dismantling of forms. Protection shall consist of nets or flooring with openings not larger than 1 inch (25 mm).

When precast / prestressed concrete adjacent box beams are erected, the fit of mating surfaces will be such that excessive grout leakage will not occur. If such fit is not provided the joint shall be filled with grout or sealed with an acceptable caulking suitable to the Engineer.

603.13 CONSTRUCTION OF DECK

The variation in heights between beams shall not be more than 1/2 in (13 mm) between adjacent box beams where there is no wearing surface. For adjacent box beam bridges with wearing surfaces, the differential shall not exceed 3/4 inches (19 mm).

Dowel bar and lifting bolt holes shall be filled with non-shrink grout. Adjacent box beam units shall be transverse post tensioned by the use of high strength threaded bars, or by other methods as shown on the Plans.

603.14 MEASUREMENT AND PAYMENT

603.14.1 Method of Measurement: Precast/Prestressed concrete structural members will be measured along the member centerline in linear feet (meter). Deck panels shall be measured by area in square feet (meter) complete in place.

Precast reinforced concrete three-sided structures shall be measured along the centerline of the erected structure in linear feet (meter).

Precast reinforced concrete headwalls and wingwalls for use with precast reinforced concrete three-sided structures shall be measured in square feet (meter) as measured on the exterior face of the member.

603.14.2 Basis of Payment: Precast / Prestressed concrete beams, deck panels, precast reinforced concrete three-sided structures, and precast reinforced concrete headwalls and wingwalls will be paid for at the contract unit price bid for the items listed below, which price and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner including the cost of furnishing and manufacturing the concrete members; for labor, concrete, forms, conventional reinforcing steel, prestressing strands, inserts, anchorage devices, bearing pads, shims, grout, wingwalls and headwall connection hardware, joint sealing/waterproofing, and other devices, and for moving, transporting and erecting the finished product in accordance with the Plans and Specifications. For precast reinforced concrete three-sided structures where the headwall is cast integral with the end structure unit, the headwall will be paid for in square feet (meter) as if it were not integral cast. Cast-in-place concrete diaphragms, curb, parapet, railing, and reinforcing steel for cast-in-place concrete are not included in this item.

SECTION 604

PIPE CULVERTS

604.1-DESCRIPTION:

This work shall consist of the construction or reconstruction of pipe culverts, referred to as "conduit", in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions, and locations shown on the plans or established by the Engineer.

604.2-MATERIALS:

Materials shall meet the requirement specified in the following Subsections of Division 700:

<u>MATERIAL</u>	<u>SUBSECTION</u>
Metallic Coated Corrugated Steel Pipe or Pipe Arch.....	713.2
Corrugated Stainless Steel Pipe.....	713.7
Bituminous Coated Corrugated Steel Pipe or Pipe Arch.....	713.3
Precoated, Metallic Coated steel Pipe.....	713.23
Bituminous Coated and Paved Invert Corrugated Steel Pipe or Pipe arch.....	713.3
Precoated and Paved Invert Metallic Coated Steel Pipe or Pipe Arch.....	713.23
Full Bituminous Coated and Full Paved Corrugated Steel Pipe.....	713.4
Precoated and Full Paved Metallic Coated Steel Pipe.....	713.23
Fiber Bonded Full Bituminous Coated Corrugated Steel Pipe	713.5
Fiber Bonded Full Bituminous Coated and Paved Invert	

	604.2
Corrugated Steel Pipe.....	713.5

Clay Pipe, Extra Strength.....	714.10
Bituminized Fiber Pipe (non-perforated).....	714.14
Corrugated Polyethylene (PE) Pipe.....	714.19
Acrylonitrile-Butadiene-styrene (ABS) Pipe.....	714.21
Polyvinyl Chloride (PVC) Pipe.....	714.22
Reinforced Plastic Mortar (RPMP) Pipe.....	714.17
Fiberglass Reinforced (FRP) Pipe.....	714.16
Asphalt Cement for Field Paving Structural Plate Pipe	
and Pipe Arches.....	705.5, Grade 40-50
Vitrified Clay Pipe Joints.....	708.5
Hot Pour Mineral Filled Joint Sealer.....	708.6
Flexible Watertight Gaskets for Circular Concrete Pipe.....	708.7
Joint Mortar.....	708.8
Bituminous Plastic Cement.....	708.9

604.2.1

Granular Material for Culvert Bedding..... 716.1.1.2
Controlled Low Strength Material.....219
Crushed Aggregate Backfill.....704.6, Class I
Aluminum Coated Corrugated Steel Pipe and Pipe Arch..... 713.24
Precast Reinforced Concrete Box Culverts714.23
Safety Slope End Sections.....713.20
Fine Aggregate.....*

*Fine Aggregate shall consist of crushed or uncrushed mineral aggregate which has 100 percent passing the 3/8 in. (9.5 mm) sieve.

When the locations of manufacturing plants allow, the plants may be inspected periodically for compliance with specified manufacturing methods, and material samples may be obtained for laboratory testing for compliance with material quality requirements. This may be the basis for quality acceptance of manufactured lots.

All materials will be subject to inspection for acceptance as to condition at the latest practicable time the Engineer has the opportunity to check for compliance prior to or during incorporation of materials in the work.

All references to "corrugated steel pipe" are considered applicable to uncoated pipe and the various combinations of coated pipes (bituminous coated, fiber bonded, precoated, etc.) and paving classes (paved invert, full paved, etc.) for which the base metal conforms to AASHTO M 218 or AASHTO M 274.

The sheet thickness for corrugated steel pipe and corrugated aluminum alloy pipe shall be as designated on the Plans.

Corrugated metal pipe of 2-2/3 by 1/2 inches (68 mm by 13 mm) corrugation shall be furnished unless otherwise specified.

Corrugated steel pipe and pipe arch with 2-2/3" x 1/2", 3" x 1", and 5" x 1" (68 mm by 13 mm, 75 x 25 mm and 125mm x 25mm) corrugations shall be helically fabricated, except for fiber bonded pipe which may be fabricated with annular corrugated of 2-2/3" x 1/2" and 3" x 1" (68 mm x 13 mm and 75 mm x 25 mm). Corrugated aluminum alloy pipe with 2-2/3" x 1/2", 3" x 1", and 6" x 1" (68 mm x 13 mm, 75 mm x 25 mm, 75 mm x 25 mm, and 150 mm x 25 mm) corrugations and corrugated aluminum alloy pipe arch with 2-2/3" x 1/2" (68 mm x 13 mm) corrugations shall be helically fabricated. Where 5" x 1" (125 mm x 25 mm) corrugations are specified for corrugated steel pipe and pipe arch, 3" x 1" (75 mm x 25) corrugations may be substituted.

604.2.1-QUALITY CONTROL TESTING:

Quality control of the fine aggregate, granular material and crushed aggregate backfill is the responsibility of the Contractor as specified in 106.1.

Acceptance for gradation will be on the basis of the Contractor's written certification that all such material used for this conforms to the specified requirements. The certification is to include the results of testing from samples obtained at a minimum frequency of one sample per one-half day of aggregate production or stockpiling.

CONSTRUCTION METHODS

604.3-GENERAL:

Subject to the provisions prescribed, the flow line of a conduit may be altered from that shown on the plans. If a firm conduit foundation is not encountered at the specified elevation, the unsatisfactory material shall be replaced with suitable material to a depth directed by the Engineer.

Galvanized steel pipe or bands shall not come in contact with aluminized steel pipe or bands.

The diameter of conduit, as used in this Section, is the largest dimension, horizontal or vertical.

604.4-TRENCH EXCAVATION:

604.4.1-Conduits 18 Inches (450 mm) Through 54 Inches (1400 mm):

In complete or partial fill sections, before trenching is begun, the fill shall be constructed for a minimum distance of six diameters on each side of the conduit and to a height of 2 feet (600 mm) over the top of the conduit or to the surface of the completed embankment if less than 2 feet (600 mm) above the top of the conduit. The width of the trench, in either cut or fill sections, shall not be less than the outside diameter of the conduit or encasement plus 18 inches (450 mm) on each side of the conduit measured to the face of the trench or to the sheeting when used.

604.4.2-Conduits 60 Inches (1500 mm) Through 108 Inches (2700 mm):

In complete or partial fill sections, before trenching is begun, the fill shall be constructed for a distance of six diameters on each side of the conduit and to a minimum height of 25 percent of the vertical dimension of the conduit. The width of the trench shall not be less than the outside horizontal diameter of the conduit plus one diameter on each side of the conduit. When using a Controlled low strength material the width of the trench shall not be less than the outside horizontal diameter of the conduit plus one half diameter on each side of the conduit.

In rock or shale cut section, the width of the trench shall not be greater than required to obtain the backfill compaction specified. Soil cut trenches shall be treated as complete or partial fill sections. For rigid pipe, the width of the trench shall not be less than the outside horizontal diameter of the conduit plus 24 inches (600 mm) on each side of the conduit.

604.4.3-Conduit Greater Than 108 Inches (2700 mm): In complete or partial fill sections, before trenching is begun, the fill shall be constructed for a distance of six diameters on each side of the conduit and to a minimum height of 25 percent of the vertical dimension of the conduit.

Installation of the conduit shall be as detailed in the plans, including the type and amount of backfill and bedding.

For flexible conduit, the Contractor shall submit shop drawings detailing all erection procedures including anticipated movements during backfilling

604.4.4

operations. Backfill operations shall also be detailed to show lift thicknesses, sequence of lifts and shape of the conduit during these operations.

The Contractor shall submit a plan of field control for the installation insuring the conduit is erected in accordance with the shop and erection drawings.

604.4.4-Structural Plate Arches: Excavation for the foundations of structural plate arches shall be as for box culverts and structures and in accordance with [212.3](#).

604.5-BEDDING

604.5.1-General: The conduit bedding shall conform to one of the classes described below as specified. When no bedding class is specified, the requirements for Class B bedding shall apply.

When a firm foundation is not found at grade due to the presence of foreign material or trash, or due to the presence of moisture eight percent in excess of optimum, the unsatisfactory material shall be removed for the width of the conduit plus 18 inches (450 mm) on each side and replaced with granular material.

604.5.2-Class A Bedding: Class A bedding shall consist of a continuous concrete cradle conforming to the plan details.

604.5.3-Class B Bedding: Class B bedding shall consist of bedding the conduit in an earth foundation of uniform density, carefully shaped by means of a template to fit the lower conduit exterior for at least 15 percent of the overall height of the conduit. Exception is made in the case of structural plate pipe where the length of the bedding arc need not exceed the width of the bottom plate. However, if the structural plate pipe is first assembled and then placed in the trench, the 15 percent embedment specified above shall apply. Recesses shall be made in the trench bottom to accommodate the bell when bell and spigot type conduit is used. Fine aggregate shall be used to level the foundation. When rock is encountered, it shall be removed and replaced with specified material having a thickness under the conduit of 2 in. per ft. (40 mm per m) height of fill over the top of the conduit, with a minimum thickness of 12 inches (300 mm) and a maximum thickness of 24 inches (600 mm).

604.5.4-Class C Bedding: Class C bedding shall be in accordance with the details shown on the Plans. Recesses shall be made in the trench bottom to accommodate the bell when bell and spigot type conduit is used.

604.6-LAYING AND JOINING:

604.6.1-Rigid and Flexible Conduits: The conduit placing, unless the Contractor is otherwise directed, shall begin at the downstream end of the conduit. The lower segment of the conduit shall be in contact with the shaped bedding throughout its full length. Bell or groove ends of rigid conduits and

outside circumferential laps of corrugated steel pipe and corrugated aluminum alloy pipe conduits shall be placed facing upstream.

Paved or partially lined conduit shall be laid so that the longitudinal centerline of the paved segment coincides with the flow line.

Rigid conduits may be of either bell and spigot or tongue and groove design, unless one type is specified. The method of joining conduit sections shall be such that the ends are fully entered and the inner surfaces are reasonably flush and even.

Joints for rigid conduits shall be made with (1) portland cement mortar or grout, (2) flexible watertight gaskets, (3) bituminous plastic cement, (4) oakum and mortar, (5) oakum and joint compound, (6) vitrified clay pipe joints, (7) hot pour mineral filler joint sealer, or by a combination of these types.

When mortar joints are used for tongue and groove and bell and spigot conduit, they shall be made by plastering up to the quarter point the joint mortar before the succeeding joint is placed. Thickness of mortar shall be sufficient to maintain proper invert grade. The accessible outer joint shall then be filled with an excess of mortar to form a bead around the outside of the conduit and finished smooth on the inside. For grouted joints, molds or runners shall be used to retain the poured grout. When portland cement mixtures are used, the completed joints shall be protected against rapid drying by suitable covering material. Where oakum is used, the joint shall be caulked with oakum and then sealed with the joint compound. When rubber or plastic gaskets are used, they shall be installed to form a flexible watertight seal.

Flexible conduits shall be joined by couplings in accordance with manufacturers recommendations, and the pipe shall be fastened to preserve the alignment and prevent the separation of sections.

Conduit shall be inspected before any backfill is placed. Any pipe found to be out of alignment, unduly settled, or damaged shall be removed and relaid or replaced.

604.6.2-Structural Plate Pipe and Pipe Arches: The bottom plates of structural plate pipe and pipe arches shall be assembled in a line, placing each section in the order recommended by the manufacturer. Side and top plates shall then be placed in the order recommended by the manufacturer. Bolts shall be placed in the location and number as recommended by the manufacturer. Plates shall lap each other the width of one corrugation, and bolts shall be inserted and nuts hand tightened as each plate is placed. Drift pins may be used to facilitate matching holes. When all the plates are in position and all bolts placed, all bolts shall be gone over a second time to insure proper tightening. Steel bolts shall be torqued during installation to a minimum of 100 ft. - lbs. (135 newton meters), and a maximum of 300 ft. - lbs. (400 newton meters) Aluminum bolts shall be torqued during installation to a minimum of 100 ft. - lbs. (135 newton meters), and a maximum of 150 ft. - lbs. (200 newton meters) For power driven tools, the hold-on period may vary from 2 to 5 seconds. Bolts shall be of sufficient length to provide for a full nut. When the structure is bituminous coated, all bolts and nuts shall be coated inside and outside of the

structure, after completion of bolt tightening, with bituminous material conforming to the requirements of [713.3](#).

604.6.3-Structural Plate Arches: Plate arches shall be set on footings as shown on the Plans. Beginning at the upstream end, the first side plates shall be set on the base angles. Then the remaining side plates and the top plates of the arch shall be bolted into place using only enough bolts to hold them without tightening securely. Drift pins may be used to assist in matching bolt holes. Temporary props may be used to hold plates in place until connections are made. After the plates comprising the first arch have been assembled, the next set shall be placed in the same manner, finishing each set of side plates with a top plate before placing in the same manner, finishing each set of side plates with a top plate before placing the next set of side plates. New plates shall be lapped one corrugation on the outside of the preceding plates. When all the plates are in position, the remaining bolts shall be inserted and all nuts firmly tightened. Steel bolts shall be torqued during installation to a minimum of 100 ft. - lbs. (135 newton meters), and a maximum of 300 ft. - lbs. (400 newton meters) Aluminum bolts shall be torqued during installation to a minimum of 100 ft. - lbs. (135 newton meters), and a maximum of 150 ft. - lbs. (200 newton meters) For power driven tools, the hold-on period may vary from 2 to 5 seconds. Bolts shall be of sufficient length to provide for a full nut. When the structure is bituminous coated, all bolts and nuts shall be coated inside and outside of the structure, after completion of bolt tightening, with bituminous material conforming to the requirements of [713.3](#).

604.7-ELONGATION:

When specified on the plans, factory elongation of flexible pipe shall be not less than four percent and not more than six percent vertically. Elongation shall be maintained during shipping, storing and handling.

604.8-BACKFILLING:

Backfill material shall be suitable random material free from particles larger than 3 inches (75 mm), crushed aggregate backfill, or controlled low strength material. After the conduit is installed, random material and crushed aggregate backfill shall be placed along the conduit in layers not to exceed 4 inches (100 mm) compacted. Controlled low strength material shall be placed according to Section [219](#). Any of the types of controlled low strength material may be used. For flexible conduit 60 inches (1 500 mm) through 108 inches (2 700 mm), the backfill material shall be crushed aggregate backfill or controlled low strength material. Unless otherwise specified in the plans, the controlled low strength material can be used as a substitute for random material or crushed aggregate backfill at the contractor's option.

The quality control testing and acceptance of controlled low strength material shall be according to [219](#).

The quality control testing and acceptance for compaction of the random

backfill material shall be in accordance with applicable sections of 207 and 716 and crushed aggregate backfill according to 717, with the following exception:

Testing will be conducted on both sides of the conduit and testing within a lot may include tests on both sides of the conduit. For conduit installations in an embankment where existing tests are on file for the adjacent embankment material, the target percentage of dry density for the conduit backfill will be equal to the average of the X values for the tests in the adjacent lots of embankment material or a minimum value of 95, whichever is greater. For embankments where no tests are on file, the target percentage of dry density will be 95. A lot shall have five (5) density tests performed for quality control.

For conduits less than 60 inches (1500 mm) in diameter, a lot will normally consist of the quantity of backfill required for each 75 linear feet (23 m) of conduit installed.

For conduits 60 inches (1500 mm) in diameter and larger, a lot will normally consist of not more than 5 lifts of backfill. For conduit with lifts of backfill placed for the full length of the conduit, a subplot will normally consist of a lift of backfill placed on both sides for the full length of the conduit. For conduits that are backfilled in segments, a subplot will normally consist of a lift of backfill placed on both sides for the length of each segment of conduit backfilled.

Backfill placed outside embankments and roadbed is to be compacted to or better than the average total dry density for the existing soil. An average total dry density will be determined from representative density tests conducted for each existing soil. Quality control testing will normally consist of one test per 100 linear feet (30 m) of conduit installed and lot evaluations are not required. The moisture tolerance is not applicable.

The use of a bulldozer or other bladed equipment in placing backfill is expressly forbidden. Mechanical equipment with various type buckets may be used. Care shall be taken to compact the material under the haunches of the conduit, to place the backfill evenly on each side of the conduit to retain its vertical axis, and to avoid displacement. This method of backfilling and compacting shall be followed until the top of the trench is reached. In the case of conduit 60 inches (1500 mm) through 108 inches (2700 mm) in diameter, not in trench condition, this backfilling and compacting shall be carried to a height of 2 feet (600 mm) over the top of the conduit and to a width not less than the outside diameter of the conduit plus one diameter on each side. Above this elevation, the embankment shall be placed and compacted in the normal manner. All conduit, after being bedded and backfilled, shall be protected by a four foot (1200 mm) cover of fill, or more if necessary, before heavy equipment is permitted to cross during the construction of the roadway. The Contractor will be held responsible for any damage to the conduit resulting from movement of equipment over the structure.

604.9-FIELD PAVING:

When field paving is required for structural plate pipe and pipe arches, the following provisions shall govern:

The surface to be field paved shall be thoroughly cleaned and dried, and the priming material shall be sufficiently applied with a brush or a mop to coat the surface and to fill all seams or joints. After the priming material has been applied, a wire mesh, having not less than Size # W 1.4 wire and having openings not more than 4 inches (100 mm) by 6 inches (150 mm), shall be placed on top of the corrugations and securely fastened to the bolts with wire or suitable clips.

The reinforcing mesh shall have a width 1 ft. (300 mm) less than the width of the finished paving and shall be fastened to the structure near each edge and at the center of the mesh at points not more than 2 feet (600 mm) apart along the longitudinal barrel of the structure. The paving material shall consist of five parts of clean fine sand, three parts of cement or other fine filler such as limestone dust or lime, and approximately two parts of asphalt cement. The quantity of asphalt may be adjusted to provide a plastic workable mix. Before mixing, the mortar sand shall be dried by heating to approximately 300° F (150° C). After drying, the sand shall be mixed with the fine filler in a steel mortar box or other suitable equipment and heated to 300° F (150° C). The asphalt shall be heated in a separate container to a temperature of 400° F (200° C) and then thoroughly mixed with the sand and filler until a workable mix is obtained. All lumps shall be removed by mixing with a mortar hoe or other suitable implement. The mixture shall be kept hot and shall be applied to the primed surface before cooling. The mixture shall be applied in such a manner that smooth pavement will be formed in the invert, filling the corrugations for at least 25 percent of the circumference of a pipe or 38 percent of the circumference of a pipe arch. The paving thickness shall be sufficient to cover the crests of the corrugations a minimum of 1 in. (25 mm). The placing of the mastic shall be followed closely by the application of a seal coat and hot asphalt cement to be poured uniformly over the paving. The seal coat shall be applied while the paving material is still hot.

The Contractor may pave with portland cement concrete or use shotcrete. If practicable, such paving shall be delayed until completion of the fill over the structure. Before the placing of the paving, the surface of the plates shall be cleaned to the plates or to the asphalt coating if asphalt coated plates are used. When paving with portland cement concrete or shotcrete, mesh reinforcement, fastening of mesh, and paving dimensions shall be as specified for bituminous paving except that the minimum thickness over the crest of the corrugations shall be 1-½ inches (40 mm).

Concrete used shall have a design 28-day compressive strength of 3,000 psi (21 MPa) (equivalent to Class B in 601.3); concrete may be hand mixed and shall be handled and placed as directed by the Engineer. After initial set has taken place, the paving shall be flooded or kept moist by sprinkling for three days. Liquid membrane-forming compound, conforming to 707.9 may be used for curing at a minimum application rate of one gallon per 150 sq. ft. (0.25

liters per m²) of concrete surface. Other methods of curing may be used if approved by the Engineer.

Field paving with shotcrete shall conform to the applicable provisions of 623. When paving with shotcrete, the exposed surface shall be brought to a uniform surface by screeding or troweling. After completion of the shotcrete paving, the rebound material shall be cleaned from the culvert above the paved surface. Shotcrete shall be cured by (a) covering with burlap mats and keeping them wet for at least seven days after placing, (b) flooding for a period of at least seven days or, (c) applying liquid membrane curing compound, conforming to 707.9, at a minimum rate of one gallon per 150 per ft. (0.25 liters per m²) of shotcrete surface for each application. Shotcrete cured by membrane forming compound shall receive two applications; the second application shall be made after the first application has set. Other methods of curing may be used if approved by the Engineer.

After the completion of the fill over the pipe or pipe arch, any gaps which develop between the plates and the concrete or shotcrete paving shall be filled by pouring heated bituminous material complying with requirements of 713.3.

When field paving is specified for metal pipes and metal pipe arches, the methods and materials used shall be the same as specified except that the wire mesh shall be tied to the corrugated metal at points not exceeding 30 inches (750 mm) in any direction and not exceeding 9 inches (225 mm) from the edges of paving. Attachment may be by use of ½" diameter (12 mm) (minimum) commercially-available galvanized or cadmium-plated lag screws twisted firmly into holes drilled in the valleys of the corrugations or by other approved means.

Prior to using portland cement concrete or shotcrete for paving aluminum alloy culverts or culverts with coatings containing aluminum, the aluminum-concrete contact area shall be coated with commercially-available paint.

604.10-RELAID CONDUIT:

The construction requirements in this Section shall apply equally in the case of relaid conduits. All conduits salvaged for relaying shall be cleaned of all foreign material prior to reinstallation.

604.11-JACKING CONDUIT:

Jacking or tunneling may be designated on the Plans or may be permitted if written approval is obtained. Conduit to be jacked may be either reinforced concrete or corrugated steel, as called for in the Plans. The strength of conduit designated in the Contract will be designated as required for vertical load only.

Additional reinforcement or strength of conduit required to withstand jacking pressure shall be determined and furnished by the Contractor without additional cost to the Division. Variation from theoretical alignment and grade at the time of completion of jacking placement shall not exceed 0.2 ft. for each 20 ft. (10 mm per m) of conduit so placed. Corrugated steel pipe section to be jacked shall be prepared for making field joints either by riveting or bolting. Concrete pipe to be jacked shall be tongue and groove type.

604.11

An approach trench shall be constructed on the side from which jacking operations shall take place. The end of the approach trench away from the jacking face shall be cut perpendicular to the axis of the jacking operation to provide bearing surface for the back stop and the jack blocking. The length of the approach trench shall be such that the distance between the jack blocking and the face of the bore shall be equal to 5 feet (1500 mm) plus the length of the individual pipe sections in the case of corrugated steel pipe. When concrete pipe is jacked, the maximum length of the approach trench shall be equal to two lengths of pipe plus a minimum of 7 feet (2.1 m) for jack and blocking. The jacking face shall be a minimum of 3 feet (1 m) above the top of the pipe; the face shall be cut vertically and shall be shored to prevent raveling and slipping. A sump shall be constructed in one corner of the trench to provide drainage. In the case of corrugated steel pipe, a transverse trench shall be constructed at the jacking face to provide clearance for the riveting and bolting of joints. The back stop shall be constructed of heavy timbers or steel rails capable of withstanding the jacking force.

In the event the site of jacking operations is such that an approach trench cannot be constructed, the jack blocking shall be constructed to carry the reaction of the jack to the ground. This may be accomplished by means of timber, steel, or concrete vertical back stops set into the ground with the tops supported by diagonal members bearing against an embedded anchorage.

Directly opposite the approach trench, an exit trench shall be constructed to line and grade. The exit trench shall be constructed in the same manner as the approach trench except that no back wall is necessary.

Jacks shall be of sufficient capacity to overcome soil resistance to the jacking operation and shall be operated in pairs. As a guide, capacity of jacks for corrugated steel pipe shall be a minimum of 35 tons (32 Mg) each and for concrete pipe a minimum of 50 tons (45 Mg) each. For large pipe, more than one pair of jacks may be required. Small track jacks may be used to start the pipe.

Pipe guides shall be constructed in the approach trench and may be either timber or steel rail or concrete guides on a cradle. Since the pipe guides will support the pipe as it enters the jacking face, the pipe guides shall be accurately set to line and grade, and excavation for the guides shall be made to grade to avoid occurrence of settlement. Guides shall be spaced at $\frac{1}{2}$ the pipediameter inside face to inside face of the guides for corrugated steel pipe and at $\frac{4}{10}$ the outside diameter for concrete pipe.

Reaction of the jack to the pipe shall be transmitted by either a jacking frame or jacking beams constructed of timber or steel. Jacking frames and beams shall be so placed as to exert equal pressure on each side of the pipe. For pipes 36 inches (900 mm) in diameter or smaller, a steel jacking ring may be used in lieu of the jacking frame.

The pressure from the jacking frame or beams may be transmitted to a jacking collar or head on the pipe itself. In the case of corrugated steel pipe, a jacking band reinforcing the end of the pipe receiving the thrust shall be used. Jacking collars or heads for concrete pipe shall be constructed to prevent

damage to the pipe ends. Jacking collars and jacking frames shall be constructed to allow passage of men and material.

Joints of concrete pipe shall be cushioned and protected from infiltration of fine materials occurring during the jacking operation by insertion of a cushioning material into each pipe joint. After the pipe is in position, the joints shall be pointed from the inside with mortar joint compound.

Steel cutting edges on the lead section of pipe may be used, and the use of a jacking shield is permitted.

To prevent the pipe from "freezing" and becoming incapable of movement, jacking operations should, if possible, be carried out on a 24-hour basis. A minimum of two 8-hour shifts shall be worked. Alignment and grade of the pipe guides shall be checked at least once each shift. To aid in the prevention of "freezing," the pipe may be lubricated in a manner and with a material meeting the approval of the Engineer.

Excavation for the bore shall be to grade at the bottom and approximately 1 in. (25 mm) greater than the diameter of the pipe at the top and sides. Initial jacking of concrete pipe shall begin with two sections of pipe in the trench. As excavation proceeds, the jacking shall proceed until the effective limit of the jacking is reached, at which time additional blocking shall be added. This process shall be continued until there is room for an additional pipe section. For long runs of pipe, the use of intermediate jacking stations will be allowed as approved by the Engineer.

Pipe cover shall be a minimum of one diameter or 3 feet (900 mm) from top of pipe to bottom of the subgrade of ballast when jacking under a bituminous concrete highway. When jacking under reinforced concrete pavement, the cover may be reduced to the depth of the base course plus the pavement thickness with a minimum cover of the pavement thickness plus 6 inches (150 mm).

After the pipe has been jacked into place, the backfill shall be tightly compacted around both ends of the culvert to prevent erosion. Any departure from the above specifications necessitated due to site conditions shall be approved in writing by the Engineer.

Areas resulting from caving or excavation outside the above limits shall be backfilled with sand or grout by a method which will fill the voids. Joints shall be completed as specified for the type of conduit being installed.

604.12-METHOD OF MEASUREMENT:

Conduit of the different types and sizes, both new and relaid, will be measured by the linear foot (m) in place, the measurement being made along the centerline of each pipe installed. Branch connections, tees, wyes, and elbows will be measured along their centerlines and these lengths included in the total lengths of the appropriate conduit. Wyes, tees, and other branch connections will be measured along the centerlines to points of intersection. Conduit with sloped or skewed ends will be measured along the invert. The portion of pipe extending through to the inside face of headwalls of all types, manholes, inlets, boxes, or other structures shall be included in the measurement.

604.13

End sections will be measured by the number of units installed.

Conduit designated on the Plans to be installed by the jacking method will be measured separately by the linear foot (m) in place and shall be the actual portion jacked, completed in place, and accepted.

604.13-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed in 604.14, which prices and payments shall be full compensation for excavation and bedding, except as otherwise provided, backfilling, jacking when called for, furnishing all materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work. The unit price bid for end sections shall include excavation and backfill.

When, by the authority of the Engineer, the flow line of a conduit is lowered from that shown on Plans, or due to a lack of a firm foundation, or due to a solid rock foundation, unsatisfactory material is removed and replaced with suitable material, the work of excavation, replacement, and compaction of material will be paid for in accordance with 109.4.

- i. For conduits less than 48-in. (1200 mm) diameter, the work of excavation, measured in excess of 1 ft. (300 mm) below the original planned conduit elevation, will be paid for under the provisions of 109.4. When suitable material is not available from the project excavation, payment for replacement material below final grade line will be made in accordance with 109.4.
- ii. For conduits 48-in. (1200 mm) diameter or larger, all additional excavation below the original planned conduit elevation and for a width not in excess of the outside conduit diameter plus 18 inches (450 mm) on each side of the conduit, will be paid for at the unit bid price for Item 207001-* "UNCLASSIFIED EXCAVATION". When no Item 207001-* is included in the Proposal, payment for excavation, backfill compaction and replacement material will be made in accordance with 109.4. When suitable material is not available from the project excavation, replacement material will be paid for in accordance with 109.4.

SECTION 605 MANHOLES AND INLETS

605.1-DESCRIPTION:

This work shall consist of the construction of new and adjustment of existing manholes and inlets in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions and locations shown on the Plans or established by the Engineer. Types of manholes and inlets shall be as shown on the Plans.

605.2-MATERIALS:

Cast-In-Place concrete and reinforcing steel for manholes and inlets shall meet the requirements of 601 (Class B) and 602 respectively. Precast concrete manholes shall conform to 715.19. Portland cement concrete for precast inlets shall meet the requirements in 715.19. Other requirements and details for precast inlets shall be as specified on the Plans.

Other materials shall meet the requirements specified in the following Subsections of Division 700:

MATERIAL	SUBSECTION
Clay or Shale Brick	715.16
Concrete Brick	715.17
Concrete Masonry Blocks	715.18
Joint Mortar	708.8
Gray Iron Castings	709.10
Manhole Steps	709.10, 715.19, 715.38
Pipe for Slot Inlets	713.2
Aggregate for Slot Inlets (Aggregate For Fabric Underdrain)	606.2
Fabric for Slot Inlets	715.11

Lean grout backfill, where specified on the Plans, shall consist of 3 bags of cement per cubic yard (167 kg of cement per m³) of material suitable to the Engineer.

Component materials shall be sampled, tested, and approved prior to the start of manufacture. Manholes and inlets shall be inspected at the manufacturing plant, if acceptable they shall be identified in accordance with MP 700.00.01.

All materials will be subject to inspection for acceptance as to condition at the latest practicable time the Engineer has the opportunity to check for compliance prior to or during incorporation of materials in the work.

Covers and frames for manholes and grates, frames, and grate support bars for inlets shall be gray iron castings except for Type G Inlets which require structural steel meeting 709.12.

605.3-CONSTRUCTION METHODS:

Concrete construction shall conform to the requirements for 601. Masonry shall conform to the requirements for the respective type. Exposed masonry surfaces shall be cured with wet burlap for a period of not less than 48 hours. Concrete surfaces shall be cured in accordance with 601.12.

Metal frames for inlets shall be set in a full mortar bed or cast into the concrete. Pipe sections shall be flush on the inside of the structure wall and project outside sufficiently for proper connection with the next pipe section.

Masonry shall fit neatly and tightly around the pipe. The flowline of the outlet pipe shall match the bottom elevation of the inlet or manhole. When the bell or groove of concrete pipe is placed in an inlet, the inside of the bell or groove shall be filled with concrete up to the flowline.

Bearing areas of frames, covers, and grates shall be so fitted and finished as to provide a firm, even seat for the entire cover or grate in the frame. No projections shall exist on the bearing areas of the castings; and the cover or grate shall seat in the frame without rocking.

Concrete inlets and manholes may be precast when shapes and dimensions conform to those shown on the Plans and when final installed top surfaces are flush with adjacent finish surfaces such as pavement, gutters, curbs, and sidewalks. Precast units shall include lifting hooks which will be out of sight after placement of the units and sufficient reinforcement to resist handling stresses.

Excavation and backfill shall be done in accordance with 212.

Weep holes shall be installed in the sidewalls of inlets during construction. These weep holes shall be constructed of non-rusting material, approximately 4 inches (100 mm) in diameter, located at or below subgrade elevation as directed or approved by the Engineer to properly drain subsurface material. Loose rock shall be placed around the outside of the structure at the openings or similar protective measures taken to prevent excessive backfill material from passing through the weep holes. The cost of weep hole installations shall be included in the unit price bid for the inlets. No deduction in concrete quantities shall be made for weep holes in the inlets.

When grade adjustment of existing structures is specified, the work shall be accomplished by one of the following methods:

- i. Carefully remove the existing frame; reconstruct the walls as necessary; clean and reset the existing frame in a full mortar bed at the required elevation.
- ii. Carefully remove the existing cover or grate and furnish and install an approved adjusting ring or casting.

605.4

Upon completion, each structure shall be cleaned of any accumulations of silt, debris, or foreign matter of any kind and shall be kept clear of such accumulation until final acceptance of the work.

605.4-METHOD OF MEASUREMENT:

Manholes and inlets, new or adjusted will be measured by the unit; slot inlets will be measured by the linear foot (m) in place.

605.5-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for as provided below, which prices and payments shall be full compensation for furnishing the excavation, backfill, concrete, aggregate, reinforcing steel, fabric, grates, covers, frames, hardware, and other materials shown on the Plans and for doing all the work, including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

When changes in Plans during construction require increases of depth in excess of 1 ft. (300 mm), the equitable price adjustment will be equal to the bid amount increased by a factor of the constructed depth less 1 ft. (300 mm) divided by the Plan depth.

When grade and drain contracts are bid separately from paving contracts, the structure may be designated to be partially built by the grade and drain Contractor and later completed by the paving Contractor.

SECTION 606 UNDERDRAINS

606.1-DESCRIPTION:

This work shall consist of constructing underdrains and free draining base trenches using pipe and granular material, blind drains, aggregate filled engineering fabric, prefabricated pavement edge drain and underdrain pipe outlets in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions and locations shown on the Plans or established by the Engineer.

When Item 606025-*, UNDERDRAIN PIPE, per linear foot (meter), is included as a pay item in the Contract, any of the following pipe types may be furnished for construction of the underdrain: bituminous coated corrugated steel underdrain pipe, corrugated aluminum alloy underdrain pipe, non-reinforced perforated concrete underdrain pipe, porous concrete pipe, standard strength perforated clay pipe, extra strength perforated clay pipe perforated bituminous fiber underdrain pipe, corrugated stainless steel underdrain pipe, precoated, galvanized steel pipe for underdrains, corrugated polyethylene underdrainage pipe or perforated plastic semicircular pipe.

606.2-MATERIALS:

Material shall meet the requirements specified in the following Subsections of Division 700:

MATERIAL	SUBSECTION	TYPE OR GRADATION
Metallic Coated Corrugated Steel Pipe for underdrains	713.11	Class I, II or III
* Bituminous Coated Corrugated Steel Pipe for Underdrains	713.12	Class I, II or III
***Corrugated Aluminum Alloy Pipe for Underdrains	713.16	Type I, II, II or IV
***Bituminous Coated Corrugated Aluminum Alloy Pipe for Underdrains	713.17	Type I, II, II or IV
* Precoated Metallic Coated Steel Pipe for Underdrains	713.23	Class I or II, Type B Coating

MATERIAL	SUBSECTION	TYPE OR GRADATION
Corrugated Stainless Steel Pipe for Underdrains	713.7	
Non-Reinforced Perforated Concrete Underdrainage Pipe	714.5	Class I 2 or 3
Porous Concrete Pipe	714.6	Class I or II
Standard Quality Concrete Drain Tile	714.7	
Extra Quality Concrete Drain Tile	714.7	
Special Quality Concrete Drain Tile	714.7	
Standard Clay Drain Tile	714.8	
Extra Quality Clay Drain Tile	714.8	
Heavy Duty Clay Drain Tile	714.8	
Standard Strength Perforated Clay Pipe	714.10	
Extra Strength Perforated Clay Pipe	714.10	
Cradle Invert Clay Pipe	714.10	
**Bituminous Fiber Pipe: Non-Perforated	714.14	
Perforated	714.15	
*****Crushed Stone for Underdrains	703.1 & 703.4	AASHTO Size # 67, 7 or 78
*****Gravel for Underdrains	703.2 & 703.4	AASHTO Size # 67, 7 or 78
Silica Sand for Underdrains	702.1.2, 702.1.3 & 702.6	
Engineering Fabric	715.11	

MATERIAL	SUBSECTION	TYPE OR GRADATION
Concrete for Miscellaneous Uses	715.12	
Prefabricated Pavement Edge Drain	715.10.1	

* Unless otherwise specified, Class IV, semicircular pipe 4 5/8 inches (117 mm) in diameter, may be furnished when 6 inch (150 mm) diameter pipe is called for on the Plans.

** Unless otherwise specified. Perforated pipe shall be used.

*** Unless otherwise specified. Type V, semicircular pipe 4 5/8 inch (117 mm) in diameter, may be furnished when 6 inch diameter pipe is called for on the Plans.

**** Plastic semicircular pipe may be furnished only when six (150 mm) diameter is called for on the Plans.

***** Aggregate for aggregate filled fabric underdrain shall consist of crushed stone conforming to the requirements of 703.1 or gravel conforming to the requirements of 703.2. The grading may be any standard AASHTO size between # 2 and # 57, inclusive, but only one size may be used at any one installation. Pea gravel as described in 703.2.3 may also be used.

When the locations of manufacturing plants allow, the plants may be inspected periodically for compliance with specified manufacturing methods, and material samples may be obtained for laboratory testing for compliance with material quality requirements. This may be the basis for acceptance of manufacturing lots as to quality.

All materials will be subject to inspection for acceptance as to condition at the latest practicable time the Engineer has the opportunity to check for compliance prior to or during incorporation of materials in the work.

CONSTRUCTION METHODS

606.3-PIPE INSTALLATION:

606.3.1-Trenching: Trenches shall be excavated to a width of the outside diameter of the pipe plus 1 ft. (300 mm), to a depth of 4 inches (100 mm) below the flow line, and to the grade required by the Plans or as directed. Trench walls shall be as nearly vertical as practicable.

606.3.2

606.3.2-Bedding and Placing Pipe: A minimum 4 inch (100 mm) bedding layer of crushed gravel shall be placed in the bottom of the trench for its full width and length.

Subdrainage pipe of the type and size specified shall be embedded firmly in the bedding material. Upgrade ends of all underdrainage pipe installations shall be closed with suitable plugs to prevent entry of soil materials.

Perforated pipe shall normally be placed with the perforations down. Flexible pipe sections shall be joined with couplings or bands as recommended by the manufacturer. Non-perforated pipe and rigid pipe shall be firmly set and laid with the bell and groove ends upgrade and with open joints, wrapped with suitable material when specified, to permit entry of water.

606.3.3-Placing Filter Material: After the pipe installations have been inspected and approved, crushed stone or crushed gravel shall be placed to a height of 6 inches (150 mm) above the top of pipe. The trench shall then be filled with silica sand to a minimum thickness of 12 inches (300 mm) over the top of the filter stone or gravel. In the event damp trench sides indicate the necessity; the Engineer may direct an increase in the thickness of the silica and cover. When the underdrain is used to drain the base or subbase, course, the sand filter shall be carried vertically to the bottom of the base or subbase. Care shall be taken not to displace the pipe or the covering at open joints.

When there is a heavy percolation of water into the trench at underdrain level, the Engineer may substitute sand for the crushed stone or gravel bedding, cover and filter.

606.3.4-Backfill: Above the sand filter, when underdrains are not used to drain the base or subbase, the trench shall be filled with suitable random material, as shown on the Plans or as directed by the Engineer, in layers not exceeding 4 inches (100 mm) after compaction. The use of bulldozers or other blade equipment in backfilling is expressly prohibited.

The quality control testing and acceptance of suitable soil, soft shale or granular material will be according to applicable sections of 207 and 716, with the following exceptions:

A lot normally consist of the quantity of backfill material required to backfill 100 linear ft. (30 m) of the installation, or as directed by the Engineer.

For underdrain installations in an embankment, where existing tests are on file for the adjacent embankment material, the target percentage of dry density for the suitable random backfill will be equal to the X value of the tests in the adjacent lot of embankment material or a minimum value of 95, whichever is greater. For embankments where no tests are on file, the target percentage of dry density will be 95.

606.3.5-Underdrain Outlets: Trenches for underdrain outlets shall be excavated as for underdrains, except that the depth of the trench shall be limited to the flow line. Pipe shall be laid in the trench with all ends firmly joined by the applicable methods and means. The use of perforated pipe may be omitted

or, if used, it shall be laid with perforations up. No filter material shall be used. After inspection and approval of the pipe installation, the trench shall be backfilled with suitable material in layers and compacted as provided for underdrains.

606.4-UNDERDRAIN STRUCTURES:

606.4.1-Underdrain Junction Boxes: Underdrain junction boxes shall be constructed to the dimensions and elevations at locations as shown on the Plans or as directed.

606.4.2-Slope Walls for Underdrains: Slope walls for underdrains shall be constructed of concrete conforming to the requirements of 715.12 of the Specifications and shall be constructed to the dimensions and elevations at locations as shown on the Plans or as directed.

606.5-SPRING CONTROL:

Underdrain spring boxes and underdrain for spring control shall be constructed to the dimensions and elevations at locations as shown on the Plans, or as directed. Any remaining upper portion of the trench shall be filled and compacted as for underdrains.

606.6-AGGREGATE FILLED FABRIC UNDERDRAIN AND BLIND DRAINS:

Trenches for aggregate filled fabric underdrains and blind drains shall be excavated to the width and depth shown on the plans. The trench shall be prepared to a relative smooth state, free of sharp protrusions, depressions, and debris.

When fabric is used, it shall be placed with the long dimension parallel to and centered with the alignment of the trench. It shall be placed in the trench in reasonable conformance with the shape of the trench and shall be smooth and free of tension, stress, folds, wrinkles or creases. The fabric shall be installed so that any splice joints have a minimum overlap of at least 2 feet (600 mm) in the direction of flow. The overlap of the closure at the top shall be approximately the width of the trench and shall be temporarily used to cover the excavated material on either side of the trench.

The aggregate shall be placed by any method which will result in the trench being completely filled to the line shown. The filling process shall not cause the permeability of fabric to be impeded.

The fabric, when used, shall be overlapped at the top of the aggregate. Any portion of the trench not filled with aggregate shall be backfilled in accordance with 606.3.4.

606.7 - PREFABRICATED PAVEMENT EDGE DRAIN:

Trenches for prefabricated pavement edge drain shall be excavated to the dimensions and grade shown on the Plans.

606.8

The edge drain shall be placed against the pavement side of the trench and held firmly in place while backfill is placed to a compacted height of not more than 6 inches (150 mm). For one-sided drains, the more open side shall be placed toward the pavement. After the first lift is compacted and any tears in the fabric have been satisfactorily repaired, the remainder of the backfill shall be placed and compacted in layers not exceeding 6 inches (150 mm) deep. All compaction shall be accomplished with a vibratory compaction system. The backfill shall be the material excavated from the trench. Unless otherwise approved by the Engineer, the excavation of the trench, the placement of the edge drain, and the placement of the first lift of backfill shall be accomplished in a single continuous operation.

Each segment of edge drain shall be joined to the adjacent segment prior to installation. Splices shall keep the adjoining edge drain in proper alignment and shall not separate during installation.

Four inch (100 mm) diameter non-perforated outlet pipes shall be installed to provide positive drainage at low points of sags, at the low ends of all runs and at intervals not exceeding 500 ft. (150 m) on continuous runs, except edge drains with two separate flow channels shall have a crossover coupling at approximately 250 ft (75 m). The manufacturers' recommended fittings shall be provided for attaching the edge drains to the outlet pipes. A standard underdrain concrete slopewall shall be used at each pipe outlet unless the pipe is connected to a drainage structure. Slopewalls shall be fitted with a galvanized rodent screen.

The outlet pipe trench shall be constructed in accordance with 606.3.4 and 606.3.5 using as backfill the material excavated from the trench.

606.8- FREE DRAIN BASE TRENCH:

This work shall consist of constructing free draining base trenches and Outlet Pipes in accordance with these specifications and in reasonably close conformity with the lines, grades, dimensions, and locations shown on the plans or established by the Engineer.

606.8.1 - MATERIALS:

The perforated pipe as detailed on the plans shall meet the requirements of this Section.

The aggregate backfill as detailed on the plans shall meet the requirements of section 311.2 aggregate.

Engineering fabric shall meet the requirements of Subsection 715.11.8.

The Outlet pipe as detailed on the plans shall meet the requirements of Subsection 715.10.1.5.

CONSTRUCTION METHODS

606.8.2 - FDB TRENCH:

606.8.2.1 - Trenching:

The FDB trench shall be excavated to the width and depth as detailed on the plans. Trench walls shall be as nearly vertical as practicable

606.8.2.2 - Bedding and Placing Perforated Pipe:

After excavating the trench, Engineering fabric shall be placed in the trench in reasonable conformance with the shape of the trench. The Engineering fabric shall be smooth and free of tension, stress, folds, wrinkles, or creases. The Engineering fabric shall be installed so that any splice joints have a minimum overlap of at least 1 foot (300 mm) any direction. Enough Engineering fabric will be placed in order to properly tie to the mainline placement of Engineering fabric (Item 207034 -*).

A 2 inch (50 mm) bedding layer of crushed stone or gravel conforming to Section 311.2 aggregate shall be placed in the bottom of the trench for its full width and length.

The pipe shall then be placed in the trench. The pipe sections shall be joined with couplings or bands as recommended by the manufacturer.

After pipe installation, the remainder of the trench will be backfilled with crushed stone or gravel conforming to Section 311.2 aggregate.

606.8.3 - OUTLET PIPE:

606.8.3.1 - Connection to Perforated Pipe: At locations designated on the plans or as directed by the Engineer, rigid outlet pipe will be connected to the perforated pipe. A drop connection utilizing a tee or wye or other means as satisfactory to the Engineer will be used for this connection. This operation may be performed concurrently with the placement of the perforated pipe or separately.

606.8.3.2 - Trenching: The outlet pipe trench shall be excavated to the depth of the flow line of the outlet pipe. Minimum slope of the outlet pipe is to be 3%. Width of the trench will be that width which will allow proper room for pipe placement and backfilling operations.

606.8.3.3 - Placing and Backfilling Pipe: The outlet pipe shall be placed in the trench with all ends firmly joined by couplings or bands as recommended by the manufacturer.

The outlet pipe shall be backfilled with random material in accordance with Subsection 606.3.4

606.8.3.4 - Pipe End Treatment: The outlet end of all outlet pipes not tied to drainage structures shall be equipped with a slopewall.

Outlet pipes shall be tied to inlets or culverts by the use of pipe saddles, grouting Cementing, or other means satisfactory to the Engineer.

606.8.4 - METHOD OF MEASUREMENT:**606.8.4.1 - FDB Trench:**

The quantity of work done will be measured by the LF (m) of FDB

606.8.4.2

trench installed, complete in place and accepted. The perforated pipe is a component of the FDB trench. Length will be determined from actual measurements once the FDB trench is in place. No deductions will be made for placement of the drop connection required at outlet pipe locations.

606.8.4.2 - Outlet Pipe:

The quantity of work done will be measured by the LF (m) of rigid pipe complete in place and accepted. Angles, tees, wyes, and other branches which may be required will be included in the length of the outlet pipe. Measurement shall begin at the intersection of the perforated pipe and the rigid pipe.

Slopedwalls for outlet pipe and the connection of outlet pipes to drainage structures will not be paid for separately, but shall be included in the cost of the outlet pipe.

606.9-METHOD OF MEASUREMENT:

The quantity of work done will be measured by the linear foot (meter) for pipe, including outlet pipe, for each of the types and sizes as specified, complete in place and accepted. Length will be determined from actual measurements after the pipe is in place. Angles, tees, and wyes, and other branches which may be required will be measured from centerline of main pipe along the centerline of the branch to the end and the length included in the pipe length.

Crushed stone, gravel, or silica sand for bedding, filter, and spring control will be measured by the volume; the volume will be the product of the specified trench width and depth, and the length in place, less the volume of the pipe computed on the basis of the outside diameter of the barrel or corrugations.

Blind drains will be measured by the volume of granular material.

The quantity of work done for "Aggregate Filled Fabric Underdrains" will be measured in linear feet (meters) of trench, complete in place and accepted.

The quantity of work done for "Prefabricated Edge Drain" will be measured in linear feet (meters) of edge drain and outlet pipe, complete in place and accepted.

Volume will be computed on the basis of the specified trench depth and width, and the length in place.

Underdrain junction boxes will be measured by the unit.

Slopedwalls for underdrains will not be paid for separately, but shall be included in the cost of the underdrain pipe.

606.10-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for as provided below, which prices and payments shall be full compensation for furnishing the materials, excavation, placing pipe, filter material, edge drain, outlet pipe, backfill, disposing all surplus material and doing all the work, including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

Payment for engineering fabric for Free Drain Base Trench will be as Item 207034-.*.

SECTION 607 GUARDRAIL

607.1-DESCRIPTION:

This work shall consist of the construction or reconstruction of guardrail in accordance with these Specifications and in reasonably close conformity with the lines and grades shown on the Plans or established by the Engineer.

The types of guardrail are designated as follows:

Type 1, Galvanized Steel Deep Beam Type Guardrail

Type 2, Blank

Type 3, Blank

Type 4, Blank

Type 5, Galvanized Steel Double-Faced Guardrail (Deep Beam Type)

All installations of Type 1 & 5 Guardrail will be classified according to one of the designations specified. The guardrail class will be indicated in the pay items and on the Plans,

Class I: 6 ft. - 3 in. (1 905 mm) post spacing with blocks

Class II: 12 ft. - 6 in. (3 810 mm) post spacing with blocks

Class III: 12 ft. - 6 in. (3 810 mm) post spacing without blocks.

The construction of the guardrail shall include the complete furnishing, assembling and erecting of all component parts and materials at the location shown on the Plans or directed by the Engineer.

A Modified Cut Slope Terminal shall consist of supplying and installing additional length guardrail posts, an additional W-beam guardrail section (bottom beam), and standard guardrail cut slope terminal components

607.2-MATERIALS:

Materials shall meet the requirements of the following Subsections of Division 700:

MATERIAL	SUBSECTION
Galvanized Steel Deep Beam Type Guardrail Fasteners and Anchor Bolts	712.4
Steel Guardrail Posts	709.45
Pressure Treated Wood Guardrail Posts	710.3, 710.5
Zinc Rich Primer (Galvanized Repair)	711.21
Retroreflective Sheeting for Traffic Control	715.9.2.8
Concrete for Footers	715.12

All materials must be protected from damage during storage and handling. All materials, including materials which have been approved previously, will be subject to inspection by the Engineer as to condition at any time prior to or during incorporation of the material in the work. Materials which have been damaged shall not be used.

CONSTRUCTION METHODS

607.3-SETTING POSTS AND PLACING FOOTERS:

607.3.1-General: Unless one type is specified, posts may be of steel, or wood, and the Contractor shall indicate at the preconstruction conference the type of post the Contractor elects to use and that type shall be used throughout the Project.

Post dimensions and details shall conform to the requirements shown on the Plans.

Guardrail posts shall be placed as shown on the Plans.

Posts shall be set plumb in holes dug by hand or mechanically. When posts are driven, the manner of driving shall be such as to avoid battering or distorting of posts. Post holes shall be backfilled with acceptance material placed in maximum six inch (150 mm) loose layers and thoroughly compacted.

All posts damaged during erection or driving shall be removed and replaced without additional cost. Any damage to post galvanizing shall be repaired by a material meeting the requirements of 711.21.

Painting, when called for, shall not be done in damp or freezing weather and shall only be done when the posts are thoroughly dry.

607.3.2-Steel Posts: Galvanized steel posts shall not be painted except for touch up painting with zinc primer as specified.

607.3.3-Pressure Treated Wood Posts: All wood posts shall meet the

607.3.4

requirements of Section 710.

607.3.4-Blank

607.3.5-Offset Blocks: Offset blocks shall be used when called for by the Plans.

607.3.6-Footers for Breakaway Cable Terminal And Special Trailing End Terminal: Footers for breakaway cable terminal and special trailing end terminal shall be constructed of cast-in-place concrete meeting the requirements of 715.12. Concrete shall be placed promptly and without segregation after mixing.

Concrete footers shall be carried down to at least the depth, and shall be not less than the dimensions shown on the Plans. The top of all footers shall be not less than the dimensions shown on the Plans. The top of all footers shall be flush with the ground line and shall be troweled to a smooth finish with a slope to drain away from the post.

After excavating for the footer, the earth coming in contact with the concrete must be moistened to a depth of at least 2 inches (50 mm) just prior to placing the concrete in the hole. No curing will be required other than the placing of not less than 4 inches (100 mm) of loose moistened earth, free from clods or gravel, over the top of the footer immediately after placing the concrete. All excess excavation from footers and loose material used for curing shall be disposed of in a manner satisfactory to the Engineer.

607.4-ERECTING RAIL ELEMENTS:

607.4.1-General: Rail elements shall be erected in a manner resulting in a smooth, continuous installation.

All bolts, except where otherwise required, such as expansion joint bolts and adjustment bolts, shall be drawn tight. Bolts through expansion joints shall be drawn up as tight as possible without being tight enough to prevent the rail elements from slipping past one another longitudinally. Bolts shall be sufficiently long to extend at least ¼ in. (6 mm) beyond the nuts. Except where required for adjustment, bolts shall not extend more than ½ in. (13 mm) beyond the nuts. Bolts through variable thickness posts shall be cut off a maximum of ½ in. (13 mm) beyond the nuts.

All metal shall be fabricated in the shop. Burning, drilling or welding may be done in the field when shown on the Plans. Field punching, cutting, and drilling may be permitted after it has been demonstrated that it will not result in damage to the surrounding metal and if approved by the Engineer.

Galvanized surfaces which have been abraded so that the base metal is exposed, any field welded surfaces, threaded portions of all fittings and fasteners, and cut ends of bolts shall be protected with zinc rich primer or by field galvanizing, when approved by the Engineer.

607.4.2-Type 1 Guardrail (Galvanized Steel Deep Beam): The rail shall be erected so that the bolts at expansion joints will be located near the centers of the slotted holes. The rail elements shall be spliced by lapping in the direction of traffic. The rail elements at each splice shall make contact throughout the area of the splice. Shop-curved rail shall be used on curves with radii less than 150 ft. (45 m).

Any surface damage to galvanized beams shall be repaired with a material meeting the requirements of 711.21.

When called for, guardrail end terminals conforming to the details shown on the Plans shall be constructed.

607.4.3 to 607.4.4-Blank

607.4.5-Type 5 Guardrail (Galvanized Steel, Double-Faced): This rail shall be erected in accordance with the requirements of 607.4.2 and as shown on the Plans.

607.5-GUARDRAIL REMOVED AND REBUILT OR STORED:

This item shall consist of carefully dismantling, removing, and reerecting or storing, at the location specified on the Plans, of existing guardrail. Rebuilt units shall be of the same type, spacing of members, etc., as original guardrail.

New material specified on the Plans shall conform to the requirements for the construction of new guardrail of the type being reset.

All salvagable materials shall be removed and reerected (or stored if so specified) with reasonable care. Posts, rails, fabric, and cables for reerected rails shall be obtained from salvage sources, but the Contractor shall furnish whatever additional bolts, clips, or incidental hardware as may be necessary to complete the guardrail.

Methods of re-erection shall conform to the requirements for the construction of new guardrail of the type being reset, except as modified on the Plans.

Where removal and storage is specified, the bolts, cables, and other hardware shall be carefully removed from all rails, posts, and other members, and all parts shall be sorted and stored at the locations specified. Rails shall be properly stacked, cable shall be free from kinks and rewound on the cable spools, and all such reasonable care shall be exercised in the handling, storing, and preserving of materials as will insure the maximum salvage value for the entire operation.

607.6-METHOD OF MEASUREMENT:

The quantity of work done will be measured in linear feet (meters) of guardrail of the type indicated on the Plans, complete in place and accepted, measured along the face of the rail from center to center of end posts. the linear feet (meters) of double-faced guardrail will be measured along the face of one rail only.

607.7

When end terminals or attenuators for steel beam type guardrail are used, they will be measured separately and will be the actual number of end terminals or attenuators constructed, complete in place and accepted.

Where 25 ft. (1620 mm) sections of steel deep beam guardrail having 3 ft. - 1½ inches (952.5 mm) or 6 ft. - 3 inches (1905 mm) post spacings are utilized at bridges, they will be measured and paid for as 6 ft. - 3 inches (1905 mm) post spacing with blocks (Class I) and in accordance with their appropriate guardrail type.

Where 18 ft. - 9 in. (5 715 mm) sections of guardrail - bridge transitions, having 3 ft.- 1½ in. (952.5 mm) and 1 ft. - 6¾ in. (476.25 mm) postspacings, are utilized at bridges or in conjunction with other structures, these sections shall be measured and paid for as W-Beam Guardrail Bridge Transition. The cost of the double, top w-beam (12 ft. - 6 in. section (3 810 mm)), bottom w-beam (rubrail), guardrail end special hardware, connectors and incidentals utilized in guardrail - bridge transit shall be included in W-Beam Guardrail Bridge Transition.

Where w-thrie beam guardrail - bridge transitions consisting of two nested thrie beam panels and a transition section from w-beam to the thrie hewn guardrail having a total length of 18 ft. - 9 in. (5 715 mm) are utilized at bridges or in conjunction with other structures, these sections shall be measured, and paid for as Thrie Beam Guardrail Bridge Transition. The cost of the double thrie beam 12 ft. - 6 in. sections (3 810 mm), the 6 ft. - 3 in. (1 905 mm) section of w-thrie beam transition, the 6 ft. - 6 in. (1 901.2 mm) length steel posts, guardrail terminal connectors, and all special hardware, connectors, and incidentals utilized in this guardrail - bridge transition shall be included in Thrie Beam Guardrail Bridge Transition.

Where guardrail end terminals per the approved list on file with the Materials Section of the Contract Administration Division are utilized on projects, these terminals shall be measured and paid for as Flared End Terminal or Tangent End Terminal as shown in the plans. The cost of all hardware shown on the pre-approved shop drawings for the end terminals and the reflective sheeting on the nose of the terminal shall be included in the cost of the Flared End Terminal, per each or Tangent End Terminal, per each.

607.7-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall constitute full compensation for furnishing, preparing, placing, and erecting all materials, and all labor, tools, equipment, supplies such as nuts, bolts, washers, cables and any other incidentals necessary to complete the work.

Payment for modified cut slope terminals will include extra length guardrail posts as required, excavating and backfilling the trench, and reshaping, seeding and mulching of the cut slope for Cut Slope Terminal Type A Modified; shall include extra length guardrail posts as required, drilling holes into the cut slope, and furnishing and installing rock bolts (2), end shoes (2), and hardware for Cut Slope Terminal Type B Modified: and shall be paid for Cut Slope Terminal

Type A or B Modified ", per each.

607.8-PAY ITEMS:

* Sequence Number

SECTION 608
RIGHT-OF-WAY FENCE

608.1-DESCRIPTION:

This work shall consist of the construction of fences and gates of the types designated, in accordance with these Specifications and in reasonably close conformity with the lines, grades, locations, and dimensions shown on the Plans or established by the Engineer.

608.2-MATERIALS:

Materials shall meet the requirements specified in the following Subsections of Division 700:

MATERIAL	SUBSECTION
* Chain Link Fence	712.8
Farm-Field Fence (Woven Wire)	712.9
Barbed Wire	712.10
Steel Posts, Post Braces and Gate Frames	709.46
Pressure Treated Wood Posts and Braces	710.3, 710.5
Zinc Rich Primer (Galvanized Repair)	711.21
Aluminum Paint (Aluminum-Coated Repair)	711.9
Concrete for Footers	715.12

*Chain link fence fabric may be zinc-coated steel or aluminum-coated steel.

Posts for farm-field fence may be of either steel or wood, and the Contractor shall indicate at the pre-construction conference the type of post the Contractor elects to use and that type shall be used throughout the Project.

Gate frames shall be constructed of tubing having the dimensions and weights called for on the Plans. Gate frames may be constructed using pressed steel corner fittings or die-cast aluminum corner fittings, may be provided with heavy malleable iron corner fittings or otherwise shall be of an adequate, sturdy design. Gate frame corner attachments may be of welded construction, if the gate frame receives its coating protection after fabrication of the gate structure is completed. All gate frames shall have truss rods as shown on the Plans.

All gates shall be equipped with approved latches, stops, suitable locking devices, and satisfactory provisions for padlocking. Means shall be provided for securing and supporting the free ends of vehicular gates in the open position. Hinges shall be malleable iron, pivot type, heavy and strong, with large bearing surfaces for clamping onto the posts, or equal. Hinges shall not twist or turn under the action of the gate and shall be so arranged that a closed

gate cannot be lifted off its hinges to obtain entry. Vehicular gates shall be capable of being operated easily by one person and shall be of the full 180 degree open swing type. Pedestrian gates shall be equipped with a positive stop which will not permit the gate to swing toward the highway and shall be provided with a satisfactory spring or other positive means to maintain the gate in a closed position.

The filler fabric for pedestrian gates and vehicular gates shall comply with the requirements for the fencing fabric of the fence in which the gate is to be installed.

Miscellaneous hardware and fittings shall conform to the details shown on the Plans or other alternate designs acceptable to the Engineer.

When the locations of manufacturing plants allow, the plants will be inspected periodically for compliance with specified manufacturing methods, and material samples will be obtained for laboratory testing for compliance with materials quality requirements. This may be the basis for acceptance of manufacturing lots as to quality.

All materials must be protected from damage during storage and handling. All materials, including materials which have been approved previously, will be subject to inspection by the Engineer as to condition at any time prior to or during incorporation of the material in the work. Materials which have been damaged shall not be used.

CONSTRUCTION METHODS

608.3-GENERAL:

The Contractor's activities and operation shall be confined to the area immediately adjacent to the right-of-way fence and within the highway right-of-way. The Contractor shall be responsible for satisfactory arrangements for such permits as required by them from adjacent owners in performing the work.

If the installation of certain portions or lengths of the right-of-way fence is more essential than other portions or lengths, the Engineer may designate the portions or lengths of the fence that are most essential, and the Contractor shall conduct his operations so as to give priority to the erection of such portions or lengths.

When temporary fence is not provided as a separate bid item in the Contract, the Contractor may defer installation of the permanent right-of-way fence by erecting and maintaining adequate temporary fence. The Contractor shall be responsible for prohibiting livestock from entering upon the work area and to contain livestock in the property residues from which it is necessary to remove the existing fence.

608.4-CLEARING, GRUBBING, AND TRENCH EXCAVATION:

The Contractor shall perform such clearing and grubbing as may be necessary to construct the fence to the required grade and alignment.

When necessary in areas of irregular ground to secure clearance between the ground line and the bottom of the fence fabric, to obtain the established

608.5

grade, or to permit placing steel barbed wire below the bottom of the fence fabric at stream crossings and minor depressions, a trench shall be excavated to the grade and line established or designated. In the areas where rock is encountered, the rock shall be excavated as may be necessary, in the opinion of the Engineer, to the required grade and line. Any excavation of rock below the required grade shall be backfilled with suitable materials as directed. Trenches shall be so constructed as to insure proper drainage and shall be of the cross section shown on the Plans or as directed. In general, the bottom of the fence shall follow the contour of the ground in accordance with usual practice in constructing fence of the type specified, and it is not anticipated that a great amount of shallow trench excavation will be required.

608.5-CONCRETE FOOTERS:

Footers, where required, shall be constructed of cast-in-place concrete meeting the requirements of 715.12. Concrete shall be placed promptly and without segregation after mixing.

Concrete footings shall be carried down to at least the depth, and shall be not less than the dimensions, shown on the Plans. The top of all footings shall extend slightly above the ground line and shall be steel troweled to a smooth finish with a slope to drain away from the post. Posts, braces, and other units shall be approximately centered in their footings.

If the ground is firm enough to permit excavation of a hole to neat dimensions, the concrete may be placed without forms by completely filling the hole. In this case, the earth coming in contact with the concrete must be moistened to a depth of at least 2 inches (50 mm) just prior to placing the concrete in the hole. No curing will be required other than the placing of not less than 4 inches (100 mm) on loose moistened earth, free from clods or gravel, over the top of the footing immediately after placing the concrete.

Where the ground cannot be satisfactorily excavated to neat dimensions, forms shall be used for footings. In this case, where the soil is not moist, not less than one gallon (4.0 liters) water shall be placed in the bottom of each hole; and, as soon as the water has been absorbed, the concrete shall be placed.

Forms shall be removed not sooner than 24 hours after placing of concrete. As soon as each form is removed, the footing shall immediately be backfilled with thoroughly moistened material in six inch (150 mm) loose layers and solidly tamped. The top shall be covered with not less than 4 inches (100 mm) of loose moistened earth. All excess excavation from footings and loose material used for curing shall be disposed of in a manner satisfactory to the Engineer.

608.6-SPACING AND SETTING POSTS

608.6.1-General: Posts shall be spaced in the line of fence as shown on the Plans with a tolerance of minus 2 feet (600 mm). Spacing of posts shall be as uniform as practicable under local conditions.

In general, in determining the post spacing, measurements shall be made parallel to the ground slope, and posts shall be placed in a vertical position

except in unusual locations where it would be more satisfactory to place the posts perpendicular to the ground slope and the Engineer so directs.

At all horizontal angle points, vertical angle points, and terminal points of the right-of-way fence, corner, pull, or end posts shall be placed, as the situation may demand, along with the necessary amount of bracing and number of approach posts as shown on the Plans. Steel line posts shall be spaced at a maximum of 10 ft. (3 m) center to center, and wooden line posts shall be spaced at a maximum of 15 ft. (4.5 m) center to center along the fence line. For chain link fence with steel posts and farm-field type fence with wooden posts, intermediate post assemblies shall be placed at 400 ft. (120 m) intervals (maximum) center to center from corner, gate, pull, or end posts, except where the distance is 500 ft. (150 m) or less between any combination of such posts.

For farm-field type fence with steel posts, intermediate post assemblies shall be placed at 330 ft. (100 m) intervals (maximum) center to center from corner, gate, pull, or end posts, except where the distance is 400 ft. (120 m) or less between any combination of such posts. Gate posts shall be placed in the fence line where required and as directed by the Engineer. Details of all installations shall be as shown on the Plans.

Extra length posts shall be required at small ground depressions and also at stream crossings, less than 15 ft. (4.5 m) for wooden posts and less than 10 ft. (3 m) for steel posts, where it is not practicable for the fencing to closely follow the contour of the ground. Details of these installations shall be as shown on the Plans. The location of extra length shall be as dictated by the topography and as directed. Additional bracing shall be provided for extra length posts when shown on the Plans or directed. The Contractor shall close the space below the bottom of the fence fabric with barbed wire, stretched tautly between posts either on horizontal lines or fanned, as shown on the Plans or directed. At stream crossings greater than 15 ft. (4.5 ft.) for wooden posts and greater than 10 ft. (3 m) for steel posts, the fence shall be constructed as shown by special detail on the Plans or as directed. No special payment will be made for extra length posts, bracing, wire, fittings, etc., required at stream crossings or depressions.

Attention is directed to the fact that some posts may occur at or on existing roadway pavements, on old concrete foundations, or similar solid surfaces. There will be no additional compensation for breaking up such surfaces to set the posts. The Contractor may adjust the spacing to reduce the number of posts occurring on such surfaces subject to the maximum spacing specified, and there will be no additional compensation due to any increase in the number of posts when the Contractor elects to do so.

608.6.2-Wooden Posts: At the option of the Contractor, treated wood posts may be driven into place, provided the method of driving does not damage the post; or they may be installed in drilled or dug holes and backfill and compacted to the satisfaction of the Engineer. In any event, the posts shall be set solidly and any space left around the posts shall be backfilled and compacted as specified.

608.6.3

When posts are to be driven, the top of the posts shall be tapered to fit the driving head so that no gouging of the post will result. Any posts split or broken during driving operations shall be replaced at the Contractor's expense.

All wooden posts shall be placed with their large ends in the ground.

When setting posts in dug or drilled holes of dimensions larger than the post, the space around the posts shall be backfilled in layers of maximum six inch (150 mm) loose thickness, and each layer shall be thoroughly tamped. If the backfill material is too dry to compact to the satisfaction of the Engineer, it shall be dampened as it is placed.

608.6.3-Steel Posts: All steel end, corner, pull, gate, approach, intermediate assembly posts, and diagonal braces shall be set in concrete footings having the dimensions called for on the Plans. The dimensions of the footings may be varied as permitted by the Engineer but shall provide an equal volume of concrete. Except where rock is encountered, line posts shall be set or driven into the ground; and, in farm-field type fence, line posts shall be furnished with an approved plate or other satisfactory anchoring device to hold the post in proper alignment. The plate or anchor shall be satisfactory welded or riveted (not less than two rivets) to the post. Any post damaged by driving will be rejected.

608.6.4-Posts Set in Rock: If solid rock is encountered above the required elevation of the bottom of a post, a hole shall be drilled into the rock to the normal depth of the post or 18 inches (450 mm) into rock, whichever is less. In the latter case, the post shall be cut off at the bottom, if necessary, to provide the required post height above the ground surface. The diameter of post holes in rock shall be at least 3 inches (75 mm) greater than the largest dimension of the post.

For all posts, the portion of the post extending into rock shall be grouted in place. Grout shall consist of one part portland cement and three parts of sand, thoroughly mixed with a sufficient quantity of water to bring the mixture to a thick, but workable, consistency. For all wood posts and metal line posts, the excavation above the top of the rock shall be backfilled with material placed in six inch (150 mm) (maximum) loose layers and each layer thoroughly compacted. The anchor plate shall be removed when metal line posts (farm-field type) are to be set in rock. For all other metal posts, the concrete footings, as previously specified, shall be cast-in-place between the top of the rock and the ground surface.

608.7-ERECTION OF FENCING MATERIALS:

608.7.1-General: In cases where the controlled access line and the right-of-way line are not coincident, fence shall normally be erected along the controlled access line. When fencing follows either line, the fence shall normally be erected parallel to and 1 ft. (300 mm) inside the line. If this would result in undesirable appearances or unsatisfactory operational characteristics, the fence location shall be adjusted accordingly. In any case, the fence shall be

erected to the lines and grades shown on the Plans or established by the Engineer.

The Contractor shall clear the area, from the line of fence to a line approximately 4 feet (1200 mm) within the line of fence, of brush, undergrowth, etc., as directed by the Engineer. Such clearing shall be conducted in such a manner as to leave intact valuable trees and selected native growth. Only such trees as are directly on the line of the fence or that would otherwise, in the opinion of the Engineer, interfere with the construction of the fence, shall be removed by cutting then flush with the ground.

Materials removed in clearing shall be disposed of by the Contractor outside of the right-of-way and out of sight of any part of the highway in a manner approved by the Engineer, unless disposal within the right-of-way is specifically approved in writing by the Engineer.

The tension for stretching the fence shall be applied by use of mechanical fence stretchers and single wire stretchers designed and manufactured for that purpose and in accordance with the fence manufacturer's recommendations. The finished fence shall be true to line, taut, and solid at all points.

Posts shall be permanently positioned and concrete footings fully set before fabric is placed. Unless otherwise permitted, no fencing materials shall be installed on posts until seven days have elapsed from the time of placing of the concrete.

Barbed wire shall be placed at locations indicated on the Plans.

608.7.2-Farm-Field Fence (Wood Posts): Corner and pull posts shall be braced in two directions, and end and gate posts shall be braced in one direction. The braced post and the adjacent approach posts shall each be notched 1 in. (25 mm) deep at 8 inches (200 mm) from the top of the posts to the center of the notching to receive the horizontal brace. The horizontal wooden braces shall then be inserted into the notches and doweled to the posts with $\frac{5}{8}$ in. (16 mm) diameter galvanized steel pins 5 inches (125 mm) long.

Diagonal wire bracing shall consist of double strand # 9 gage wire, installed as shown on the Plans, which shall comply with the requirements for the fencing fabric. Two loops shall be made around each post at each point of attachment, the wires stapled to the posts, and the wires fastened back on themselves by means of at least three twists tightly wrapped. The strands of wire shall then be twisted together until the wooden brace is in compression. The compression shall not be great enough to cause lateral springing in the brace.

The placing and connecting of horizontal wooden braces and diagonal wire bracing for intermediate post assemblies shall be similar to that described above and shall be as shown on the Plans.

The bottom of the fabric of farm-field fence shall be placed a normal distance of 3 inches (75 mm) above the ground line; however, over irregular ground a minimum clearance of 2 inches (50 mm) and a maximum clearance of 6 inches (150 mm) will be permitted for a distance not to exceed 8 feet (2.4 m). Any necessary excavation and backfilling required in order to comply with

608.7.3

these provisions shall be made as specified.

At all line and approach posts the fencing material shall be securely fastened to the posts by means of 1-½ inches (40 mm) minimum # 9 wire galvanized staples. At end, pull, corner, intermediate assembly, and gate posts the lateral wires of the fencing material shall be wrapped tightly around the posts and the wire fastened back on themselves by means of at least three twists tightly wrapped. The fence fabric and barbed wire shall be attached to all posts at the vertical spacings shown on the Plans.

Fence fabric and barbed wire shall be fastened tightly to corner, pull, end, gate, and intermediate assembly posts for each straight run of fence, with each wire of the fabric being stapled to the posts before the fabric and barbed wire are fastened to the in-between line and approach posts. At the line and approach posts, the top and bottom wires and every other in-between wire of the fabric shall be stapled, alternating the stapling of the in-between wires on successive posts.

608.7.3-Farm-Field Fence (Steel Posts): Corner, pull, and intermediate assembly posts shall be braced in two directions, and end and gate posts shall be braced in one direction. These posts shall be braced by means of diagonal steel rods, connected to the posts and anchored in the ground in concrete footings, installed and having the dimensions as shown on the Plans.

The bottom of the fabric of farm-field fence shall be placed a normal distance of 3 inches (75 mm) above the ground line; however, over irregular ground a minimum clearance of 2 inches (50 mm) and a maximum clearance of 6 inches (150 mm) will be permitted for a distance not to exceed 8 feet (2.4 m). Any necessary excavation and backfilling required in order to comply with these provisions shall be made as specified.

At all end, corner, pull, gate, and intermediate assembly posts, the lateral wires of the ends of the fencing material shall be wrapped tightly around the posts and the wires tied back on themselves with not less than three twists tightly wrapped. The fencing material shall be fastened to line posts by approved ties or clips. The fence fabric and barbed wire shall be attached to all posts at the vertical spacing shown on the Plans.

Fence fabric and barbed wire shall be fastened tightly to corner, pull, end, gate, and intermediate assembly posts for each straight run of fence, with each lateral wire of the fabric attached, as specified above, before the fabric and barbed wire are fastened to the in-between line posts. At line posts, the top and bottom wires and every other in-between wire of the fabric shall be fastened by approved ties or clips to the posts, alternating the in-between wires to be fastened on successive posts.

608.7.4-Chain Link Fence: Corner, pull, and intermediate assembly posts shall be braced in two directions, and end and gate posts shall be braced in one direction. These posts shall be braced as detailed on the Plans. # 7 gage tension wires shall be attached to both the top and the bottom of the fence fabric for the entire length of the fence.

The bottom of the fence fabric shall be placed a normal distance of 1-2 inches (38 mm) above the ground line; however, over irregular ground a minimum clearance of 1 in. (25 mm) and a maximum clearance of 6 inches (150 mm) will be permitted for a distance not to exceed 8 feet (2.4 m). Any necessary excavation and backfilling required in order to comply with these provisions shall be made as specified.

Top and bottom tension wires shall be placed and fastened to all posts before the fence fabric is placed. Tension wires shall be tautly stretched during erection. The ends of the fabric shall be secured by the use of stretcher bars threaded through the loops of the fabric and secured to corner, pull, end, gate, and intermediate assembly posts by means of clamps with bolts and nuts. The number of clamps shall be as indicated on the Plans. The fabric shall be placed by securing one end of the fabric to the stretcher bar and applying sufficient tension to remove all slack before making the attachment at the other end of the fabric. Following these attachments, the fabric shall be fastened to line and approach posts and to top and bottom tension wires with tie wires or clips. A sufficient quantity of individual fabric ties or clips shall be furnished to provide for attaching the fabric to line posts at 12 inch (300 mm) vertical spaces.

608.8-PAINTS AND PAINTING:

Zinc-coated, triple-coated and aluminum-coated metal parts in the fence structure shall not be painted. After erection is completed, all fence construction will be inspected by the Engineer. All parts of the fence and gates (including bolts and nuts) from which the coating has been abraded so that the base metal is exposed shall be spot-painted with a zinc rich primer in the case of zinc-coated and triple-coated steel and with aluminum paint in the case of aluminum-coated steel.

Wood posts and braces shall be painted when called for on the Plans.

608.9-ELECTRICAL GROUNDS: All types of fences shall be grounded where a power line passes over the fence. The ground shall be installed immediately below the point of crossing. The ground shall be accomplished with a copper clad rod, 8 ft. (2.4 m) long and $\frac{5}{8}$ in. (16 mm) (nominal) in diameter, driven vertically until the top is approximately 6 inches (150 mm) below the ground. A # 6 solid copper conductor shall be clamped to the rod and to the fence in such a manner that each element of the fence is grounded. Similar grounds shall be installed at a maximum of every 2000 ft. (600 m) length of fence, whether or not there are power line crossings. For sections of fence less than 2,000 ft. (600 m) one ground shall be provided midway between the end posts.

608.10-JUNCTIONS WITH EXISTING FENCES:

Where the right-of-way fence intersects or joins existing fence, the Contractor shall make the junction between the fences in the manner specified. An end post corresponding in strength to the type used in the right-of-way fence shall be set on the line of the existing fence and approximately 4 inches

608.11

(100 mm) outside the centerline of the highway right-of-way fence. Existing fencing fabric, or similar, shall be stretched and tied to this end post in conformance with the construction requirements for the right-of-way fence. No direct connection shall be made between the existing fence and the highway right-of-way fence. All junctions shall be made in a workmanlike manner and will be subject to the approval of the Engineer.

608.11-TEMPORARY FENCE:

Temporary fence, when called for as a separate bid item, shall be erected at locations as shown on the Plans or as directed by the Engineer.

The Contractor shall set back and re-erect existing fences, erect temporary fences from salvaged fence material, or erect Electric fences at the direction of the Engineer.

608.12-METHOD OF MEASUREMENT:

Fence will be measured by the linear foot (m). Measurement will be along the bottom wire of the fence from outside to outside of end posts for each continuous run of fence. The lengths occupied by gates will not be included in this measurement.

For farm-field fence with wood posts, the distance between posts for each intermediate assembly will be measured only once; the lap in the fencing fabric at intermediate assemblies will be included in the cost of the fence.

Temporary fence and gates, subject to the provisions specified, will be measured along the bottom of the fence from outside to outside of end posts for each continuous run of fence.

Gates, except when used when temporary fence, will be measured as complete units of the size and type specified.

608.13-BASIS OF PAYMENT:

The accepted quantities of fencing materials will be paid for at the contract unit price per linear foot (meter) for fence and per each for gates of the types and sizes specified, complete in place.

This price will include the cost of clearing, grubbing, excavating, trenching, concrete footings, backfilling, drilling in rock, grouting posts in place, painting, electrical grounds, connections to existing fences where required, furnishing all materials, labor, equipment, tools, and incidentals necessary to complete the work.

When a separate bid item for temporary fence or gate is not provided for in the Contract, there will be no compensation for constructing such a fence or gates and the cost will be included in the unit price bid for permanent right-of-way fence.

608.14-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
608001-*	"size" RIGHT-OF-WAY FENCE, CHAIN LINK	LINEAR FOOT (METER)

608002-*	"size" RIGHT-OF-WAY FENCE, FARM FIELD	LINEAR FOOT (METER)

*Sequence Number

SECTION 609 SIDEWALKS

609.1-DESCRIPTION:

This work shall consist of the construction of portland cement concrete sidewalks in accordance with these Specifications and in reasonably close conformity with the lines and grades shown on the Plans or established by the Engineer.

609.2-MATERIALS:

Materials shall meet the requirements specified in the following Subsections of Division 700:

MATERIAL	SUBSECTION
Expansion Joint Filler (Preformed)	708.1, 708.2
Joint Sealing Material	708.3

Bed Course Material: Bed course material shall consist of approved gravel, crushed stone, or crushed slag meeting the gradation requirements in 704.6.2 for Class 1 or Class 2, unless otherwise specified on the Plans.

Concrete shall be Class B conforming to the requirements of 601.

Concrete mixes will be subject to inspection and tests at the mixing plants for compliance with quality requirements.

All materials will be subject to inspection for acceptance as to condition at the latest practicable time the Engineer has the opportunity to check for compliance prior to or during incorporation of materials in the work.

CONSTRUCTION METHODS

609.3-SUBGRADE PREPARATION:

The subgrade shall be constructed true to grade and cross section as shown on the Plans or directed by the Engineer. It shall be watered, if required, and thoroughly compacted before placing the concrete or bed course material. All soft and yielding material shall be removed and replaced with suitable material.

609.4

The completed subgrade shall be tested for grade and cross section by means of a template supported on the side forms.

609.4-DRY BED:

When called for on the Plans, bed course material shall be placed on the subgrade to the depth and width specified and compacted.

609.5-FORMS:

Forms shall be of wood or metal and shall extend for the full depth of the concrete. All forms shall be straight, free from warp, and of sufficient strength to resist the pressure of the concrete without springing. Bracing and staking of forms shall be such that the forms remain in both horizontal and vertical alignment until their removal. All forms shall be cleaned and oiled before being used.

609.6-MIXING AND PLACING CONCRETE:

The foundation and surfaces not oiled shall be thoroughly moistened immediately prior to the placing of the concrete. The proportioning, mixing, and placing of the concrete shall be in accordance with the requirements for the class of concrete specified.

609.7-EXPANSION JOINTS:

Expansion joints $\frac{1}{4}$ in. (6 mm) wide shall be constructed at 30 ft. (9 m) intervals, at all returns, and opposite expansion joints in adjacent curb. A longitudinal expansion joint $\frac{1}{4}$ in. (6 mm) wide shall be placed between sidewalk and curb. Expansion joints shall be filled with preformed joint fill which shall be shaped to fit the concrete section being placed.

Where sidewalks are to be placed around or adjacent to manholes, drop inlets, or other miscellaneous structures in sidewalk areas, such structures shall not be constructed to final grade until after the sidewalk has been constructed for a reasonable distance on each side of the structure. Expansion joints, of the type specified above, shall be constructed between all such appurtenances and the sidewalk.

With the approval of the Engineer, preformed filler in longitudinal expansion joints between sidewalks and curbs may be eliminated, and the opening remaining after sidewalk has been placed shall be filled with joint sealing material.

609.8-FINISHING:

Fresh concrete shall be struck off and compacted until a layer of mortar has been brought to the surface. The surface shall be finished to grade and cross section with a float, troweled smooth, and finished with a broom. The float shall be not less than 10 feet (3 m) in length and not less than 6 inches (150 mm) in width. Brooming shall be transverse to the line of traffic, and the broom shall be kept clean.

All outside edges of the slab and all joints shall be edged with a ¼ in. (6 mm) radius edging tool.

The surface of sidewalks shall be marked into rectangles of not less than 12 sq. ft. (1 sq. m) with a scoring tool which will form dummy joints and rounded sidewalk edges. The dummy joints shall extend into the concrete ¾ in. (9 mm) depth and shall be approximately ½ in. (3 mm) wide.

The finished surface shall not vary more than ¼ in. (6 mm) from a 10 ft. (3 m) straightedge, except at grade changes, and shall be free from blemishes.

609.9-CURING:

Concrete shall be cured for at least 72 hours. Curing shall be by means of moist burlap mats, membrane curing compound, vapor barrier, or by other approved methods. During the curing period, all traffic, both pedestrian and vehicular, shall be excluded. Vehicular traffic shall be excluded for such additional time as the Engineer may direct.

609.10-METHOD OF MEASUREMENT:

Sidewalks will be measured in square yards (meters), complete in place and accepted, which will be determined by the length measured upon the surface times the width constructed, as authorized by the Engineer. Bed course material will be measured by the cubic yard (meter), complete in place and accepted. Where a driveway crosses a sidewalk, the intersecting area shall be constructed to the driveway specifications and shall not be measured for payment as sidewalk area.

609.11-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

609.12-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
609001-*	Concrete Sidewalk	SQUARE YARD (METER)
609002-*	Bed Course Material	CUBIC YARD (METER)

*Sequence number

SECTION 610

CURBS, COMBINATION CURBS AND GUTTERS AND MEDIANS

610.1-DESCRIPTION:

This work shall consist of the construction or resetting of curbs, combination curbs and gutters, and medians in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions, and locations shown on the Plans or established by the Engineer.

The types of curbing, combination curbs and gutters, or medians are as follows:

Plain Concrete Curbing
Integral Concrete Curbing
Combination Concrete Curb & Gutters
Reflecting Concrete Curbing
Asphalt Curbing
Medians

610.2-MATERIALS:

Except as provided below, materials shall meet the requirements of the following Subsections of Division 700:

MATERIAL	SUBSECTION
Reinforcing Steel	709.1, 709.4
Joint Tie Bolt Assembly	709.7
Expansion Joint Filler Preformed	708.1
Joint Sealing Material	708.3 or 708.4
PG Binder for Asphalt Curb	705.5*
Asphalt for Tack Coat	705.4 or 705.11
Asphalt Emulsion for Paint Coat	705.4 or 705.11

* Standard grade specified for local area unless indicated otherwise on the Plans.

Concrete shall meet the requirements of 601, Class B, or 501. In addition, the requirements in 610.4 shall govern when reflecting concrete curbing is called for.

Concrete, asphalt mixes, and manufactured curbing materials will be subject to inspection and tests at the plants for compliance with quality requirements.

All materials will be subject to inspection for acceptance as to condition at the latest practicable time the Engineer has the opportunity to check for compliance prior to or during incorporation of materials in the work.

Asphalt curbing component materials shall meet the applicable requirements of Section 401 and the composition of the mix shall meet the following TABLE 610.2:

TABLE 610.2 (MASTER RANGE CRITERIA)

½ in (12.5 mm)	100
3/8 in (9.5 mm)	80 - 100
# 4 (75 mm)	50 – 80
# 8 (2.36 mm)	30 – 60
# 16 (1.18 mm)	20 – 50
# 30 (600 µm)	12 - 36
# 50 (300 µm)	5 – 25
# 200 (75 µm)	3 – 9
% Asphalt	4 - 10

No mix design approval will be required for asphalt curbing, however, the Contractor shall establish a Plant Mix Formula (PMF) for asphalt content and gradation which meets the above requirements and submit it to the District for approval. The District shall review the design and submit a completed T-400 form to the Contract Administration Division, Materials Section. The Materials Section will assign a laboratory number to the design. This PMF shall also include the percentage of any additive that may be used as a stiffener for the curbing mix. If lime or other similar granular additive is used, then this material should be included in the PMF gradation. The mix shall be produced within the allowable tolerances of the following table.

610.3

PLANT MIX FORMULA	PLANT MIX TOLERANCE RANGE
Percentage Passing Sieve Sizes 3/8 in(9.5 mm), # 4 (4.75 mm)	± 7 Percentage Points
Percentage Passing Sieve # 8 (2.36 mm)	± 6 Percentage Points
Percentage Passing Sieve Sizes # 16(1.18 mm), # 30(600µm)	± 5 Percentage Points
Percentage Passing Sieve Size # 50(300µm)	± 4 Percentage Points
Percentage Passing Sieve Size # 200(75µm)	± 3 Percentage Points
Percentage of Asphalt	± 0.5 Percentage Points

The Contractor shall perform quality control sampling and testing of the asphalt curbing mix by taking a random sample once per day of production and testing for asphalt content and gradation to verify the materials composition. If testing indicates that the plant mix formula tolerances are not being met, then production shall halt until the reason for any deficiencies are determined and adjustments are made to correct these deficiencies and documented in the plant diary.

CONSTRUCTION METHODS

610.3-PLAIN CONCRETE CURBING, INTEGRAL CONCRETE CURBING, AND COMBINATION CONCRETE CURB AND GUTTER:

610.3.1-Excavation: Excavation shall be made to the required depth, and the base upon which the curb is to be set shall be compacted to a firm, even surface. All soft and unsuitable material shall be removed and replaced with suitable material which shall be thoroughly compacted. When called for on the Plans, the base upon which the curb is to be set shall be constructed of bed course material in accordance with 609.

610.3.2-Form: Forms shall be of wood or metal, straight, free from warp, and of such construction that there will be no interference with the inspection of grade or alignment. All form shall extend for the entire depth of the curb and shall be braced and secured sufficiently so that no deflection from alignment or grade will occur during the placing of the concrete. Forms shall be cleaned and oiled just prior to placing the concrete.

610.3.3-Mixing, Placing, and Finishing: Concrete shall be proportioned,

mixed, and placed in accordance with the requirements for the class of concrete specified. Concrete shall not be transported in nonagitating trucks. Compaction of concrete placed in forms shall be by vibration or other acceptable methods. Drainage openings shall be made through the curb, where indicated, or as directed by the Engineer, at the elevation and of the size required. Forms shall be left in place for 24 hours unless the concrete has set sufficiently prior to that time to permit their removal without injury to the curbing. Upon removal of the forms, the exposed curbing face shall be immediately rubbed to a uniform surface. Rubbing shall be accomplished by the use of water and a wood block or carborundum brick. For the purpose of matching adjacent concrete finishes or for other reasons, the Engineer may permit other methods of finishing. No plastering will be permitted. All damaged and rejected curb shall be removed and replaced.

610.3.4-Sections: All concrete curbing shall be constructed in sections having an approximate length of 10 ft. (3 m) unless otherwise indicated on the Plans or directed. In the construction of integral concrete curb or combination concrete curb and gutter abutting concrete pavement, the sections shall be such that the contraction and expansion joints are located opposite the contraction and expansion joints respectively in the pavement. Sections shall be separated by joints $\frac{1}{8}$ in. (3 mm) wide except at expansion joints. All joints shall be filled with joint sealing material conforming to the requirements of 708.3.

610.3.5-Expansion Joints: Expansion joints shall be formed at the intervals shown on the Plans using a preformed expansion joint filler having a thickness of $\frac{3}{4}$ inch (19 mm). When the curb is constructed adjacent to or on concrete pavement, expansion joints shall be located opposite or at expansion joint in the pavement.

610.3.6-Curing: Immediately upon completion of the rubbing, the curbing shall be moistened and kept moist for three days, or the curbing shall be cured by the use of membrane forming material. The methods and details of curing will be subject to the approval of the Engineer.

610.3.7-Backfilling: After the concrete has set sufficiently, the spaces in front and back of the curb shall be refilled to the required elevation with suitable materials, which shall be thoroughly tamped in loose layers of not more than 6 inches (150 mm).

610.3.8-Curb Machine: Where a concrete curb or curb and gutter is not required to be constructed integral with or tied to a concrete base and pavement it may be placed with a self-propelled machine consisting of a hopper and having a power driven screw or screws. The proper density and cross section shall be obtained by forcing the concrete through a mold of the specified cross section. Where a track is used, the track on which the machine operates shall be set and held to the line and grade given by the Engineer. The concrete shall

610.4

be of such consistency that it can be molded into the desired shape and will remain as placed without slumping of the vertical or sloping faces.

The consistency test may be omitted, and the yield determined from the volume required, adjusted for waste.

610.4-REFLECTING CONCRETE CURBING:

Construction methods for this item shall conform to the requirements of 610.3 with the following supplements:

The reflecting surface of the curbing shall be a mortar mix consisting of one part white portland cement to 1¾ parts of light colored, washed mortar sand. This mortar mix shall have a thickness of approximately 1 in. (25 mm).

Alternately, the entire curbing may be constructed of concrete with white portland cement. When this alternate procedure is used, it shall conform to "Placing of Concrete Curb by Separate Methods" shown on the Plans.

Washed mortar sand shall meet all the requirements for mortar sand and shall be of a light color satisfactory to the Engineer. The reflecting surface mortar shall be placed immediately after placing of the base concrete. In no case shall more than 20 minutes elapse between the placing of the base concrete and the placing of the reflecting surface.

Scoring or surface deformation of finish of the reflecting surface shall conform to the details shown on the Plans. Care shall be taken to prevent discoloration during and after construction of the curb, and, if discolored, it shall be adequately cleaned by a method approved by the Engineer.

610.5- ASPHALT CURBING:

610.5.1-Equipment & Tools: All equipment, tools, and plant machinery to be used for executing the work prescribed will be subject to the approval of the Engineer.

Asphalt curbing shall be constructed by the use of self-propelled automatic curber or curb machine or a paver with curbing attachments. This automatic curber or machine shall meet the following requirements:

- i. The weight of the machine shall be such that required compaction is obtained without the machine riding above the bed of which curbing is constructed.
- ii. The machine shall form curbing that is uniform in texture, shape, and density.

610.5.2-Excavation: Excavation, when required, shall conform to the requirements of 610.3.1.

610.5.3-Preparation of Bed: When curbing is to be constructed on a fresh laid asphalt surface, the curb shall be laid only after the surface has been cleaned.

When curbing is to be constructed on a cured or aged portland cement

concrete base, asphalt pavement, or asphalt treated base, the bed shall be thoroughly swept and cleaned by compressed air. The surface shall be thoroughly dried and, immediately prior to placing of the asphalt mixture, shall receive a tack coat of asphalt material. The rate of application of tack coat material shall be between 0.05 to 0.15 gal. per sq. yd. (0.226 to 0.679 liters per square meter) of surface. The Contractor shall prevent the spread of this tack coat to areas outside of the area to be occupied by the curb.

610.5.4-Mixing and Placing: The asphalt mixture specified in [610.2](#) shall be homogeneously mixed and shall be delivered to the hopper of the curb laying machine at a temperature of not less than 200° F (93° C) nor more than 300° F (150° C). Each hopper load of asphalt plant mix shall be run through the curb laying machine which has been adjusted to form and properly compact the asphalt curb.

The Engineer may permit the construction of curbing by means other than the automatic curber or machine when short sections or sections with short radii are required or for such other reasons as may seem to warrant it. The resulting curbing shall conform in all respects to the curbing produced by the use of the machine.

610.5.5-Joints: Unless conditions warrant, asphalt curb construction at the specified temperature shall be a continuous operation in one direction to eliminate curb joints. However, where conditions are such that this is not possible, the joints between successive days' work shall be carefully made in such a manner as to insure a continuous bond between the old and new sections of the curb. All contact surface of previously constructed curb shall be given a thin, uniform coat of hot asphalt material just prior to placing the fresh asphalt curb material.

610.5.6-Curing: The newly laid curb shall be protected from traffic by barricades or other suitable methods until the heat of the asphalt mixture has dissipated and the mixture has obtained its proper degree of hardness.

610.5.7-Painting Curb: The completed curb shall be painted with a diluted emulsified asphalt paint coat or emulsified asphalt slurry to prevent moisture absorption. The paint coat shall be prepared with a 50-50 blend of water and emulsified asphalt, grade SS-1.

610.5.8-Seasonal Limitations: No asphalt material shall be laid when the temperature of the air is 50° F (10° C) or less, or during other unfavorable weather conditions.

610.6-MEDIANS:

Medians shall be constructed to the details shown on the Plans. Construction methods shall conform to the applicable requirements in [610.3](#).

610.7

610.7-RESETTING CURB:

610.7.1-Salvage of Curbing: The Contractor shall carefully remove, store, and clean any curbing specified for resetting. The Contractor shall replace any existing curbing, specified to be reset, which is lost, damaged, or destroyed as a result of their operations or because of their failure to store and protect it in a manner that would eliminate its loss or damage.

610.7.2-Excavation: Excavation and bedding shall conform to the requirements of [610.3.1](#).

610.7.3-Placing Curb: The curb shall be set on a firm bed with the front top arris line conforming to the required line and grade. All sections of curbing shall be set so that the maximum opening between adjacent sections, for the entire exposed top and face, is not more than $\frac{1}{4}$ in. (6 mm), except that the maximum opening at expansion joints shall be not more than $\frac{3}{4}$ in. (19 mm). Any dressing of the ends of the curbing necessary to meet this requirement shall be done by the Contractor.

Expansion joints shall be filled with $\frac{3}{4}$ in. (19 mm) thick expansion joint fillers, which shall be placed concurrently with the curb.

610.7.4-Backfilling: The spaces in front and back of the curb shall be refilled to the required elevation with suitable material. This material shall be placed in loose layers of not more than 6 inches (150 mm) and thoroughly tamped.

610.7.5-Cutting and Fitting: Cutting or fitting shall be done, when necessary, in order to install the curbing at the locations directed.

610.8-METHOD OF MEASUREMENT:

Curbing will be measured by the linear foot (meter) along the front face of the section at the finished grade elevation. Combination curb and gutter will be measured by the linear foot (meter) along the face of the curb. No deduction in length will be made for drainage structures installed in the curbing. Medians will be measured in linear feet (meters) on the surface and along the centerline of the median.

Bed course material will be measured by the cubic yard (meter).

610.9-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

SECTION 611

PRECAST CONCRETE TRAFFIC DIVIDERS

611.1-DESCRIPTION:

This work shall consist of furnishing precast white portland cement concrete traffic dividers of the kind and size specified, and installing such dividers at the locations specified in accordance with the Plans and these Specifications.

611.2-MATERIALS:

Materials shall meet the requirements specified in the following Subsections of Division 700:

<u>MATERIAL</u>	<u>SUBSECTION</u>
Precast Concrete Traffic Dividers	715.20
Joint Sealer	708.3
Joint Mortar	708.8

611.3-CONSTRUCTION METHODS:

When the traffic dividers are to be placed in bituminous concrete, they shall not be placed until the bituminous concrete surface has been completed. The opening remaining between the bituminous concrete and the traffic dividers shall be filled with joint mortar or joint sealer.

When the traffic dividers are to be placed in portland cement concrete, openings into which the traffic dividers are to be set shall be formed by a method acceptable to the Engineer at the time the portland cement concrete pavement is being placed. The opening remaining between the portland cement concrete pavement and the traffic dividers shall be filled with joint mortar or

611.4

joint sealer.

After the traffic dividers are firmly set in the pavement, the lifting holes shall be filled to within ¾ in of the surface with dry sand and either sealed with joint mortar or joint sealer.

The Contractor shall keep the traffic dividers free of any material tending to deface or discolor them. Any dividers damaged shall be removed and replaced at the Contractor's expense.

611.4-METHOD OF MEASUREMENT:

The quantity of work done will be measured as the number of traffic dividers furnished and installed in place and accepted.

611.5-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for this item, which price and payment shall constitute full compensation for furnishing, preparing, and installing the traffic dividers and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, materials, equipment, supplies, and incidentals necessary to complete the work.

611.6-PAY ITEMS:

ITEM	DESCRIPTION	UNIT

SECTION 612
TUNNEL LINER PLATE PIPE

612.1-DESCRIPTION:

This work shall consist of tunneling, lining and field paving for tunnel liner plate pipe, galvanized and asphalt coated, in accordance with these specifications and in reasonably close conformity with the lines, grades, dimensions and locations shown on the Plan or established by the Engineer.

612.2-MATERIALS:

612.2.1-Liner Plates: Tunnel liner plate pipe shall have the neutral axis diameter specified on the Plans, shall be hot dipped galvanized and shall be double dipped in asphalt cement. The plates shall be of the thickness specified, punched for bolting on both longitudinal and circumferential seams, and shall be so corrugated that they have a moment of inertia of not less than that specified on the Plans. Moment of inertia shall be expressed in inches (mm) to the fourth power per inch (mm) of plate based upon the average for one ring of plates. A minimum of 10 percent of the plates shall be provided with grout

plugs for grouting the space between the excavation and the plates. Base material for tunnel liner plates shall conform to the requirements of ASTM A 569. Galvanizing of the plates shall conform to the requirements of AASHTO M 167. Plate design shall be such that complete erection of plates can be accomplished from the inside of the tunnel.

Plates shall be fabricated in accordance with the applicable detail drawings on pages 298, 300, and 301 of "Handbook of Steel Drainage and Highway Construction Products", Latest Edition, published by American Iron and Steel Institute.

612.2.2-Hardware: Bolts and nuts used with lapped seams shall be not less than $\frac{5}{8}$ inch (16 mm) in diameter. The bolts shall conform to the specifications of ASTM A 449 for plate thickness equal to or greater than 0.209 inches (5.3 mm) and ASTM A 307 for plate thickness less than 0.209 inches (5.3 mm). The nuts shall conform to ASTM A 563, grade a for A307 bolts and A563 DH for A449 bolts.

Bolts and nuts used with four flanged plates shall be not less than $\frac{1}{2}$ inch (12 mm) in diameter for plate thicknesses up to and including 0.179 inches (4.5 mm) and not less than $\frac{5}{8}$ inch (16 mm) in diameter for plates of greater thickness. The bolts and nuts shall be quick acting coarse thread and shall conform to ASTM A 307, Grade A.

Hardware shall be galvanized or cadmium plated in accordance with ASTM A 153, or ASTM B 766, CI.25 respectively.

612.2.3-Bituminous Coating: Bituminous coating shall conform to the applicable requirements of 713.3, The plates shall be fully coated.

612.2.4-Paving: Field paving shall be of Class B Concrete, conforming to the applicable requirements of 601.3.

612.2.5-Grout: Grout shall consist of portland cement and sand conforming to the requirements of 218.2 and 218.3.3, except that proportions of cement and sand may be modified to suit conditions encountered in the field.

CONSTRUCTION METHODS

612.3-GENERAL:

The Contractor shall furnish shop drawings showing a typical section of the tunnel, details of the plates, seams, size and length of bolts, and the moment of inertia of the plates in inches (mm) to the fourth power per inch (mm) of width for the ring of plates.

At all times during the construction period the work shall be under the supervision of a superintendent with a proven record of tunneling and the use of tunnel liner plates.

612.4-TUNNELING AND LINING:

612.5

Work may begin at either the outlet or inlet end. If necessary to reach the entrance grade, a shaft of minimum 8 feet (2.5 m) width and 12 feet (3.7 m) length shall be dug and the shaft sheeted and shored if necessary. Tunnel mucking shall be carried out not greater than 24 in. (600 mm) ahead of the bolting up of plates. Disposal of the removed spoil shall be in accordance with the directions of the Engineer. Mucking shall be done smoothly to fit the outside of the liner plates. The Contractor shall be responsible for adherence the line and grade, and deviations from line and grade more than 3 inches (75 mm) shall require the approval of the Engineer. If necessary, due to the type of soil encountered, jacking type shield shall be used.

At the end of each working day, the Contractor shall construct a bulkhead inside the pipe at the construction face.

612.5-GROUTING:

Grout blocks shall be installed at each end after bolting up is completed. Grouting shall start at one end and shall be carried forward until the area between the excavation and the plates is completely filled with grout. Grouting should be performed on a daily basis and progressed simultaneously with the installation of the tunnel liner plate.

612.6-FIELD PAVING:

Field paving, using portland cement concrete, shall be accomplished in accordance with the applicable requirements of [604.9](#).

612.7-METHOD OF MEASUREMENT:

The quantity of work done will be measured in linear feet (meters) of Tunnel Liner Plate Pipe, complete in place and accepted.

612.8-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid per linear foot (meter), which price and payment will be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

613-BLANK

SECTION 614 PILING WALLS

614.1 - DESCRIPTION:

This work shall consist of furnishing and placing steel piles in predrilled holes, concrete or grout, backfill and lagging, of the kinds and dimensions designated, in accordance with these provisions and in reasonably close conformity with the lines, grades, dimensions, and locations shown on the Plans or established by the Engineer. Painting of the exposed steel is included.

Careful attention shall be given to assuring the pile wall will tie directly into an existing stable slope. Prior to ordering any materials, the contractor in conjunction with the Engineer shall conduct a project site review in order to verify the limits of the pile wall.

614.2 - MATERIALS:

Materials shall conform to the requirements specified in the following Subsections of Division 700:

<u>MATERIAL</u>	<u>SUBSECTION</u>
Steel Piles and Splices	709.12
Steel Lagging and Wales	709.12
Reinforcing Steel	709.1
Prestressing Steel	709.2
Treated Timber Lagging	710
Portland Cement	701.1
Fine Aggregate	702.1
Fly Ash	707.4

614.3 - DRILLING:

614.4

A drilled hole is required for the buried length of the pile.

A minimum of 1/3 the total pile length or 10 feet (3 m), whichever is greater, is to be placed in bedrock/shale. Deviation from this requirement will be controlled by a Plan note. The total estimated pile length and the depth to the estimated bedrock/shale line are shown on the piling profile. Should the elevation of the actual bedrock/shale vary from the estimated elevation by more than 2.5 feet (0.8 m), the Engineer must approve the hole prior to placement of the pile. The material from the drilled hole shall be removed and disposed of by the Contractor in an approved site.

Particular care must be taken in the drilling operation to avoid deflecting the bit along a sloping bedrock/shale line. To verify proper alignment, the Contractor shall measure and record the vertical alignment of the hole using a plumb bob or other acceptable method.

Preferably, the diameter of the drilled hole shall be a size that will allow the pile, while being slowly lowered into the hole, to reach the bottom of the hole under the impetus of the pile weight. The minimum hole diameter shall be 2 inches (50 mm) larger than the diagonal distance across the pile cross section.

Light tapping (ten blows with at least 3 inches (75 mm) of penetration per blow) with a pile hammer exerting no more than 12,000 ft/lbs (16 kJ) of energy is permitted at the direction of the Engineer to advance the pile past minor obstacles in the hole.

Temporary casing of holes may be needed to maintain an open clean hole through the soil overburden. There will be no additional compensation for temporary casing. The cost of any casing used shall be included in the unit price bid for piling.

614.4 - INSTALLATION OF PILES:

Piles shall be located as shown on the Plans or as directed by the Engineer. Piles shall be installed with the pile center within 1 inch (25 mm) of the Plan location. The piles must be prevented from rotating, so that the pile axis is within five degrees of the position shown on the Plans.

The maximum permissible vertical deviation for piles shall be one percent of the total pile length, as measured at the actual pile location.

It is desirable that piles be installed without splicing; however, at the direction of the Engineer splices may be made. Splice lengths at the top of the piles may be butt welded provided the splice lengths are less than the required splice plates. No payment will be made for cut-offs. Welding shall be in accordance with [615.3.16](#).

Accurate records shall be maintained by the Contractor showing the depth to which each pile was placed, the plumbness, the amount of material used, elevation of bedrock/shale, and any unusual conditions encountered during the pile installation. These records shall be incorporated into the permanent records of the project.

614.5 - CORROSION PROTECTION:

Piles will be protected from corrosion and sealed by the placement of

concrete or grout, from the bottom of the hole to the bottom of the lagging or as directed by the Engineer. Vibration of the concrete or grout is not required. The Contractor shall complete all concrete or grout operations for holes drilled during the work day.

The drilled hole shall be pumped free of water and shall be reasonably free of fall-in soil or other debris prior to the placement of the concrete or grout. The concrete or grout in the bedrock/shale portion of the hole will be pumped or tremied through a pipe beginning at the bottom of the drilled hole. The pipe shall be slowly raised ensuring the pipe end remains at least 2 feet (600 mm) below the surface of the concrete or grout. A means of positively measuring the elevation of the concrete or grout as it is placed shall be provided by the Contractor.

After placing the concrete or grout in the bedrock/shale, the Contractor has the option of either pumping or pouring directly into the hole the remainder of the concrete or grout. Placing the concrete or grout from the bottom of the hole to the bottom of the lagging shall be accomplished in one continuous operation.

The Contractor will inform the Engineer, at the preconstruction conference, as to the type of corrosion protection that will be used. Intermixing of concrete and grout will not be allowed, unless approved by the Engineer.

Concrete shall be in accordance with Section 601, Class B. The job site testing is waived

Grout will be furnished and placed in accordance with the requirements specified herein.

The acceptance sampling and testing of the grout is the responsibility of the Division.

Quality Control of the concrete or grout is the responsibility of the Contractor as designated in Materials Procedure MP 601.03.50. The Contractor shall maintain equipment and qualified personnel, who shall direct all field inspection, sampling, and testing necessary to determine the magnitude of the various properties of the concrete and grout governed by the Specifications and shall maintain these properties within the limits of this Specification. The Quality Control Plan designated in MP 601.03.50 shall be submitted to the Engineer at the pre construction conference. Work shall not begin until the Plan is reviewed for conformance with the contract documents.

The required 7-day compression strength of the grout shall be a minimum of 2,000 psi (14 MPa). Grout which does not attain the 2,000 psi (14 MPa) strength in 7 days but exceeds a strength of 1,600 psi (11 MPa) shall be subject to price reduction based on the percentage of strength attained.

A grout strength test shall consist of testing three 6 in x 12 in (150 mm x 300 mm) cylindrical specimens. The test results shall be the average of the three specimens. One set of three specimens shall be made for each day's operations.

The bid price for the piling with grout compressive strengths greater than or equal to 2,000 psi (14 MPa) will be paid at 100 percent unless the piling installation does not meet Specifications for other reasons. Between 1,600 psi

614.6

(11 MPa) and 2,000 psi (14 MPa) compressive strengths, the cost of the grout will be deducted from the actual grout cost on a proportional basis with 2,000 psi (14 MPa) being 100 percent and 1,600 psi (11 MPa) being zero percent payment. With 1,600 psi (11 MPa) grout, the piling installation would be considered to meet 80 percent of the Specifications and the penalty being zero payment for the grout.

The penalty would involve only the quantity of grout represented by the failing compressive strength results.

The bid price for the piling will be reduced for the piles grouted with grout having less than 1,600 psi (11 MPa) compressive strengths as follows:

A = Compressive strength of grout

B = Total foot (meter) of piling grouted with

C = Unit bid price per foot (meter) of piling

D = Cost of grout (from Contractor)

E = 2,000 psi (14 Mpa)

F = Total penalty

$$F = D + [BC - D] 10.80 - (A + E)]$$

614.6 - PAINTING:

All surfaces from the top of the steel pile, down to and including 2.0 ft. (600 mm) below the top of the anticipated grout line shall be cleaned and painted. The method of surface preparation shall be hand tool cleaning to SSPC-SP-2. The paint system shall consist of one-coat of aluminum epoxy mastic meeting the requirements of 711.12 applied at a minimum dry film thickness of 5 mils (125 µm).

614.7 - LAGGING AND BACKFILLING:

Lagging of the type and size as specified on the Plans shall be installed between the piles. Backfilling and restoration of the roadway template shall be as shown on the Plans.

Timber lagging shall be Grade # 3 or better treated rough cut oak, 3 in (75 mm) wide by 8 in (200 mm) deep for heights up to 11 ft (3.4 m); and for wall heights exceeding 11 ft (3.4 m) the timber lagging shall be double 3 in (75 mm) wide by 8 in (200 mm) deep. The boards shall be cut to their required length prior to preservative treatment.

The timber lagging shall conform to Sections 710.3 and 710.4 of the West Virginia Division of Highways Standard Specifications and shall be CCA treated for soil and fresh water use, as per AWWA C2.

614.8 - METHOD OF MEASUREMENT:

The quantity of piles will be measured in linear feet (meters) of piles installed and accepted for the wall. The quantity of lagging will be measured in square feet (meters) of lagging installed and accepted for the wall.

614.9-BASIS OF PAYMENT:

The quantities will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all materials and doing all the work herein prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work. The cost of drilling, concrete, grout, wales, and painting shall be included in the price bid for the piles. The cost of painting and welding steel lagging shall be included in the price bid for steel lagging.

614.10-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
614001-*	"size" STEEL PILE	LINEAR FOOT (METER)
614002-*	STEEL LAGGING, THICKNESS "thickness"	SQUARE FOOT (METER)
614003-*	CONCRETE LAGGING, THICKNESS "thickness"	SQUARE FOOT (METER)
614004-*	TIMBER LAGGING	SQUARE FOOT (METER)

* Sequence number

SECTION 615

STEEL STRUCTURES

615.1-GENERAL:

615.1.1-Description: The work shall consist of furnishing, fabricating, and erecting steel structures and structural steel portions of other structures in accordance with these Specifications, the Special Provisions, and the details shown on the plans.

The structural steel fabricating plant shall be certified under the American Institute of Steel Construction (AISC) Quality Certification Program, category: "Major Steel Bridges", except fabricators of unspliced rolled beam bridges or parts for bridges such as cross frames or other miscellaneous components of larger bridges shall be certified in category: "Simple Steel Bridge Structures". The fabricators of fracture critical members shall be certified as category: "Major Steel Bridges" and, in addition, shall possess an "F" endorsement by AISC. Structural components such as expansion dams, drains, and scuppers may be fabricated in shops that are not AISC certified.

The fabricator (AISC certified or non certified) shall provide a quality control plan to the Engineer for approval. This plan shall contain information concerning the fabricator's internal control process. Information concerning the contents of the quality control plan can be found in the FHWA Region Three, Structural Committee for Economic Fabrication's Guidelines for the Development of a Quality Control Plan. The plan shall be approved by the Division prior to the start of fabrication.

Structural components designated on the plans or in the special provisions as "fracture critical" shall conform to the provisions of Section 12 of the ANSI/AASHTO/AWS Bridge Welding Code D1.5.

Painting shall conform to the provisions of Section 688.

615.1.2-Notice of Beginning of Work: The Contractor shall give the Engineer ample notice of the beginning of work at the mill or at the fabrication shop, so that inspection may be provided. The term "mill" means any rolling mill or foundry where material for the work is to be manufactured. No material shall be manufactured, or work done in the shop, before the Engineer has been so notified.

615.1.3-Inspection: Structural steel shall be inspected in the fabrication shop. The Contractor shall furnish the Engineer with a copy of all mill orders and shop lists showing heat numbers to be used for each piece. Mill test reports that document each piece. Mill the chemical analysis and physical test results for each heat of steel to be used in the work shall also be furnished. Final approval of the material in the shop will not be given until the above data is approved.

With the approval of the Engineer, certificates of compliance shall be furnished in lieu of mill test reports for material that normally is not supplied

with mill test reports, and for items such as fills, minor gusset plates and similar material when quantities are small and the material is taken from stock.

Certified mill test reports for steels with specified minimum impact values shall include, in addition to other test results, the results of Charpy V-Notch impact tests. When fine grain practice is specified, the test report shall confirm that the material was so produced. Copies of mill orders shall be furnished at the time orders are placed with the manufacturer. Certified mill test reports and Certificates of Compliance shall be furnished prior to the start of fabrication of material covered by these reports. The Certificate of Compliance shall be signed by the manufacturer and shall certify that the material is in conformance with the specifications to which it has been manufactured.

Material to be used shall be made available to the Engineer so that each piece can be examined. The Engineer shall have free access at all times to any portion of the fabrication shop where the material is stored or where work on the material is being performed.

615.1.4-Inspector's Authority: The Inspector shall have the authority to reject materials or workmanship which do not fulfill the requirements of these Specifications. In cases of dispute, the Contractor may appeal to the Engineer, whose decision shall be final.

Inspection at the shop is intended as a means of facilitating the work and avoiding error, and it is expressly understood that it will not relieve the Contractor of any responsibility in regard to defective material or workmanship and the necessity for replacing same.

The acceptance of any material or finished members by the Inspector shall not be a bar to their subsequent rejection, if found defective. Rejected materials and workmanship shall be replaced as soon as practical or corrected by the Contractor.

615.2-WORKING DRAWINGS:

The Contractor shall expressly understand that the Engineer's approval of the working drawings submitted by the Contractor covers the requirements for "strength and detail," and that the Engineer assumes no responsibility for errors in dimensions.

Working drawings must be approved by the Engineer prior to performance of the work involved and such approval shall not relieve the Contractor of any responsibility under the contract for the successful completion of the work.

615.2.2-Erection Drawings: The Contractor shall submit drawings illustrating fully their proposed method of erection. The drawings shall show details of all falsework bents, bracings, guys, dead-men, lifting devices, and attachments to the bridge members: sequence of erection, location of cranes and barges, crane capacities, location of lifting points on the bridge members, and weights of the members. The plan and drawings shall be complete in detail for all anticipated phases and conditions during erection. Design calculations, sealed by a West Virginia Registered Professional Engineer, shall be submitted

615.2.3

by the Contractor to the Engineer for approval which will demonstrate that allowable stresses for falsework and steel members being erected are not exceeded and that member capacities and final geometry shall be correct.

When the designated concrete deck overhang exceeds 2.5 feet (750 mm), the erection drawings submitted by the Contractor shall include complete details of the forming and bracing for the overhang and shall transmit the concrete dead load to an area of the girder which will prevent distortion of the web or distortion of the beam. All forming and bracing procedures are subject to approval of the Engineer.

615.2.3-Camber Diagram: A camber diagram shall be furnished to the Engineer by the Fabricator, showing the camber at each panel point in the cases of trusses or arch ribs, and at the location of field splices and fractions of span length ($\frac{1}{4}$ points minimum) in the cases of continuous beam and girders or rigid frames. The camber diagram shall shown calculated cambers to be used in preassembly of the structure in accordance with Section 615.5.3.

615.3-MATERIALS:

615.3.1-Structural Steel:

615.3.1.1-General: Steel shall be furnished according to the following specifications. The grade or grades of steel to be furnished shall be as shown on the plans or as specified. If not so shown or specified, structural carbon steel shall be furnished. When copper bearing steel is specified, the steel shall contain not less than 0.2 percent copper.

All steel for use in main load-carrying member components subject to tensile stress, including splice plates, shall conform to Zone 2 Charpy V-Notch Impact Test requirements of AASHTO M270.

Any additional materials required but not listed below shall comply with Division 700.

615.3.1.2-Carbon Steel: Unless otherwise specified, structural carbon steel for bolted or welded construction shall conform to [709.12](#).

615.3.1.3-High-Strength Low-Alloy Structural Steel: Shall conform to [709.8](#).

615.3.2-High-Strength Fasteners: Bolts, nuts, and washers shall conform to [709.24](#) and shall be either mechanically galvanized or coated with zinc rich primer. Hot-dip galvanizing may be used only when specified by the Contract documents.

615.3.3-Welded Stud Shear Connectors: When design requires the use of welded stud shear connectors, they shall meet the requirements of Section 7 of the ANSI/AASHTO/AWS D1.5, Bridge Welding Code.

615.3.4-Steel Forgings and Steel Shafting:

615.3.4.1-Steel Forgings: Shall conform to 709.13.1.

615.3.4.2-Cold Finished Carbon Steel Shafting: Shall conform to 709.13.2.

615.3.5-Steel Castings: Shall conform to 709.14.

615.3.6-Iron Castings: Shall conform to 709.10.

615.3.7-Coating of Anchor Bolts, Nuts and Washers: All anchor bolts, nuts and washers shall be hot dip galvanized in accordance with AASHTO M111 after fabrication.

615.4-FABRICATION:

615.4.1-Identification of Steels During Fabrication: The Contractor's system of assembly-marking individual pieces, and the issuance of cutting instructions to the shop (generally by cross-referencing of the assembling item covered on the mill purchase order) shall be such as to maintain identity of the original piece.

The Contractor may furnish from stock, material that can be identified by heat number and mill test report.

During fabrication, up to the point of assembling members, each piece of steel, other than Grade 36 steel, shall show clearly and legibly its specification. This may be done by writing the material grade on the piece or using the identification color code shown in Table 615.4.

TABLE 615.4 IDENTIFICATION COLOR CODES	
Grade 50	Green & Yellow
Grade 50W	Blue & Yellow
Grade 70W	Blue & Orange
Grade 100	Red
Grade 100W	Red & Orange

Other steels, except Grade 36 steel, not covered above, nor included in the AASHTO M160 Specification, shall have an individual colorcode which shall be established and kept on record for the Engineer.

Pieces of steel, other than Grade 36 steel, which prior to assembling into members, will be subject to fabricating operations, such as blast cleaning, galvanizing, heat forming, or painting which might remove or cover paint color

615.4.2

code markings, shall be marked for grade by steel die stamping or by a substantial tag firmly attached. Steel die stamps shall be low stress-type.

Upon request, the Contractor shall furnish an affidavit certifying that throughout the fabrication operation the identification of steel has been maintained in accordance with this specification.

615.4.2-Storage of Materials: Structural material, either plain or fabricated, shall be stored above the ground on platforms, skids, or other supports. It shall be kept free from dirt, grease, and other foreign matter, and shall be protected as far as practicable from corrosion.

615.4.3-Plates:

615.4.3.1-Direction of Rolling: Unless otherwise shown on the plans, steel plates for main members and splice plates for flanges and main tension members, not secondary members, shall be cut and fabricated so that the primary direction of rolling is parallel to the direction of the main tensile and/or compressive stresses.

615.4.3.2-Plate Cut Edges:

615.4.3.2.1-Edge Planing: Sheared edges of plate more than $\frac{5}{8}$ inch (16 mm) in thickness and carrying calculated stress shall be planed, milled, ground, or thermal cut to a depth of $\frac{1}{4}$ inch (6 mm).

615.4.3.2.2-Thermal Cutting: Shall conform to the requirements of the ANSI/AASHTO/AWS Bridge Welding Code D1.5.

615.4.3.2.3-Visual Inspection and Repair of Plate Cut Edges: Shall conform to the requirements of ANSI/AASHTO/AWS Bridge Welding code D1.5.

615.4.3.3-Bent Plates:

615.4.3.3.1-General: Unwelded, load-carrying, rolled-steel plates to be bent shall conform to the following:

They shall be so taken from the stock plates that the bend line will be at right angles to the direction of rolling, except that cold-bent ribs for orthotropic-deck bridges may be bent with bend lines in the direction of rolling if permitted by the Engineer.

Before bending, the corners of the plates shall be rounded to a radius of approximately $\frac{1}{16}$ inch (2 mm) throughout the portion of the plate at which the bending is to occur.

615.4.3.3.2-Cold Bending: Cold bending shall be such that no cracking of the plate occurs. Minimum bend radii, measured to the concave face of the metal, are shown in table 615.4.3.3.2.

Table 615.4.3.3.2-Minimum Bend Radii

Thickness in Inches (millimeters) (t)	Up to ½" (12 mm)	Over ½" to 1" (12 to 25 mm)	Over 1" to 1½" (25 to 38 mm)	Over 1½" to 2½" (38 to 64 mm)	Over 2½" to 4" (64 to 100 mm)
Bend radii for all grades of structural steel in this specification	2t	2½t	3t	3½t	4t

Allowance for springback of Grades 100 and 100W steels should be about three times that for Grade 36 steel. For break press forming, the lower die span should be at least 16 times the plate thickness. Multiple hits are advisable.

615.4.3.3.3-Hot Bending: If a radius shorter than the minimum specified for cold bending is essential, the plates shall be bent hot at a temperature not greater than shown in Table 615.4.7.

615.4.4-Fit of Stiffeners: Bearing stiffeners for girders and stiffeners intended as supports for concentrated loads shall have full bearing (either milled, ground or on weldable steel in compression areas of flanges, welded when shown on the plans or specified) on the flanges to which they transmit load or from which they receive load and shall meet the requirements of paragraph 3.5 of the ANS/AASHTO/AWS Bridge Welding Code D1.5. Intermediate stiffeners not intended to support concentrated loads, unless shown or specified otherwise, shall have a tight fit against both flanges. Diaphragm, crossframes or floorbeam connection plates shall be welded to both top and bottom flanges.

615.4.5-Abutting Joints: When specified by the contract plans, butting joints in compression members of trusses and columns shall be milled or saw-cut to give a square joint and uniform bearing. At other joints, not required to be faced, the opening shall not exceed ⅜ inch (10 mm).

615.4.6-Facing of Bearing Surfaces: The surface finish of bearing and base plates and other bearing surfaces that are to come in contact with each other or with concrete shall meet the ANSI surface roughness requirements as defined in ANSI B46.1, Surface Roughness, Waviness and Lay, Part I:

Steel slabs	ANSI 2,000
Heavy plates in contact in shoes to be welded	ANSI 1,000
Milled ends of compression members, milled or ground ends of stiffeners and fillers	ANSI 500
Bridge rollers and rockers	ANSI 250

615.4.7

Pins and pin holes

ANSI 125

Sliding bearings

ANSI 125

615.4.7-Straightening Material: The straightening of plates, angles, other shapes, and built-up members, when permitted by the Engineer, shall be done by methods that will not produce fracture or other injury to the metal. Distorted members shall be straightened by mechanical means or, if approved by the Engineer, by carefully planned procedures and supervised application of a limited amount of localized heat, except that heat straightening of Grades 70W, 100 and 100W steel members shall be done only under rigidly controlled procedures, each application subject to the approval of the Engineer. In no case shall the maximum temperature exceed values shown in Table 615.4.7.

Table 615.4.7-Maximum Heat Straightening And Hot Bending Temperature {ENGLISH}	
Grade 70W > 6" from weld	1,075° F
Grade 70W < 6" from weld	900° F
Grade 100 or 100W > 6" from weld	1,125° F
Grade 100 or 100W < 6" from weld	950° F

Table 615.4.7-Maximum Heat Straightening And Hot Bending Temperature (METRIC)	
Grade 480W > 150 mm from weld	580 °C
Grade 480W < 150 mm from weld	480 °C
Grade 690 or 690W > 150 mm from weld	610 °C
Grade 690 or 690W < 150 mm from weld	590 °C

In all other steels, the temperature of the heated area shall not exceed 1,200° F (650° c) as controlled by temperature indicating crayons, liquids, or bimetal thermometers.

Parts to be heat straightened shall be substantially free of stress and from external forces, except stresses resulting from mechanical means used in conjunction with the application of heat.

Evidence of fracture following straightening of a bend or buckle will be cause for rejection of the damaged piece.

615.4.8-Bolt Holes:

615.4.8.1-Holes for High-Strength Bolts and Unfinished Bolts: (See

Section 615.5.5 for bolts included in designation "Unfinished Bolts").

615.4.8.1.1-General: All holes for bolts shall be either punched or drilled. Material forming parts of a member composed of not more than five thicknesses of metal may be punched 1/16 inch (2 mm) larger than the nominal diameter of the bolts whenever the thickness of the material is not greater than 3/4 inch (20 mm) for structural carbon steel, 5/8 inch (16 mm) for high-strength steel or 1/2 inch (12 mm) for quenched and tempered alloy steel, unless subpunching and reaming are required under Section 615.4.8.5.

When there are more than five thicknesses or when any of the main material is thicker than 3/4 inch (20 mm) for structural carbon steel, 5/8 inch (16 mm) for high-strength steel, or 1/2 inch (12 mm) for quenched and tempered alloy steel, all holes shall either be subdrilled and reamed or drilled full size.

When required, all holes shall be either subpunched or subdrilled (subdrilled if thickness limitation governs) 3/16 inch (5 mm) smaller and, after assembling reamed 1/16 inch (2 mm) larger or drilled full size to 1/16 inch (2 mm) larger than the nominal diameter of the bolts.

When shown on the plans, enlarged or slotted holes are allowed with high-strength bolts.

615.4.8.1.2-Punched Holes: The diameter of the die shall not exceed the diameter of the punch by more than 1/16 inch (2 mm). If any holes must be enlarged to admit the bolts, such holes shall be reamed. Holes must be clean cut without torn or ragged edges.

615.4.8.1.3-Reamed or Drilled Holes: Shall be cylindrical, perpendicular to the member, and shall comply with the requirements of Section 615.4.8.1.1 as to size. Where practical, reamers shall be directed by mechanical means. Burrs on the outside surfaces shall be removed. Reaming and drilling shall be done with twist drills, twist reamers or rotobroach cutters. Connecting parts requiring reamed or drilled holes shall be assembled and securely held while being reamed or drilled and shall be match marked before disassembling. Parts shall not be held by welding.

615.4.8.1.4-Accuracy of Holes: Holes not more than 1/32 inch (1 mm) larger in diameter than the true decimal equivalent of the nominal diameter that may result from a drill or reamer of the nominal diameter are considered acceptable. The slightly conical hole that naturally results from punching operations is considered acceptable. The width of slotted holes which are produced by thermal cutting or a combination of drilling or punching and thermal cutting shall be not more than 1/32 inch (1 mm) greater than the nominal width. The thermal cut surface shall be ground smooth.

615.4.8.2-Accuracy of Hole Group:

615.4.8.2.1-Accuracy Before Reaming: All holes punched full size,

615.4.8.2

subpunched, or subdrilled shall be so accurately punched so that after assembling (before any reaming is done) a cylindrical pin $\frac{1}{8}$ inch (3 mm) smaller in diameter than the nominal size of the punched hole may be entered perpendicular to the face of the member, without drifting, in at least 75 percent of the contiguous holes in the same plane. If the requirement is not fulfilled, the improperly punched pieces will be rejected. If any hole will not pass a pin $\frac{3}{16}$ inch (5 mm) smaller in diameter than the nominal size of the punched hole, this will be cause for rejection.

615.4.8.2.2-Accuracy after Reaming: When holes are reamed or drilled, 85 percent of the holes in any contiguous group shall, after reaming or drilling, show no offset greater than $\frac{1}{32}$ inch (1 mm) between adjacent thickness of metal.

All steel templates shall have hardened steel bushings in holes accurately dimensioned from the centerlines of the connection as inscribed on the template. The centerlines shall be used in locating accurately the template from the milled or scribed ends of the members.

615.4.8.3-Numerically-Controlled Drilled Field Connections: In lieu of subsized holes and reaming while assembled, or drilling holes full-size while assembled, the Contractor shall have the option to drill or punch bolt holes full-size in unassembled pieces and/or connections including templates for use with matching subsized and reamed holes by means of suitable numerically controlled (N/C) drilling or punching equipment. Full-size punched holes shall meet the requirements of Section 615.4.8.1.

If N/C drilling or punching equipment is used, the Contractor, by means of check assemblies, will be required to demonstrate the accuracy of this drilling or punching procedure in accordance with the provisions of Section 615.5.3.3.

Holes drilled or punched by N/C equipment shall be drilled or punched to appropriate size either through individual pieces, or drilled through any combination of pieces held tightly together. Pieces shall not be held by welding.

615.4.8.4-Holes for Ribbed Bolts, Turned Bolts, or Other Approved Bearing Type Bolts: All holes for ribbed bolts, turned bolts, or other approved bearing-type bolts shall be subpunched or subdrilled $\frac{3}{16}$ inch (5 mm) smaller than the nominal diameter of the bolt and reamed when assembled, or drilled to a steel template or, after assembling, drilled from the solid at the option of the Fabricator. In any case the finished holes shall provide a driving fit.

615.4.8.5-Preparation of Field Connections: Holes in all field connections and field splices of main members of trusses, arches, continuous beam spans, bents, towers (each face), plate girders, and rigid frames shall be subpunched or subdrilled and subsequently reamed while assembled or drilled

full size to a steel template. Holes for field splices of rolled beam stringers continuous over floor beams or cross frames may be drilled full size unassembled to a steel template. All holes for floor beams or cross frames may be drilled full size unassembled to a steel template. All holes for floor beam and stringer field end connections shall be subpunched and reamed while assembled or drilled full size to a steel template. Reaming or drilling full size of field connection holes through a steel template shall be done after the template has been located with utmost care as to position and angle and firmly bolted in place. Templates used for reaming matching members, or the opposite faces of a single member, shall be exact duplicates. Templates used for connections on like parts or members shall be so accurately located that the parts or members are duplicates and require no match-marking.

For any connection, in lieu of subpunching and reaming or subdrilling and reaming, the fabricator may, at his option, drill holes full size with all thicknesses or material assembled in proper position.

615.4.9-Pins and Rollers:

615.4.9.1-General: Pins and rollers shall be accurately turned to the dimensions shown on the drawings and shall be straight, smooth, and free from flaws. Pins and rollers more than 9 inches (225 mm) in diameter shall be forged rollers and annealed. Pins and rollers 9 inches (225 mm) or less in diameter may be either forged and annealed or cold-finished carbon-steel shafting.

In pins larger than 9 inches (225 mm) in diameter, a hole not less than 2 inches in (50 mm) diameter shall be bored full length along the axis after the forging has been allowed to cool to a temperature below the critical range, under suitable conditions to prevent damage by too rapid cooling, and before being annealed.

615.4.9.2-Boring Pin Holes: Pin holes shall be bored true to the specified diameter, smooth and straight, at right angles with the axis of the member and parallel with each other unless otherwise required. The final surface shall be produced by a finishing cut.

The diameter of the pin hole shall not exceed that of the pin by more than 1/50 inch (500 μ m) for pins 5 inches (125 mm) or less in diameter, or by 1/32 inch (1 mm) for larger pins.

The distance outside to outside of end holes in tension members and inside to inside of end holes in compression members shall not vary from that specified more than 1/32 inch (1 mm). Boring of pin holes in built-up members shall be done after the member has been assembled.

615.4.9.3-Threads for Bolts and Pins: Threads for all bolts and pins for structural steel construction shall conform to the Unified Standard Series UNC ANSI B1.1, Class 2A for external threads and Class 2B for internal threads, except that pin ends having a diameter of 1 3/8 inches (36 mm) or more shall be threaded six threads to the inch (25 mm).

615.4.10

615.4.10-Eyebars: Pin holes may be thermal cut at least 2 inches (50 mm) smaller in diameter than the finished pin diameter. All eyebars that are to be placed side by side in the structure shall be securely fastened together in the order that they will be placed on the pin and bored at both ends while so clamped. Eyebars shall be packed and match-marked for shipment and erection. All identifying marks shall be stamped with steel stencils on the edge of one head of each member after fabrication is completed so as to be visible when the bars are nested in place on the structure. Steel die stamps shall be low stress type.

The eyebars shall be straight and free from twists and the pin holes shall be accurately located on the centerline of the bar. The inclination of any bar to the plane of the truss shall not 0.5 percent.

The edges of eyebars that lie between the transverse centerline of their pin holes shall be cut simultaneously with two mechanically operated torches abreast of each other, guided by a substantial template, in such a manner as to prevent distortion of the plates.

615.4.11-Annealing and Stress Relieving: Structural members which are indicated in the contract to be annealed or normalized shall have finished machining, boring, and straightening done subsequent to heat treatment. Normalizing and annealing (full annealing) shall be as defined in ASTM E44. The temperatures shall be maintained uniformly throughout the furnace during the heating and cooling so that the temperature at no two points on the member will differ by more than 100° F (38° C) at any one time.

Members of Grades 100/100W or Grade 70W (690/690W or Grade 480W) steels shall not be annealed or normalized and shall be stress relieved only with the approval of the Engineer.

A record of each furnace charge shall identify the pieces in the charge and show the temperatures and schedule actually used. Proper instruments, including recording pyrometers, shall be provided for determining at any time the temperatures of members in the furnace. The records of the treatment operation shall be available to and meet the approval of the Engineer. The holding temperature for stress relieving Grades 100/100W and Grade 70W (690/690W and Grade 480W) steels shall not exceed 1,125° F and 1,075° F (610 °C and 580 °C), respectively.

Members, such as bridge shoes, pedestals, or other parts that are built up by welding sections of plate together shall be stress relieved in accordance with the ANSI/AASHTO/AWS Bridge Welding Code D1.5 when required by the plans, specifications, or special provisions governing the contract.

615.4.12-Curved Girders:

615.4.12.1-General: Flanges of curved, welded girders may be cut to the radii shown on the plans or curved by applying heat as specified in the succeeding Sections providing the radii is not less than allowed by Article

10.15.2 of Division I of the AASHTO Standard Specifications for Highway Bridges.

615.4.12.2-Heat Curving Rolled Beams and Welded Girders:

615.4.12.2.1-Materials: Steels that are manufactured to a specified minimum yield point greater than 50,000 psi (345 Mpa) shall not be heat curved.

615.4.12.2.2-Type of Heating: Beams and girders may be curved by either continuous or V-type heating as approved by the Engineer. For the continuous method, a strip or intermittent strips along the edge of the top and bottom flange shall be heated simultaneously depending on flange widths and thicknesses; the strip shall be of sufficient width and temperature to obtain the required curvature. For V-type heating, the top and bottom flanges shall be heated in truncated triangular or wedge-shaped areas having their base along the flange edge and spaced at regular intervals along each flange; the spacing and temperature shall be as required to obtain the required curvature, and heating shall progress along the top and bottom flange at approximately the same rate.

For V-type heating, the apex of the truncated triangular area applied to the inside flange surface shall terminate just before the juncture of the web and the flange is reached. To avoid unnecessary web distortion, special care shall be taken when heating the inside flange surfaces (the surfaces that intersect the web) so that heat is not applied directly to the web. When the radius of curvature is 1,000 feet (300 m) or more, the apex of the truncated triangular heating pattern applied to the outside flange surface shall extend to the juncture of the flange and web. When the radius of curvature is less than 1,000 feet (300 m), the apex of the truncated triangle heating pattern applied to the outside flange surface shall extend past the web for a distance equal to one-eighth of the flange or 3 inches (75 mm), whichever is less. The truncated triangular pattern shall have an included angle of approximately 15 to 30 degrees, but the base of the triangle shall not exceed 10 inches (250 mm). Variations in the patterns prescribed above may be made with the approval of the Engineer.

For both types of heating, the flange edges to be heated are those that will be on the inside of the horizontal curve after cooling. Heating both inside and outside flange surfaces is only mandatory when the flange thickness is $1\frac{1}{4}$ inches (32 mm) or greater, in which case, the two surfaces shall be heated concurrently. The maximum temperature shall be prescribed as follows.

615.4.12.2.3-Temperature: The heat-curving operation shall be conducted in such a manner that the temperature of the steel does not exceed 1,150° F (620° C) as measured by temperature indicating crayons or other suitable means. The girder shall not be artificially cooled until after naturally cooling to 600° F (315° C). The method of artificial cooling is subject to the approval of the Engineer.

615.4.12

615.4.12.2.4-Position for Heating: The girder may be heat-curved with the web in either a vertical or a horizontal position. When curved in the vertical position, the girder must be braced or supported in such a manner that the tendency of the girder to deflect laterally during the heat-curving process will not cause the girder to overturn.

When curved in the horizontal position, the girder must be supported near its ends and at intermediate points, if required, to obtain a uniform curvature; the bending stress in the flanges due to the dead weight of the girder must not exceed the usual allowable design stress. When the girder is positioned horizontally for heating, intermediate safety catch blocks must be maintained at the mid-length of the girder within 2 inches (50 mm) of the flanges at all times during the heating process to guard against a sudden sag due to plastic flange buckling.

615.4.12.2.5-Sequence of Operations: The girder shall be heat-curved in the fabrication shop before it is painted. The heat curving operation may be conducted either before or after all the required welding of transverse intermediate stiffeners is completed. However, unless provisions are made for girder shrinkage, connection plates and bearing stiffeners shall be located and attached after heat curving. If longitudinal stiffeners are required, they shall be heat-curved or oxygen-cut separately and then welded to the curved girder. When cover plates are to be attached to rolled beams, they may be attached before heat curving if the total thickness of one flange and cover plate is less than 2½ inches (37.5 mm) and the radius of the curvature is greater than 1,000 feet (30 meters). For other rolled beams with cover plates, the beams must be heat-curved before the cover plates are attached; cover plates must be either heat curved or oxygen-cut separately and then welded to the curved beam.

615.4.12.2.6-Camber: Girders shall be cambered before heat curving. Camber for rolled beams may be obtained by heat-cambering methods approved by the Engineer. For plate girders, the web shall be cut to the prescribed camber with suitable allowance for shrinkage due to cutting, welding, and heat curving. However, subject to the approval of the Engineer, moderate deviations from specified camber may be corrected by a carefully supervised application of heat.

615.4.12.2.7-Measurement of Curvature and Camber: Horizontal curvature and vertical camber shall be measured for final acceptance after all welding and heating operations are completed and the flanges have cooled to a uniform temperature. Horizontal curvature shall be checked with the girder in the vertical position.

615.4.13-Blank

615.4.14-Full Size Tests: When full size tests of fabricated structural members or eyebars are required by the contract, the Contractor shall provide

615.5.3.1

suitable facilities, material, supervision, and labor necessary for making and recording the required tests. The members tested in accordance with the contract shall be paid for in accordance with Section 615.7.2.

615.4.15-Marking and Shipping: Each member shall be painted or marked with an erection mark for identification and an erection diagram showing these marks shall be furnished to the Engineer.

The Contractor shall furnish to the Engineer as many copies of material orders, shipping statements, and erection diagrams as the Engineer may direct.

The weights of the individual members shall be shown on the statements. Members weighing more than 3 tons (2.75 Mg) shall have the weights marked thereon. Structural members shall be loaded on trucks or railcars in such a manner that they may be transported and unloaded at their destination without being excessively stressed, deformed, or otherwise damaged.

High strength bolts, nuts, and washers shall be packaged as required by Section 709.24.9.1. Pins and small parts shall be shipped in boxes, crates, kegs, or barrels, but the gross weight of any package shall not exceed 300 pounds (136 kg). A list and description of the contained material shall be plainly marked on the outside of each shipping container.

615.5-ASSEMBLY:

615.5.1-Bolting: Surfaces of metal in contact shall be clean before assembling. The parts of a member shall be assembled, well pinned, and firmly drawn together before drilling, reaming, or bolting is commenced. Assembled pieces shall be taken apart for the removal of burrs and shavings produced by the operation. The member shall be free from twists, bends and other deformation.

The drifting done during assembling shall be only such as to bring the parts into position and not sufficient to enlarge the holes or distort the metal.

615.5.2-Welded Connections: Surfaces and edges to be welded shall be smooth, uniform, clean and free of defects which would adversely affect the quality of the weld. Edge preparation shall be done in accordance with ANSI/AASHTO/AWS Bridge Welding Code D1.5.

615.5.3-Preassembly of Field Connections:

615.5.3.1-General: Field connections of main members of trusses, arches, continuous beams, plate girders, bents, towers and rigid frames shall be preassembled prior to erection to verify the geometry of the completed structure or unit and to verify or prepare field splices. Attaining accurate geometry is the responsibility of the Contractor and he shall propose an appropriate method of preassembly for approval by the Engineer. The method and details of preassembly shall be consistent with the erection procedure shown on the erection plans and camber diagrams prepared by the Contractor and approved by the Engineer. As a minimum, the preassembly procedure shall consist of

615.5.3.2

assembling three contiguous panels accurately adjusted for line and camber.

Successive assemblies shall consist of at least one section or panel of the previous assembly (repositioned if necessary and adequately pinned to assure accurate alignment) plus two or more sections or panels added at the advancing end. In the case of structures longer than 150 feet (45 meters), each assembly shall be not less than 150 feet (45 meters) long regardless of the length of individual continuous panels or sections. At the option of the fabricator, sequence of assembly may start from any location in the structure and proceed in one or both directions so long as the preceding requirements are satisfied.

615.5.3.2-Bolted Connections: For bolted connections, holes shall be prepared as outlined in Section 615.4.8. Where specified by the contract documents, major components shall be assembled with milled ends of compression members in full bearing and then shall have theirsub-sized holes reamed to the specified size while the connections are assembled.

615.5.3.3-Check Assembly-Numerically Controlled Drilling: When the Contractor elects to use numerically controlled drilling, a check assembly shall be required for each major structural type, unless otherwise designated on the plans or in the special provisions, and shall consist of at least three contiguous shop sections or, in a truss, all members in at least three contiguous panels but not less than the number of panels associated with three contiguous chord lengths (i.e., length between field splices). Check assemblies should be based on the proposed order of erection, joints in bearing, special complex points, and similar considerations. Special points could be the portals of skewed trusses, for example. More than one check assembly may be required by the Engineer.

The check assemblies shall include the first sections of each major structural type to be fabricated and additional assemblies as required by the Engineer.

Shop assemblies other than the check assemblies will not be required.

If the check assembly fails in some specific manner to demonstrate that the required accuracy is being obtained, further check assemblies may be required by the Engineer for which there shall be no additional cost to the Division.

615.5.3.4-Field Welded Connections: For field welded connections the fit of members including the proper space between abutting surfaces shall be prepared and verified with the segment preassembled in accordance with Section 615.5.3.1.

615.5.3.5-Assembly Verification: Each assembly, including camber, alignment, accuracy of holes, and fit of milled or field welded joints, shall be approved by the Engineer before reaming or drilling is commenced or before an N/C drilled check assembly or field welded assembly is dismantled.

615.5.4-Match Marking: Connecting parts preassembled in the shop to assure proper fit in the field shall be match-marked, and a diagram showing such marks shall be furnished to the Engineer.

615.5.5-Connections Using Unfinished, Turned or Ribbed Bolts:

615.5.5.1-General: When unfinished bolts are specified, the bolts shall be unfinished, turned, or ribbed bolts, conforming to the requirements of Grade A Bolts of the Specification for Low-Carbon Steel Externally and Internally Threaded Standard Fasteners, ASTM A 307. Bolts shall have single self-locking nuts or double nuts unless otherwise shown on the plans or in the Special Provisions. Beveled washers shall be used where bearing faces have a slope of more than 1:20 with respect to a plane normal to the bolt axis. The requirements of this Section do not pertain to the use of high-strength bolts. Bolted connections using high-strength bolts shall conform to Section 615.5.6.

615.5.5.2-Turned Bolts: The surface of the body of turned bolts shall meet the ANSI roughness rating value of 125. Heads and nuts shall be hexagonal with standard dimensions for bolts of the nominal size specified or the next larger nominal size. Diameter of threads shall be equal to the body of the bolt or the nominal diameter of the bolt specified. Holes for turned bolts shall be carefully reamed with bolts furnished to provide for a tight driving fit. Threads shall be entirely outside of the holes. A washer shall be provided under the nut.

615.5.5.3-Ribbed Bolts: The body of ribbed bolts shall be of an approved form with continuous longitudinal ribs. The diameter of the body measured on a circle through the points of the ribs shall be 5/64 inch (2 mm) greater than the nominal diameter specified for the bolts.

Ribbed bolts shall be furnished with round heads conforming to ANSI B 18.5 unless otherwise specified. Nuts shall be hexagonal, either recessed or with a washer of suitable thickness. Ribbed bolts shall make a driving fit with the holes. The hardness of the ribs shall be such that the ribs do not mash down enough to permit the bolts to turn in the holes during tightening. If for any reason the bolt twists before drawing tight, the hole shall be carefully reamed and an oversized bolt used as a replacement.

615.5.6-Connections Using High-Strength Bolts:

615.5.6.1-General: This specification covers the assembly of structural connections using high-strength bolts and nuts with hardened washers where initial tension in the bolt produces friction on the contact surfaces of the connected pieces sufficient in magnitude to resist shear.

615.5.6.2-Bolted Parts: Surfaces of bolted parts in contact with the bolt head and nut shall not have a slope of more than 1 to 20 with respect to a plane normal to the bolt axis. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible material. Holes may be punched, subpunched, reamed or drilled and shall be of nominal diameter not more than 1/16 inch (2 mm) in excess of the nominal

615.5.6.3

bolt diameter.

When assembled, all joint surfaces, including those adjacent to the washers, shall be free of dirt, oil, loose scale, burrs, pits, and other defects that would prevent solid seating of the parts. All bolted surfaces shall be painted in accordance with Section 688, Painting Steel Structures.

615.5.6.3 - Installation: Fasteners shall be protected from dirt and moisture at the job site. Only the fasteners anticipated to be installed and tightened during a work shift shall be removed from protected storage. Fasteners not used shall be returned to protected storage at the end of the shift. Lot identification of all components shall be maintained at all times. Galvanized and zinc coated nuts shall be checked to verify that a visible lubricant is on the threads and nut faces. Fasteners shall not be cleaned of lubricant that is present in the delivered condition. Where galvanized fasteners must be tensioned by turning the bolt head, a visible lubricant that meets the requirements of AASHTO M 164, shall be applied to the washer that will be placed under the bolt head. The lubricant may be applied to the washer by the manufacturer prior to shipment, by the fabricator at the fabrication shop, or by the erector in the field. Fasteners which have accumulated rust, dirt or have been wet, shall be cleaned and relubricated, prior to installation. Bolt, nut and washer combinations as installed shall be from the same rotational-capacity lot.

A tension measuring device and torque wrench, suitable to the Engineer, shall be provided and maintained by the Contractor at all job sites where high-strength fasteners are being installed. The tension measuring device shall be used to confirm: (1) the suitability to satisfy the requirement of Table 615.5.6.3 A of the completed fastener assembly, including lubricant, to be used in the work, (2) rotational capacity testing requirements, and (3) that the bolting crew understands proper installation procedures. The tension measuring device and torque wrench shall be calibrated by an approved testing agency at least yearly. Documentation of calibration shall be provided to the Engineer.

Immediately prior to installation in the fabrication shop or on the project site, all high-strength fasteners shall be subjected to rotational-capacity testing by the fabricator or the contractor. Testing shall be in accordance with Section 709.24.5 and shall be conducted at a frequency of two assemblies per rotational-capacity lot number as identified on the shipping containers. Test results shall meet the requirements of Section 709.24.5. When fasteners have been cleaned and relubricated, the rotational-capacity testing, on the affected fasteners, shall be reconducted. The Engineer may request additional tests as necessary to provide assurance of product compliance.

Bolts shall be installed with a hardened washer under the nut or bolt head, whichever is the element turned in tightening. A flat washer may be used when the abutting surface adjacent to the bolt head or nut does not have a slope of more than 1 to 20 with respect to a plane normal to the bolt axis, a smooth beveled washer shall be used to compensate for the lack of parallelism.

The threaded end of bolts shall be placed on the inside, where practicable, to protect them from the weather.

615.5.6.3

All fasteners shall be tightened to give at least the required minimum bolt tension shown in Table 615.5.6.3 A on completion of the joint. Tightening shall be done by the TURN-OF-NUT METHOD.

TABLE 615.5.6.3 A-FASTENER TENSION (ENGLISH)	
Bolt Size (inches)	Required Minimum Fastener Tension (kips)
$\frac{1}{2}$	12
$\frac{5}{8}$	19
$\frac{3}{4}$	28
$\frac{7}{8}$	39
1	51
$1\frac{1}{8}$	56
$1\frac{1}{4}$	71
$1\frac{3}{8}$	85
$1\frac{1}{2}$	103

615.5.6.3

TABLE 615.5.6.3 A-FASTENER TENSION (METRIC)	
Bolt Size (mm)	Required Minimum Fastener Tension (kN)
M16	91
M20	142
M22	176
M24	205
M27	276
M30	326
M36	475

Impact wrenches shall be of adequate capacity and sufficiently supplied with air to perform the required tightening in approximately 10 seconds. Tightening may be done by turning the bolt while the nut is prevented from rotating when it is impractical to turn the nut.

A representative sample of not less than three bolt, nut and washer assemblies of each diameter, length, and grade to be used in the work shall be checked at the start of work, by the contractor, in a device capable of indicating bolt tension. The test shall demonstrate that the method for estimating snug tight condition, and controlling the turns from snug tight to be used by the bolting crew will develop a tension at least 5 percent greater than the tension required by Table 615.5.6.3 A. All additional fasteners (bolts, nuts, and washers) necessary for inspection and testing shall be provided by the Contractor as required by Section 105.5.

Bolts shall be installed in all holes of the connection and brought to "snug tight" condition. Snug tight is defined as that tightness which exists when the plies of the joint are in firm contact and a tension is induced in the bolts of approximately 40-50 percent of the required tension specified in Table 615.5.6.3 A.

Snug tightening shall progress systematically from the most rigid part of the connection to the free edge, and then the bolts of the connection shall be again retightened to snug tight in a similar systematic manner until all bolts are simultaneously snug tight and the connection is fully compacted. Following this initial operation, all bolts in the connection shall be tightened further by the applicable amount of rotation in Table 615.5.6.3 B. During the tightening operation, there shall be no rotation of the part not turned by the wrench. Tightening shall progress systematically from the most rigid part of the joint to its free edges.

TABLE 615.5.6.3 B NUT ROTATION FROM SNUG TIGHT CONDITION ^{a, b}			
	DISPCISION OF OUTER FACES OF BOLTED PARTS		
Bolt Length in Diameters (measured from underside of head to end of bolt)	Both faces normal to bolt axis	One face normal to bolt axis other face sloped not more than 1:20 (bevel washers not used)	Both faces sloped not more than 1:20 from normal to bolt axis (bevel washers not used)
Up to & including 4	1/3 turn	½ turn	2/3 turn
Over 4 but not exceeding 8	½ turn	2/3 turn	5/6 turn
Over 8 but not exceeding 12 ^c	2/3 turn	5/6 turn	1 turn

- Nut rotation is relative to bolt, regardless of the element (nut or bolt) being turned. For bolts installed by ½ turn and less, the tolerance shall be plus or minus 30 degrees; for bolts installed by 2/3 turn and more, the tolerance shall be plus or minus 45 degrees.
- Applicable only to connections in which all material within the grip of the bolt is steel.
- No research or testing has been performed to establish the TURN-OF-NUT procedure for bolt lengths exceeding 12 diameters. Therefore, the required rotation must be determined by the Contractor by actual test in a suitable tension measuring device which simulates conditions of solidly fitted steel. Testing is subject to approval by the Engineer.

615.5.6.4 - Inspection: The Engineer will determine the following requirements are met in the work.

Before the installation of fasteners in the work, the Engineer will check the markings, lot identifications, surface condition and lubrication, storage of all bolts, nuts and washers and the faying surfaces of joints for compliance with requirements of Sections 615.3.2, 615.5.6.2, 615.5.6.3 and 709.24.9. The

615.5.7

Engineer will observe calibration and testing procedures required in Section 615.5.6.3 to confirm the procedure is properly used and, when so used with the fastener assemblies supplied, the tensions specified in Table 615.5.6.3 A are provided. The Engineer will observe the installation of fasteners in the work to assure the procedure, as demonstrated in the initial testing to provide specified tension, is routinely properly applied. Bolts installed by the turn-of-nut method may reach tensions substantially above the values given in Table 615.5.6.3 A, but this shall not be cause for rejection.

615.5.7-Welding: Fabrication of welded members, welding, welder qualifications, prequalification of weld details and inspection of welds shall conform to the requirements of the ANSI/AASHTO/AWS Bridge Welding Code D1.5. Ultrasonic testing (UT) may be used for nondestructive testing of butt welded joints in lieu of radiographic testing (RT) at the Contractor's option.

Brackets, clips, shipping devices or other material not required by the plans or Special Provisions shall not be welded or tacked to any member unless shown on the shop drawings and approved by the Engineer.

All of the above requirements apply equally to both shop and field welding operations.

615.6-ERECTION:

615.6.1-General: The Contractor shall provide all tools, machinery, and equipment necessary to erect the structure. The Contractor shall prepare and submit to the Engineer for approval, plans for falsework or for changes in the existing structure necessary for maintaining traffic. The falsework shall be properly designed and substantially constructed and maintained for the loads which will come upon it (see 615.2.2). Approval of the Contractor's plans shall not be considered as relieving the Contractor of any responsibility. In addition to the above, the Contractor's West Virginia Registered Professional Engineer shall certify to the Engineer that the falsework system has been assembled according to the approved falsework drawings, prior to placing loads on the falsework.

615.6.2-Handling and Storing Materials: Material to be stored at the job site shall be placed on skids above the ground. It shall be kept clean and properly drained. Girders and beams shall be placed upright and shored. Long members, such as columns and chords, shall be supported on skids placed near enough together to prevent damage from deflection. If the contract is for erection only, the Contractor shall check the material against the shipping lists and report promptly in writing any shortage or damaged discovered. The Contractor shall be responsible for the loss of any material while in their care, or for any damage caused to it after being received by the Contractor.

615.6.3-Bearings and Anchorage's: Masonry bearing plates shall not be

placed upon bridge-seat bearings which are improperly finished, deformed, or irregular. Bearing plates shall be set level in exact position and shall have a full and even bearing upon the masonry. Preformed fabric pads, of the thickness shown on the Plans, shall be placed between the bearings and the masonry. The preformed fabric pads or other material when specified, shall be included in the price bid for structural steel.

The Contractor shall drill the holes and set the anchor bolts, except where the bolts are built into the masonry. The bolts shall be set accurately and fixed with portland cement grout completely filling the holes. The location of anchor bolts in relation to the slotted holes in the expansion shoes shall correspond with the temperature at the time of erection. The nuts or anchor bolts at the expansion ends of spans shall be adjusted to permit the free movement of the span.

615.6.4-Erection Procedure:

615.6.4.1-Conformance to Drawings: The erection procedure shall conform to the erection drawings submitted in accordance with Section 615.2.2. Any modifications to or deviations from this erection procedure shall require revised drawings and verification of stresses and geometry by the Contractor's registered West Virginia Professional Engineer. The proposed revisions shall be approved by a West Virginia Registered Professional Engineer.

615.6.4.2-Erection Stresses: Any erection stresses that are induced in the structure as a result of the use of a method of erection or equipment which differs from that shown on the plans or specified, and which will remain in the finished structure as locked-in stresses shall be accounted for by the Contractor. The Contractor may provide additional material at their expense to keep both temporary and final stresses within the allowable limits used in design.

The Contractor will be responsible for providing temporary bracing or stiffening devices to accommodate handling stresses in individual members or segments of the structure during erection.

615.6.4.3-Maintaining Alignment and Camber: During erection the Contractor will be responsible for supporting segments of the structure in a manner that will produce the proper alignment and camber in the completed structure. Cross frames and diagonal bracing shall be installed as necessary during the erection process to provide stability and assure correct geometry. Temporary bracing, if necessary at any stage of erection, shall be provided by the Contractor.

615.6.5-Field Assembly: The parts shall be accurately assembled as shown on the plans or erection drawings, and any match-marks shall be followed. The material shall be carefully handled so that no parts will be bent, broken, or otherwise damaged. Hammering which will damage or distort the members

615.6.6

shall not be done. Bearing surfaces and surfaces to be in permanent contact shall be cleaned before the members are assembled. Splices and field connections shall have all holes filled with high strength bolts before snug tightening begins. Snug tightening and final tightening shall be in accordance with Section 615.5.6.3.

Fitting-up bolts may be the same high-strength bolts used in the installation provided all requirements of Section 615.5.6 are strictly adhered to. If other fitting-up bolts are used they shall be of the same nominal diameter as the high-strength bolts, and cylindrical erection pins shall be 1/32 inch (1 mm) larger.

615.6.6-Pin Connections: Pilot and driving nuts shall be used in driving pins. They shall be furnished by the Contractor without charge. Pins shall be so driven that the members will take full bearing. Pin nuts shall be screwed up tight and the threads burred at the face of the nut with a pointed tool.

615.6.7-Misfits: The correction of minor misfits involving minor amounts of reaming will be considered a legitimate part of the erection. However, any error in the shop fabrication or deformation resulting from handling and transporting will be cause for rejection.

The Contractor shall be responsible for all misfits, errors, and damage and shall make the necessary corrections and replacements. The Engineer's approval shall be obtained by the Contractor before any reaming of holes or other corrections are undertaken.

615.6.8-Removal of Falsework and Cleaning Up of Site: Upon completion of the erection and before final acceptance, the Contractor shall remove all falsework, excavated or useless materials, rubbish, and temporary buildings, shall restore, in an acceptable manner, all property which may have been damaged during the prosecution of the work, and shall leave the structure site and adjacent highway in a neat and presentable condition, satisfactory to the Engineer. All falsework or other obstructions placed in stream beds shall be removed by the Contractor.

615.7-MEASUREMENT AND PAYMENT:

615.7.1-General: Structural steel will be measured on a lump sum basis or on a pound (kilogram) basis, as required by the terms of the Contract, but it will be on a lump sum basis unless stipulated otherwise on the Plans.

Under contracts containing an item for structural steel, all metal parts, other than metal reinforcement for concrete, such as anchor bolts, nuts, shoes, rockers, rollers, bearing, and slab plate, pins and nuts, bolts embedded in concrete cradles and brackets, railing and railing posts, waterstops, preformed fabric or other type of bearing pads, and roadway drainage system when this material is connected to the metal work, will be paid for as structural steel unless otherwise noted, stipulated, or listed as separate pay items.

Steel grid flooring will be measured and paid for as structural steel only if noted on the Plans.

615.7.2-Lump Sum Contracts: In the case of a lump sum bid, it shall be the Contractor's responsibility to determine the weight on which he bases his bid, for the weight of structural steel shown on the Plans is approximate only. In the event of discrepancy between the Plan weight and the actual weight, no increase or decrease in the Contract lump sum price bid for the item will be made on account of such discrepancy.

615.7.3-Pound Price Contracts:

615.7.3.1-General: The payment in pound-price contracts will be based on the computed net weight of metal in the fabricated and erected structures, or on certified scale weights when so specified on the Plans. The weight of temporary erection bolts, drift pins, shop and field paint, boxes, crates and other containers used for shipping, and materials used for supporting members during transportation and erection will not be included.

615.7.3.2-Computed Weights Net: The weight of the metal work to be paid for under the Contract for structural steel will be computed on the following basis:

	UNIT WEIGHTS PER CUBIC FOOT	UNIT KG PER CUBIC METER
Aluminum cast or wrought	173.0	2772
Bronze, cast	536.0	8586
Copper-alloy	536.0	8586
Copper sheet	558.0	8938
Iron, cast	445.0	7128
Iron, malleable	470.0	7529
Iron, wrought	487.0	7801
Lead, sheet	707.0	11 325
Steel: rolled, cast, copper bearing, silicon, nickel and stainless	490.0	7849
Zinc	450.0	7208

- ii. The weights of rolled shapes will be computed on the basis of their nominal weights per foot (meter) as shown on the drawings or listed in the handbooks. The weights of plates will be computed on the basis of the nominal weight of the width and thickness as shown on the drawings, plus an estimated overrun computed as one-half of the "Permissible Variation in Thickness and Weight" as tabulated in

615.7.3.2

AASHTO M160.

- iii. The weights of castings will be computed from the dimensions shown on the approved shop drawings, deducting for open holes. To this weight will be added five percent allowance for fillets and overrun. Scale weights may be substituted for computed weights in the case of castings or of small complex parts for which accurate computations of weight would be difficult.
- iv. For members comprising both carbon steel and other special steel or material, when separate unit prices are provided for such members, the weight of each class of steel in each such member will be separately computed and paid for at the Contract unit price.
- v. In computing pay weight on the basis of computed net weight, the following additional stipulations will apply:

The weight of all high-strength bolt heads, nuts, single washers and thread stick-throughs, both field and shop, will be included on the basis of Table 615.7.3.2.

TABLE 615.7.3.2 (ENGLISH)	
Nominal Diameter of High-Strength Bolt in Inches	WEIGHT PER 100 UNITS IN LB
	Bolt Head, Nut, One Washer and Stick-Through
$\frac{1}{2}$	22
$\frac{5}{8}$	33
$\frac{3}{4}$	55
$\frac{7}{8}$	84
1	120
$1\frac{1}{8}$	169
$1\frac{1}{4}$	216

TABLE 615.7.3.2 (METRIC)

SECTION 616 – BLANK

SECTION 617

RAILINGS

617.1-DESCRIPTION:

This work shall consist of furnishing, constructing, and erecting a pipe railing or other fabricated metal railing of the type specified, on a bridge, wall, or other structure, in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions, and sections shown on the Plans.

617.2-MATERIALS:

Materials shall conform to the applicable requirements of Division 700.

All ferrous pipe used for railing shall be wrought iron, and fittings for pipe railing shall be in accordance with the requirements for malleable iron castings in 709.10.

Caulking compounds, for use on surfaces where aluminum is in contact with other metal except stainless steel, shall be as approved by the Engineer.

Elastomeric bearing pads shall conform to the requirements of 715.15.

Mortar for grouting anchor bolts shall be of the following proportion by weight: one part nonshrink aggregate, one part silica sand (702.1), and one part Type I cement (701.1).

CONSTRUCTION METHODS

617.3-LINE AND GRADE:

The line and grade of railing shall conform to that shown on the Plans and not follow any unevenness in the structure. All railing posts shall be vertical.

617.4-PIPE RAILING:

Pipe railing shall be built in accordance with details shown on the Plans.

617.5-FERROUS METAL RAILING:

617.5.1-Fabrication and Erection: Fabrication and erection of ferrous metal railing shall be done in accordance with the applicable requirements of 615. In the case of welded railing, all exposed joints shall be finished by grinding or filing, after welding, to provide a neat appearance.

Railings shall be carefully adjusted prior to fixing in place to insure proper matching at abutting joints and correct alignment and camber throughout their length. The railing shall be so fabricated as to allow for minor adjustments in both horizontal and vertical directions. In the bottom of the sealed end, a ½ in. (12 mm) hole for drainage shall be provided.

617.5.2-Painting: Ferrous metal railing shall be given one shop coat of paint and two coats of paint after erection. Painting shall conform to the

requirements for painting metal structures in 615. No painting is required on railing or posts where galvanizing is specified on the Plans.

617.6-ALUMINUM RAILING:

617.6.1-Fabrication and Erection: Post base castings shall be accurately set and the bolts tightened to obtain full bearing on the base. Additional aluminum shims shall be furnished to permit adjustment in the field to assure compliance with the grade and alignment shown on the Plans.

Material ½ in. (12 mm) thick or less may be sheared, sawed, or milled. Material over ½ in. (12 mm) thick shall be sawed or milled. Cut edges shall be true, smooth, and free from excessive burrs or ragged breaks. Reentrant cuts shall be filleted by drilling prior to cutting. Flame cutting will not be permitted. Welding will not be permitted except as specifically called for in the Contract.

Rivet or bolt holes shall be drilled or subpunched 3/16 in. (4 mm) smaller than the nominal diameter of the fastener and reamed to size. The finished diameter of holes shall not be more than seven percent greater than nominal diameter of the fasteners. Anchor bolt holes and slotted bolt holes to take care of expansion shall be provided as called for on the Plans.

617.6.2-Protection: Where aluminum alloys, except anchor bolts, come in contact with materials other than aluminum and stainless steel, the surfaces in contact shall be protected as follows:

- i. The contact surfaces shall be thoroughly coated with a suitable caulking compound when in contact with other metals except stainless steel.
- ii. Elastomeric bearing pads shall be placed under each post. The pad shall cover the entire contact area between the post and concrete and shall be neatly trimmed to the shape of the post base. The pads shall meet the requirements of Section 715.15.

617.6.3-Finishing: After the concreting has been completed, the aluminum bridge railing shall be thoroughly cleaned, removing any accumulation of oil, grease, dirt, or other foreign materials. An approved solvent cleaner may be used. Where mechanical means are used to remove stains, grease, minor scratches, etc., the resulting finish shall be uniform in appearance over the entire tube. Tubing for a single structure shall present the same uniform finish at time of final acceptance.

Finished tubing shall be free from grease and stains, gouges, dents and burrs, and shall have a minimum of rubs, scratches, and minor extrusion marks from the dies.

617.7-GROUTING OF ANCHOR BOLTS:

Where anchor bolts for railing brackets or posts on concrete are not cast-in-place during the original pour, they shall be grouted in place with mortar as specified in 617.2

617.8-METHOD OF MEASUREMENT:

The quantities of work done will be measured by the linear foot (meter) of "Pipe Railing", "Ferrous Metal Railing", or "Aluminum Railing", as the case may be, complete in place and accepted, which will be determined by the overall length as shown on the Plans, or as authorized by the Engineer. When metal railing is used with concrete posts, the pay length for the railing will be the sum of all the net lengths between posts.

Reinforcing steel required in concrete posts for "Ferrous Metal Railing" will be measured and paid for as provided in 602.

Concrete posts for "ferrous Metal Railing" will be measured and paid for as provided in 601.

617.9-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work described in a workmanlike and acceptable manner, including all the labor, tools, equipment, supplies, and incidentals necessary to complete the work.

SECTION 618
CAST BRONZE AND ROLLED COPPER-ALLOY
EXPANSION PLATES

618.1-DESCRIPTION:

This work shall consist of furnishing and erecting cast bronze or rolled copper-alloy expansion plates, to be used as friction type expansion or bearing plates, in accordance with the details and dimensions shown on the Plans and in accordance with this Specification.

618.2-MATERIALS:

Materials shall conform to the requirements specified in the following Subsections of Division 700:

<u>MATERIAL</u>	<u>SUBSECTION</u>
Bronze Castings for expansion Plates	709.18
Rolled Copper-Alloy Expansion Plates	709.19

CONSTRUCTION METHODS

618.3-GENERAL:

Plates shall be accurately set in position as shown on the Plans and shall have a uniform bearing over the entire area. Provisions shall be made to keep the plates in position while masonry is being placed. When finishing is indicated on the Plans or directed, the surfaces shall comply with the American Standards Association surface roughness requirements as defined in ASA B46, 1-55, ASA 125.

618.4-CAST BRONZE PLATES:

Cast bronze plates shall be cast according to details shown on the Plans. Sliding surfaces shall be planed parallel to the movement of the span and polished unless otherwise detailed.

When self-lubricated bronze plates are specified, they shall conform to 709.18 unless otherwise provided. They shall be trepanned in a geometric pattern of recesses to receive a lubricating material suitable for long-life service of the bearing face. The lubricated area shall comprise a minimum of 25 percent of the bearing face to provide a coefficient of friction for bronze on steel of approximately 10 percent for loads of 1,000 to 2,000psi. (7 to 14 MPa). Only the sliding surfaces shall be lubricated.

618.5-ROLLED COPPER-ALLOY EXPANSION PLATES:

Rolled copper-alloy expansion plates shall be furnished according to the details shown on the Plans. Finishing of rolled plates will not be required if they have a plane true and smooth surface. If finishing is indicated on the Plans or directed, it shall be in the direction of the movement of the span.

618.6-METHOD OF MEASUREMENT:

The quantity of work done will be measured by the pound (kilogram). Unless otherwise provided, the weight to be paid for shall be the certified scale weight in pounds (kilograms) of the plates placed in the structure but not to exceed the weight as computed from the net dimensions shown on the Plans. The weight per cubic foot of cast bronze or copper-alloy plates shall be considered as 536 lb. (8.6 Mg per cubic meter).

618.7-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments

618.8

shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all materials, labor, tools, equipment, supplies, and incidentals necessary to complete the work.

618.8-PAY ITEMS:

SECTION 619
WATERPROOFING

619.1-DESCRIPTION:

This work shall consist of waterproofing concrete retaining walls, abutments, earth-filled arches, and concrete decks, either in the form of dampproofing (primers with bituminous paint coat) or membrane waterproofing (primers with bituminous membrane fabric, with or without protection course) as specified on the Plans. Dampproofing shall consist of a primer and two coats of bituminous materials. Membrane waterproofing shall consist of a primer, two layers of fabric, and three moppings of hot bituminous material. The work shall be done in accordance with the Specifications and as shown on the Plans.

619.2-MATERIALS:

The materials shall conform to the requirement of the several Subsections of Division 700 of these Specifications as follows:

MATERIAL	SUBSECTION	TYPE
Dampproofing Primer	705.4, 705.11 or 705.8	SS-1 or SS-1h CSS-1 or CSS-1h
Dampproofing Agent	705.4, 705.11 705.7	SS-1 or SS-1h CSS-1 or CSS-1h
Membrane Waterproofing	705.8	
Membrane Waterproofing	705.7	
Waterproofing Fabric	715.8	
Reinforcing Steel	709.3	
Hot-Poured Elastic Type Concrete Joint Sealer	708.3	

When the dampproofing agent is SS-1, the primer shall be SS-1 to which shall be added a maximum of 15 percent water by weight.

Membrane fabric shall be stored in a dry, protected place. The rolls shall not be stored on end.

CONSTRUCTION METHODS

619.3-PREPARATION OF SURFACE:

Before applying the primer coat, all rod holes and other voids shall be pointed, and all projections, loose material, and excess dust shall be removed from the surface.

When emulsion is used, the surface may be damp.

When asphalt is used, the surface shall be thoroughly dry. Should the surface be damp, it shall be covered with a 2 in. (150 mm) layer of hot sand which shall be allowed to remain for two hours, after which it shall be swept back, uncovering sufficient surface for beginning of work, and the operation repeated as the work progresses. For surfaces too steep to hold sand, other satisfactory methods to produce a dry surface shall be used. No waterproofing shall be done in wet weather or when the temperature is below 35° F (2° C), without written authority of the Engineer.

619.4-DAMPPROOFING:

The entire surface to be dampproofed shall be covered with the required primer by use of a mop. After this primer has been allowed to cure, two successive moppings with an asphalt cement or asphalt emulsion shall be applied. All coats shall be of uniform thickness throughout, and the total bituminous material used shall be not less than 11 gal. per 100 sq. ft. (4.5 liters per square meter) of surface. Each coat shall be allowed to dry thoroughly before the following coat is applied.

Before dampproofing is started, all construction joints shall be waterproofed in accordance with 619.5, with fabric membranes 24 in. (600 mm) wide for the full length of the joint.

619.5-MEMBRANE WATERPROOFING:

The asphalt primer shall be heated to a temperature between 100 and 125° F (38° C and 52° C), with frequent stirring to avoid local overheating. The asphalt for waterproofing shall be heated to a temperature between 300 and 350° F (150° C and 175° C), with frequent stirring to avoid local overheating. The heating kettles shall be equipped with thermometers.

In all cases, the waterproofing shall begin at the low point of the surface to be waterproofed so that water will run over and not against or along the laps.

The first strip of fabric shall be of half width, the second shall be of full width, lapped the full width of the first sheet, and the third and each succeeding strip shall be the full width and lapped so that there will be two layers of fabric at all points with three-layer lap for a distance not less than 2 inches (50 mm). All

two-layer end laps shall be at least 12 in. (300 mm).

The procedure for applying primer and waterproofing with membrane fabric shall be as follows:

- i. Beginning at the low point of the surface to be waterproofed, the entire surface shall be mopped with a primer of cutback asphalt and allowed to cure.
- ii. A section slightly more than half the width of the membrane fabric and for the full length of the surface shall be mopped with an asphalt cement and a half width of the fabric pressed into place.
- iii. The half width of fabric and an adjacent section of the surface equal to slightly more than half the width of the fabric shall be mopped with an asphalt cement and a full width of fabric pressed into place, completely covering the first strip.
- iv. Slightly more than half of this second strip and an adjacent section of the concrete surface equal to slightly more than half the width of the fabric shall be mopped with an asphalt cement, and the third strip of fabric shingled on so as to lap the first strip more than 2 inches (50 mm). This process shall be continued until the entire surface is covered with two layers of fabric.
- v. The entire surface shall then be given a final mopping with an asphalt cement.

The completed waterproofing shall be firmly bonded membrane composed of two layers of fabric and three moppings of asphalt, together with a coating of primer. Under no circumstances shall one layer of fabric touch another layer at any point, or touch the surface of the structure, unless separated from that layer or surface by one coat of asphalt.

On horizontal surfaces, not less than 13 gal. of asphalt shall have been used for each 100 sq. ft. (5 liters of asphalt shall have been used for each square meter) of finished work; and on vertical surfaces, not less than 16 gal. (6.5 liters) shall have been used. The work shall be so regulated that at the close of a day's work all fabric that is laid shall have received the final mopping of asphalt. Special care shall be taken at all laps to see that they are thoroughly sealed.

619.6-DETAILS:

At the edges of the membrane and at any point where it is punctured by drain, pipes, etc., suitable provisions shall be made to prevent water from getting between the waterproofing and the surface waterproofed. All flashing at curbs and against girders, spandrel walls, etc., shall be done with separate sheets lapping the main membrane not less than 12 in. (300 mm). Flashing shall be closely sealed either with a metal counter flashing or by embedding the upper edges of the flashing in a groove poured full of joint sealing material.

Joints which are essentially open joints, but which are not designed to provide for expansion, shall first be caulked with oakum and lead wool and then filled with hot joint sealing material.

Expansion joints, both horizontal and vertical, shall be provided with sheet copper in "U" or "V" form, in accordance with the details shown on the plans, and shall be filled with hot joint filler sealing material. The membrane shall be carried continuously across all expansion or construction joints. At the ends of the structure, the membrane shall be carried well down on the abutments and suitable provision made for all movement.

Care shall be taken to prevent injury to the finished membrane by the passage over it of men, wheelbarrows, etc., or by throwing any material on it. Any damage which may occur shall be repaired by patching. The first layer of the membrane patch shall extend at least 12 in. (300 mm) beyond the outermost damaged portion, and the second ply shall extend at least 3 inches (75 mm) beyond the first ply.

619.7- PROTECTION COURSE:

Over the waterproofing membrane constructed as specified above, there shall be placed a protection course which shall be 3 inches (75 mm) of Class A concrete. This concrete shall be reinforced midway between its top and bottom surface with wire mesh having six inch (150 mm) openings each direction and using size # W 1.4 wire. The construction of the protection course shall immediately follow the waterproofing operations and shall conform to the applicable requirements of 601.

619.8-METHOD OF MEASUREMENT:

The quantities of work done will be measured in square yards (meters) of "Dampproofing", "Membrane Waterproofing without Protection Course", or "Membrane Waterproofing with Protection Course", as the case may be, complete in place and accented, determined from actual measurement of the work.

619.9-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

619.10-PAY ITEMS:

620-BLANK

SECTION 621

STEEL GRID FLOORING

621.1-DESCRIPTION:

Steel grid flooring shall be of the open type or concrete filled type as shown on the Plans. The floor shall meet the requirements for the design of steel grid floors of the current issue of AASHTO Standard Specifications for Highway Bridges. Before fabrication or construction is undertaken, the Contractor shall submit complete shop and assembly details to the Engineer for approval, and no work shall be done until written approval of such details has been received.

621.2-MATERIALS:

621.2.1-Steel: All steel except as noted below shall conform to the requirements of ASTM A 36 and shall have a copper content of not less than 0.2 percent. Form strips used in concrete filled grid floors shall conform to the requirements of ASTM A 569.

621.2.2-Concrete: All concrete in filled steel grid floors shall conform to the requirements for Class A Concrete as specified in 601.

CONSTRUCTION METHODS

621.3-ARRANGEMENT OF SECTIONS:

All steel shall be straight and true to line and shall be assembled in a workmanlike manner.

Where the main elements are transverse to the centerline of roadway, the units generally shall be of such length as to extend over the full width of the roadway for roadways up to 40 ft. (12 meters), but in no case shall the units extend over less than four supports. Where joints are required, the ends of the main elements shall be welded at the joints over their full cross sectional area or otherwise connected to provide full continuity.

Where the main elements are parallel to the centerline of roadway, the sections shall be as long as practicable, but in no case shall the units extend over less than four supports. The ends of the abutting units shall be welded over their full cross sectional area or otherwise connected to provide full continuity in accordance with the design.

621.4-PROVISION OF CAMBER:

Provisions for camber shall be made as follows:

Rigid units that will not readily follow the roadway camber or the roadway crown, as the case may be, shall be cambered in the shop.

Longitudinal stringers shall be mill cambered or provided with varying

thickness bearing bars along their centerlines so that the completed floor, after dead load deflection, shall conform to the camber shown on the Plans.

Transverse stringers shall be mill cambered or provided with varying thickness bearing bars along their centerlines so that the completed floor shall conform to the crown shown on the Plans. These stringers shall also be placed normal to the crown of the roadway to provide even bearings for the grid sections.

Where bars are used, the design span length of the grid shall be governed by the width of the bar.

621.5-FIELD ASSEMBLY:

Areas of considerable size shall be assembled before the floor is welded to its supports. The main elements shall be made continuous, and sections shall be connected together along their edges by welding of bars or by other methods meeting with the approval of the Engineer.

621.6-CONNECTION TO SUPPORTS:

The floor shall be connected to its steel supports by welding. Provisions shall be made to provide bearing of all sections on the supporting members by shimming or added weldment. The location, length, and size of welds shall be as per the Manufacturer's recommendations or as shown on the Plans.

The ends of all the main steel members of the slab shall be securely fastened together at the sides of the roadway for the full length of the span by means of steel plates or angles welded to the ends of the main elements or by thoroughly encasing the ends with concrete where the main members are parallel to traffic; suitable side trim shall be used connecting the cross members.

621.7-WELDING:

All shop and field welding shall be done in accordance with [615.5.7](#).

Surfaces to be welded shall be free from paint, grease, loose scale, rust and other material that will prevent a proper weld. A thin coating of linseed oil, without pigment, need not be removed. Any clinkers or slag resulting from flame cutting or other causes shall be removed before welding.

621.8-CONCRETE FILLER:

Floor types with bottom flanges not in contact shall be provided with bottom forms of sheet metal to retain the concrete filler without excessive leakage. These strips shall fit tightly on the bottom flanges of the floor members but shall extend a minimum distance on the flanges in order that there shall be adequate bearing area of the slab on the support.

The concrete shall be Class A, mixed, placed, and cured in accordance with the requirements outlined in [601](#). The concrete shall be thoroughly compacted by vibrating the steel grid floor in a manner satisfactory to the Engineer.

621.9-PAINTING:

All painting shall conform to the provisions in section [688](#). The paint

621.10

system shall be specified in the contract documents.

621.10-METHOD OF MEASUREMENT:

Steel grid flooring will be measured by the number of square feet (meters) complete in place, not including Class A concrete. The volume of Class A Concrete will be computed on the basis of a slab equal to the thickness of the steel grid flooring as called for on the Plans, minus the volume of metal in the steel grid flooring. The volume of metal will be determined from the weight of the steel grid flooring as listed by the fabricator. The cost of construction of roadway drains, scuppers, downspouts, etc., where specified, shall be included in the price bid for Class A Concrete. The expansion devices will be included in the item of structural steel.

621.11-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which price and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work; except that Class A concrete will be paid for under Item 601001-*.

621.12-PAY ITEMS:

SECTION 622
TIMBER BRIDGE STRUCTURES

622.1 - GENERAL:

622.1.1 - This work shall consist of the fabrication and erection or fabrication and delivery of timber bridge structures in accordance with these specifications and in reasonably close conformity with the lines, grades, dimensions and locations shown on the Plans. All work shall be done and all materials shall meet the requirements of this specification and plan notes.

622.1.2 - These specifications apply to the following types of timber bridge structures:

Type A: Longitudinal Stress-Laminated Plank Deck

The superstructure is formed by longitudinal vertical sawn lumber laminations which are clamped together on their wide faces by high-strength steel stressing thread bars through holes in the laminations. Stressing pressure is transferred to the timber by bearing plates located along the outer laminations at the edge of the deck and develops sufficient friction between the laminations

to cause them to perform structurally as a unit.

Type B: Cellular Structural Glued-Laminated Beams With Longitudinal Stress-Laminated Plank Deck

The superstructure is formed by longitudinal glued-laminated beams which are stress-laminated into two layers of longitudinal vertical sawn lumber laminations. One layer of vertical lumber is at the top surface of the glued-laminated beam and forms the deck. The second layer is at the bottom surface of the beam. The resulting cross-section is a closed cell box beam configuration.

Type C: Structural Glued-Laminated Beams With Longitudinal Stress-Laminated Plank Deck

The superstructure is a Tee cross-section formed by longitudinal glued-laminated beams which are stress-laminated with a layer of vertical sawn lumber to form the deck.

Type D: Structural Glued-Laminated Beams With Transverse Glued-Laminated Deck Panels

The superstructure consists of longitudinal glued-laminated beams with a non-composite transverse glued-laminated deck panels over the beams.

Type E: Structural Glued-Laminated Longitudinal Deck Panels With Transverse Glued-Laminated Stiffener Beams

The superstructure consists of longitudinal glued-laminated deck panels with transverse glued-laminated stiffener beams.

622.2 - MATERIALS:

622.2.1 - Stress-Laminated Plank Deck, Solid Sawn Curbs, Guardrail Posts and Guardrail: All structural lumber used in the bridge construction will be Northern Red Oak except when Structural Glued-Laminated Timber is specified on the Plans.

All lumber and timber shall be graded in accordance with the Standard Grading Rules for Northeastern Lumber, as published by the Northeastern Lumber Manufacturer's Association Incorporated (NELMA), 272 Tuttle Road, P.O. Box 87A, Cumberland Center, Maine 04021, Telephone # (207) 829-6901.

Lumber for stress-laminated plank decks shall be # 3 Grade or better except wane shall meet # 1 Grade, as specified in the above grading standards Section 20.0 for Structural Joists and Planks. Grading may be performed after rough sawing to approximate dimensions, however crook shall meet the grading rules after preservative treatment. Stress-laminated deck lumber shall be sawed, surfaced two sides (S2S), resawed or otherwise processed so that the resulting fit between adjacent planks will meet the applicable Manufacture-Standard as defined by the NELMA grading rules for the faces.

The thickness of planks shall be from 1 ½ inches (40 mm) through 2

622.2.2

inches (50 mm) with only one size to be used in a bridge deck. Stress-laminated deck lumber shall contain not less than 12% nor more than 19% moisture (oven dry basis) after preservative treatment and prior to fabrication. Moisture content is to be confirmed in accordance with AWWA A6, using a minimum sample size of 40 cores per lot of deck lumber taken at random throughout the lot. The length of each core sample shall be one-half the thickness of the deck plank.

Timber for guardrail posts and blockouts, curbs, curb blocks, and guardrail when specified on the Plans shall be "# 2 Grade" or better as specified in the above grading standards Section 25.0 for Beams and Stringers. Material may be rough saw cut to the approximate dimensions shown on the Plans so that after conditioning and preservative treatment the actual dimensions are within plus or minus 3/16 inch (5 mm) of plan cross sectional dimensions.

All lumber and timber shall be graded, approved and stamped or tagged by a lumber grader, certified by an agency who has been approved by The Board of Review of the American Lumber Standards Committee.

All dimensions shown on the Plans for structural lumber shall be actual dimensions.

When structural glued-laminated timber members are specified on the Plans they shall meet the requirements of Section 622.2.6.

622.2.2 - Timber Substructures: All beams, stringers, posts, timber and lumber for timber substructures shall be "# 2 Grade" or better Northern Red Oak as specified in the above grading standards Section 25.0 for Beams and Stringers, Section 26.0 for Posts and Timbers or Section 20.0 for Structural Joists and Planks as appropriate.

All beams, posts, timber, stringers and lumber shall be graded, approved and stamped or tagged by a lumber grader, certified by an agency who has been approved by The Board of Review of the American Lumber Standards Committee.

All dimensions shown on the Plans for structural beams, stringers, posts, timber and lumber shall be actual dimensions.

When structural glued-laminated timber members are specified on the Plans they shall meet the requirements of Section 622.2.6.

622.2.3 - Metal:

622.2.3.1 - Steel Products: Structural shapes, plates and bars (except steel thread bars and fabrication bars) shall meet the requirements of AASHTO M 270M Grade 250. Components requiring fabrication will be made in accordance with Section 615 of the Standard Specifications. Where welded fabrication is required, all work shall be in accordance with ANSI/AASHTO/AWS Bridge Welding Code D1.5. Nondestructive testing of welds is not required. All steel products shall be hot-dip galvanized, after fabrication to AASHTO M 111 except where otherwise noted. Properly documented certified mill test reports shall be provided for all above steel products. Certifications for hot-dip galvanizing shall be provided by the

galvanizing plant.

622.2.3.2 - Thread Bars: Steel thread bars shall be the size shown in the Plans and shall be designed to allow the use of anchor nuts and couplers that thread onto the deformations. Anchor nuts and couplers shall be of a design and material recommended by the thread bar manufacturer to develop the full tensile strength of the bar. Thread bars shall meet the following:

622.2.3.2.1: Steel thread bars shall be manufactured by a suitable process which will produce bars meeting the chemical, mechanical and physical requirements of AASHTO M 275M, Type II. Where 5/8 inch (15 mm) diameter nominal size bars are specified on the Plans, bars may be supplied to the following requirements in lieu of the above.

622.2.3.2.2: Alternate bars for 5/8 inch (15 mm) size shall meet the following TABLE:

Nominal Diameter (max.)	¾ inch (19 mm)
Effective cross sectional area	0.28 Sq. inches (181 mm ²) min 0.33 Sq. inches (213 mm ²) max.
Height of deformations	0.045 inches (1.14 mm) min. 0.060 inches (1.52 mm) max.
Weight per linear meter	1.15 lbs (1.71 kg) min. 1.35 lbs (2.01 kg) max.
Yield strength (min.)	34,000 lbs (151.2 kN) (0.2% offset or 0.7% extension under load)
Ultimate strength (min.)	40,000 lbs (177.9 kN)
Elongation, min. (20 bar diameters) or Elongation, min. (10 bar diameters)	4.0% 7.0%
Heat analysis:	
Phosphorus content (max.)	0.040%
Sulfur content (max.)	0.050%

All tension tests to be performed in accordance with AASHTO M 275M.

622.2.3.2.3: Properly documented certified mill test reports will be provided for each heat of steel thread bars. Mill test reports will document compliance with paragraph 622.2.3.2.1 or 622.2.3.2.2 as applicable.

622.2.3.2.4: All thread bars, anchor nuts, couplers and ancillary hardware shall be hot-dip galvanized to AASHTO M 111. Prior to galvanizing, thread bars shall be blast cleaned to Steel Structures Painting Council Surface Preparation Specification Number 6 (Commercial Blast Cleaning). Acid

622.2.3.3

pickling of thread bars will not be permitted. To provide for proper assembly after galvanizing, excess zinc shall be removed by machining using suitable thread taps and dies from the threads of nuts, couplings and thread-bars as necessary. Removal of excess zinc by heating will not be permitted.

622.2.3.3 - Timber Fasteners: Dome head drive spikes and washer head drive spikes noted on the Plans shall be Sealtite Dome Head Drive Spikes and Lewis Washer Head Timber Drive Spikes as manufactured by Lewis Bolt and Nut Company, Minneapolis, Minnesota, or as approved by the Engineer. Round head bolts noted on the Plans shall be metric round head square neck bolts (carriage bolts) meeting the requirements of ANSI/ASME Specification B18.5.2.2M. Dome head bolts noted on the Plans shall have a circular dome shaped head and shall meet the requirements of ASTM A 307, except head markings are not required. Hex head bolts shall be hex or heavy hex and shall meet ASTM A 307. 1¼ inches (30 mm) dome head bolts shall have a minimum head diameter of 3 inches (75 mm) and a minimum head height of 9/16 inch (14 mm). Nuts shall be hex or heavy hex meeting AASHTO M 291M or AASHTO M 292M. Round washers shall be Type A, Wide Series meeting the requirements of ASTM F 844. Washers noted on the Plans as "timber washers" shall be oversize in diameter and thickness, manufactured from cast or malleable iron, hot-dip galvanized and of a style and design typically used in heavy timber construction. Fluted steel dowels (spiral dowels) shall be as manufactured by Wadsworth Equipment Company, Akron, Ohio or as approved by the Engineer. All timber fasteners shall be hot-dip galvanized to meet AASHTO M 232M. Mill test reports, certifications or testing of above fasteners is not required. Acceptance will be based on visual inspection at the project site or at the fabricator's plant.

622.2.3.4 - Anchor Bolts at Abutments or Piers: Anchor bolts at bridge abutments or piers shall be ¾ inch (20 mm) diameter steel "all thread" rods meeting the requirements of ASTM A 307, hot-dip galvanized to AASHTO M 232M. Bolt length is governed by deck, timber or steel angle thickness and embedment in concrete as noted on the Plans. Nuts and washers shall be as specified in paragraph 622.2.3.3. Mill test reports, certifications or testing of anchor bolts, nuts or washers is not required. Acceptance will be based on visual inspection at the project site or at the fabricator's plant.

Anchor bolts in concrete are to be installed using Molly "Parabond" Capsule Chemical Anchor System as manufactured by Molly Fastener Group, 504 Mt. Laurel Avenue, Temple, Pennsylvania 19560, Telephone: (215) 929-5674, or Sup-R-Set Capsules Chemical Anchor System as manufactured by Gunnebo Fastening Corp., P.O. Box 1589, York, PA 17405, Telephone (717) 846-2200, or Rawl Chem-Stud #6500 as manufactured by the Rawl Plug Co., Inc., Two F.B. Powers Square, New Rochelle, NY, 10802, Telephone (914) 235-6300, or approved equal. Installation of anchor bolts is to be in accordance with the chemical capsule manufacturer's recommendations. The end of each anchor bolt is to be ground to the configuration recommended by

the chemical capsule manufacturer.

Certification or testing of chemical anchor system is not required.

622.2.3.5 - Split Rings, Shear Plates and Nails: Split rings shown or noted on the Plans shall be TECO Wedge - Fit Split Rings, Type M-2, as manufactured by TECO, Colliers, West Virginia or approved equal. Shear plates shown or noted on the Plans shall be TECO Shear Plates Type 143-D Galvanized, as manufactured by TECO, Colliers, West Virginia or approved equal. Split rings and shear plates shall be furnished hot-dip galvanized. Mill test reports, certifications or testing of split rings is not required. Acceptance will be based on visual inspection only.

Miscellaneous nails required during fabrication will be sized by the fabricator considering the intended function. Certification or testing is not required.

622.2.3.6 - Steel Beam Guardrail: Steel beam guardrail, fasteners and accessories, when specified on the Plans, shall be in accordance with AASHTO M 180, Type II, Class A, unless otherwise noted. All materials shall be supplied by companies which are included on the Division's list of Certified Suppliers of Guardrail and Associated Hardware.

The Contractor will be responsible for drilling additional holes in the rail, if required, to fit the post spacing shown on the Plans.

622.2.3.7 - Anchor Bolts For Guardrail and Diaphragm Fasteners: Anchor bolts connecting steel beam guardrail to wood guardrail shall meet AASHTO M 164M with appropriate nuts and washers, all hot-dip galvanized to AASHTO M 232M. Pipe sleeves at guardrail connection are to be DN25 standard galvanized steel pipe, schedule 40, and may be cut to specified length by pipe cutter or saw cut without repair of cut surface.

Lag screws and standard washers for installation of diaphragms between structural glued-laminated beams shall be standard hex head lag screws and standard mild steel washers all hot-dip galvanized to AASHTO M 232M.

Steel rods, threaded both ends, for installation of diaphragms and guard rail post supports to structural glued-laminated beams shall be manufactured from steel rod meeting AASHTO M 270M Grade 250 or AASHTO M 169 Grade 1018 thru 1045. Nuts and timber washers shall meet the requirements of Section 622.2.3.3. All materials shall be hot-dip galvanized to AASHTO M 232M.

Mill test reports, certifications or testing of anchor bolts, nuts, washers, lag screws or pipe sleeves is not required. Acceptance will be based on visual inspection at the project site or at the supplier's plant.

622.2.3.8 - Fabrication bars and accessories for modular construction: Fabrication bars shall be nominal $\frac{3}{4}$ inch (20 mm) O.D. all thread high strength steel bar with the following properties:

622.2.3.9

Nominal diameter	¾ inch (19 mm)
Yield Strength (min.)	34,000 lbs (151.2 kN)
(0.2% offset or 0.7% extension under load)	
Ultimate strength (min.)	40,000 lbs (177.9 kN)
Elongation, min. (20 bar dia.)	4.0%
or	
Elongation, min. (10 bar dia.)	7.0%
Chemical Analysis:	
Phosphorus content (max.)	0.040%
Sulfur content (max.)	0.050%

Tension tests shall be performed on full size samples in accordance with ASTM A 370. Threads shall be 10 Threads per inch (2.5 mm per thread) Unified Coarse Thread Series as specified in ANSI B1.1 and shall have Class 2A tolerances.

Nuts for use with fabrication bars shall be heavy hex series and shall meet AASHTO M 291M Grade C, D or DH, or shall meet AASHTO M 292M Grade 2 or 2H.

Bearing and anchor plates shall be carbon steel and shall meet AASHTO M 270M Grade 250.

All material supplied under this paragraph is to be plain uncoated. Hot dip galvanizing is not required.

The Contractor will provide the Engineer with mill test reports or certifications from the material producers which indicate the materials supplied are in conformance with the referenced specifications.

622.2.3.9 - Aluminum Deck Bracket: Cast aluminum brackets connecting glulam deck panels to glulam stringers shall be of a design and dimensions as shown on the Plans and shall meet the requirements ASTM B 108 Alloy 356.0 Temper T6. The Contractor shall provide the Engineer with a letter of certification from the foundry producing the castings. Acceptance shall be based on the certification and visual inspection at the fabrication plant or on the project site.

622.2.4 - Preservative Treatment: Treatment of all sawn timber and lumber shall be by the Empty Cell process in accordance with the American Wood Preserver's Association (AWPA) Standard C2. Treating solution shall be Coal Tar Creosote conforming to AWPA Standard P1. Treatment retention shall be 7.0 pcf (112.1 kilogram per cubic meter (kg/m³)) minimum and shall be determined by the gauge or weight method.

All lumber and timber members shall be dimensioned, cut, machined and

drilled prior to preservative treatment except stress-laminated deck lumber 2 inches (50 mm) or less in thickness, which can be drilled or cut to length after treatment. Deck lumber cut to length after pressure treatment shall have the saw cut ends treated in accordance with AWPAs Standard M4. Holes in deck boards drilled to accept steel thread bars, to provide for void drains, or to attach guardrail and curbs do not require treatment of holes.

All surfaces shall be free of excess treatment solutions at the time of delivery to the job site.

622.2.5 - Elastomeric Bearing Pads: Elastomeric bearing pads shall be of the size and type shown on the Plans and shall conform to the AASHTO M 251 with a durometer hardness of 60.

622.2.6 - Structural Glued-Laminated Timber (Glulam): All structural Glued-Laminated Timber members shall be visually graded Southern Pine or visually graded Douglas Fir-Larch as shown on the drawings and specified below.

Materials, manufacture and quality control shall be in accordance with American National Standards Institute/American Institute of Timber Construction (ANSI/AITC) Standard A 190.1, Structural Glued-Laminated Timber, and shall provide allowable design values as shown on the Plans. All design values are based on wet condition of service. Adhesives shall meet the requirements of wet-use for wet conditions of service. Appearance of the members shall be industrial grade. Surfaces of members shall be not sealed and members shall not be wrapped. Members shall be marked with a Quality Mark and, in addition, a Certificate of Conformance shall be provided to the Engineer to indicate conformance with ANSI/AITC A 190.1, Structural Glued-Laminated Timber.

All Structural Glued-Laminated Timber members shall be preservative treated in accordance with AITC Standard 109, Standard for Preservative Treatment of Structural Glued-Laminated Timber and AWPAs Standard C28, Standard for Preservative Treatment of Structural Glued-Laminated Timber.

Treating solution shall be Coal Tar Creosote conforming to AWPAs Standard P1. Treatment retention shall be 12.0 pcf (192.2 kilogram per cubic meter (kg/m^3)) minimum, and shall be determined by the assay method. Incising is required prior to treatment for members manufactured from Douglas Fir-Larch.

AT THE COMPLETION OF THE TREATING CYCLE, ALL STRUCTURAL GLUED-LAMINATED MATERIAL SHALL BE CLEANED BY FINAL STEAMING FOR 3 HOURS AT A TEMPERATURE BETWEEN 220° F (105° C) AND 240° F (115° C).

All surfaces shall be free of excess treatment solution at the time of delivery to the job site.

All Structural Glued-Laminated Timber members shall be dimensioned, machined, have holes bored and cut to proper length prior to preservative treatment except diaphragms for Type B and C bridges may be trimmed to length for up to 1 inch (25 mm) after treatment provided the trimming is

622.3

followed by re-treatment in accordance with AWP Standard M4. Holes bored for lag screws for Type B and C bridges may be done after preservative treatment provided all holes are treated in accordance with AWP Standard M4.

622.3 - QUALITY CONTROL:

622.3.1 - Contractor's Responsibility: The Contractor is responsible for control of the product through all manufacturing operations to assure that the completed work is in conformance with these specifications.

As required by paragraphs 622.2.1 and 622.2.2, all lumber and timber shall be graded, approved and stamped or tagged by a certified grader. The Contractor shall schedule, contract and otherwise arrange for the specified grading inspection. Cost of the inspection is to be included as incidental to the work. The Contractor will provide the Engineer suitable reports which document the acceptance of the lumber by the certified grader.

622.3.2 - Manufacturers of Structural Glued-Laminated Timber: All manufacturers of Structural Glued-Laminated Timber (Glulam) members shall be a "licensed laminator" by the AITC as required by ANSI/AITC Standard 190.1. A list of AITC licensed laminators can be obtained from the American Institute of Timber Construction, 11818 S.E. Mill Plain Boulevard, Suite 415, Vancouver, Washington 98684, Telephone (206) 254-9132 or (800) 525-1625.

622.3.3 - Wood Preserving Plant: The wood preserving plant shall comply in all respects with AWP Standard M3, Standard Quality Control Procedures for Wood Preserving Plants. The quality control inspector's responsibilities and inspection procedures are to be in accordance with AWP Standard M3, Standard Quality Control Procedures for Wood Preserving Plants and AWP Standard M2, Standard for Inspection of Treated Lumber Products. The quality control inspector shall conduct all inspections and tests and maintain all records and reports required by the above mentioned AWP Standards and shall provide copies to the Engineer. Upon completion of all treating operations the treater will also supply a Certificate of Compliance as required by paragraph 7.1 of AWP Standard M3.

622.3.4 - Division's Inspection: The Division shall conduct routine inspections of all laminating, manufacturing, sawing, machining, grading and treating operations to assure the Contractor is complying with the specification requirements. Where deficiencies in material or procedures are noted by the Division inspector, the Contractor shall take immediate steps to correct the deficiency. Any materials found defective or deficient will be rejected and shall be replaced with acceptable material at no cost to the Division.

622.4 - SHOP AND ERECTION DRAWINGS:

The Contractor shall submit to the Engineer, in the required number of copies, a complete set of shop and erection drawings as required by Section 105.2 of the Standard Specifications. The drawings shall consist of such detail Plans as may be reasonably required for the successful completion of the work.

Shop drawings shall include detailed dimensions and arrangement of the stress-laminating system, deck lumber dimensions including joint locations where full length boards are not utilized, full dimensions and bolting layout of the curb and guardrail when specified, and all bearing details. Shop drawings shall also include details of all Structural Glued-Laminated Timber members.

Upon completion of all fabrication operations and shipment of all material to the project site the Contractor shall forward to the Engineer a complete set of as-built shop drawings in reproducible quality (Mylar or equivalent). The set will consist of the latest revisions of each individual shop drawing that has been previously submitted and approved by the Engineer.

All drawings shall be submitted to the Engineer for approval a minimum of two (2) weeks prior to the start of fabrication. All dimensions shall be in metric units only.

CONSTRUCTION METHODS

622.5 - CONSTRUCTION METHODS:

Stress-laminated and structural glued-laminated timber bridges are to be fabricated and erected in accordance with the Plans and these specifications.

622.5.1 - Handling: Treated timber shall be carefully handled without sudden dropping, breaking of outer fibers, bruising, or penetrating the surface with tools. Treated members shall be handled with web slings. Cant hooks, peaveys, pikes, cables, chains or hooks shall not be used. When metal bands are used to bundle members, corner protectors shall be provided to prevent damage. Structural glued-laminated beams shall be tipped and lifted on edge using web slings at as many points as necessary to prevent damage. Steel spreader beams shall be utilized to prevent eccentric loading of long members.

Glulam plank deck panels may be lifted flat using fabricated steel C-shaped brackets that fit over the member ends. The contractor has complete responsibility for utilizing proper shipping and handling techniques. Any damage shall be repaired or replaced to the satisfaction of the Engineer at no additional cost.

622.5.2 - Stress-Laminated Deck Assembly: Stress-laminated decks may be prefabricated at a manufacturing or fabrication facility. The full width or sections of the deck may be prefabricated and stressed, or panels may be fabricated, joined and stressed in the field.

If decks are fabricated in sections and stressed using bearing plates under the thread bar coupler, the bearing plates must be removed after all sections have been joined.

622.5.3

Butt joints are permitted in the lamination provided: a) Lamination length is not less than 4 ft (1200 mm); b) No butt joints are located within a distance equal to the deck thickness from a stressing bar, and; c) No more than one butt joint occurs in any five adjacent laminations within a distance of 2 ft (600 mm). The joint layout is to be shown on the shop drawings.

Gaps between butt ends of deck boards shall be 1 inch (25 mm) or less. The height differential between adjacent deck boards shall be $\frac{3}{4}$ inch (20 mm) or less.

Holes for stressing bars shall be large enough to allow a bar with a coupler, if used, to be removed from the stressed deck, but shall not exceed 20% of the width of the board, but may be $1\frac{3}{4}$ inch (45 mm) maximum on a 7 inches (175 mm) board.

Holes into the deck for attaching the deck to the substructure and for attaching curbs and posts to the deck shall not be drilled until after Stage 2 of the stressing procedure is completed. Holes in the substructure shall not be drilled until the deck is in place and after Stage 2 of the stressing procedure is completed.

622.5.3 - Stressing: Stressing bars shall be tensioned with a hydraulic jack. The jack shall be calibrated at least yearly to provide an accurate indication of load.

Stressing bars shall be tensioned to the specified load shown on the Plans. Stressing shall be done in accordance with the following procedure:

Stage 1: Load each bar to 50 percent of the specified load using a bar stressing sequence which will prevent distortion and maintain a uniform bridge (panel) width for the full length of the bridge. Repeat using the full specified load until all bars are properly tensioned.

Stage 2: A minimum of five (5) days but not more than seven (7) days after the completion of Stage 1, reload all bars to the specified load.

Stage 3: A minimum of four (4) but not more than six (6) weeks after the completion of Stage 2, reload all bars to the specified loads shown on the Plans.

During the stressing procedure, the load in the first bars that were stressed will most likely decrease as the other bars are stressed. In all three (3) stages, after the Contractor is satisfied that all bars are stressed to the proper load, Contractor shall return to the first three (3) full width bars that were stressed and verify on the hydraulic stress gauge that all three (3) maintained a minimum of 90% of the specified load. If any of the first three (3) full width bars did not maintain at least 90% of the specified load, all the bars on the bridge shall be stressed again. The checking of the first three (3) full width

bars and subsequent stressing of all bars shall be repeated until they maintain at least 90% of the specified load.

The Engineer shall be notified at least two (2) days prior to beginning each stressing stage.

No vehicles shall be allowed on the bridge until the completion of Stage 2 stressing.

622.5.4 - Camber: An upward curve or camber shall be provided in each bridge as noted on the Plans. The camber shall be a uniform curve in the length of the bridge and shall show maximum offset at the approximate center of the span. Camber shall be consistent across the bridge width and measurement shall be made at both edges and the centerline.

622.5.4.1 - Type A Bridges: When the full bridge width, or sections, are prefabricated and stressed at the fabrication facility, the fabricator shall introduce sufficient initial camber, prior to stressing, so that under full dead load the final camber will be as specified. When panels or individual members are delivered loose, they shall be erected over a temporary support to induce the required camber across the full width of the bridge and shall be adjustable so that it can be lowered to allow full dead load on the bridge, or can be raised to induce additional camber should it become necessary.

If 75% of the final camber is not provided under full dead load the Contractor shall support the structure on a temporary support, loosen all stressing bars, induce additional camber by raising the support, restress all bars and lower support to verify proper camber.

622.5.4.2 - Type B, C, D and E Bridges: Structural Glued-Laminated Timber members shall be manufactured with the camber shown on the Plans. The camber specified is with no load on the member.

622.5.5 - Modular Construction: When specified on the Plans the bridge will be fabricated and erected using modular techniques as described below. The applicable provisions of 622.5.1 through 622.5.4 also apply to modular fabrication and erection.

Modular construction does not apply to Type D and E bridges.

622.5.5.1 - Module Assembly: Each module shall consist of the appropriate number of rows of individual deck planks so when mated to the exterior glued-laminated beams the total module width will be as noted on the Plans after the third stressing. The Contractor is responsible for including as many additional rows of deck planks as may be necessary to compensate for lumber compression or shrinkage thru all three stages of stressing.

The deck planks shall be assembled with the two module beams using jigs, pipe guides and nails or other means so that proper alignment and beam camber can be maintained prior to inserting stressing bars. After the two beams and rows of deck planks are properly assembled, steel thread bars meeting the

622.5.5.2

requirements of 622.2.3.2, except the bars need not be coated, shall be inserted in all 2 ft (600 mm) center holes. Stage 1 stressing shall be performed before each module is moved from the assembly jig or the module is handled in any manner. Handling of modules is to be in accordance with 622.5.5.4. In addition, high strength steel fabrication bars meeting the requirements of 622.2.3.8 shall be inserted in all 6 ft (1800 mm) center holes. The 2 ft (600 mm) center bars can be removed before shipping from the fabrication shop and must be removed before the modules are erected on the project site. The fabrication bars on 6 ft (1800 mm) centers will remain permanently in the bridge, except for the exterior (fascia) modules where the bars shall be removed after completion of the field stressing operation. Galvanized bearing plates shall be used on the outside of the fascia modules for all 2 ft (600 mm) center bars. All other bearing plates may be uncoated.

The Contractor is responsible for maintaining the squareness of each module. This may require additional diaphragms, stressing rods, braces, etc. either temporary or permanent. All materials required for this purpose shall be clearly shown on the shop drawings and shall be noted as either temporary or permanent. Materials noted as permanent shall meet all quality requirements of this specification. Attachment of temporary materials shall be such that the preservative envelope of the bridge members is not damaged in any way. Holes in structural glued-laminated members shall be bored prior to preservative treatment and temporary holes shall be filled with treated wood plugs to the satisfaction of the Engineer. Regardless of the method chosen by the Contractor to control module squareness, each completed and fully stressed module at any cross-section throughout its length shall not be out-of-square by more than 1/8 inch (1 mm) per ft (100 mm) of web depth when measured at the top or bottom outer surface of either module web. No more than 0.01 inch (1 mm) of sweep, measured at the module centerline, is allowed per ft (1000 mm) of length. When fully assembled, no more than 0.03 inch (3 mm) of sweep, measured at the bridge centerline is allowed per ft (1000 mm) of length. When fully assembled the bridge width shall be at least as wide as the plan dimension but not more than 1½ inches (40 mm) wider than the plan dimension at any point. No separate payment will be made for these additional materials or labor used to control module squareness. Cost to be included in the unit price for the fabricated bridge members.

622.5.5.2 - Shop Module Stressing: All steel thread bars in the 2 ft (600 mm) center holes shall be stressed to the load shown on the Plans. All three stages of stressing shall be performed in the fabrication shop. Upon completion of each stage of stressing, the hex nuts on the fabrication bars on 6 ft (1800 mm) centers shall be fully tightened using the full effort of a man on an ordinary spud wrench.

622.5.5.3 - Curbs, Guardrail Posts and Diaphragms: Curbs and guardrail posts for Type A bridges shall be shop installed after the second stressing and at any phase for Type B or C. Diaphragms shall be shop installed

after the third stressing. Diaphragms and end blocks shall be fabricated such that a maximum gap of 3/16 inch (5 mm) exists between each side of the diaphragm or end block and the webs of the beams. Some trimming to length of the diaphragms may be necessary to compensate for the loss of module width due to stressing. See 622.2.6 for treating requirements after trimming to length.

622.5.5.4 - Handling, Shipping and Erection: As each module is assembled in the fabrication shop, a handling and erection lifting ring system shall be installed after the Stage 1 stressing. Details of the lifting ring system are shown on the Plans. All handling of the modules shall be performed using the lifting rings. Use of fork lifts under the modules, slings, choker cables, grab hooks, etc. is prohibited.

Two (2) days after the Stage 3 stressing is completed, the bars on 2 ft (600 mm) centers (not the bars on 6 ft (1800 mm) centers) can be removed, or, all the bars can remain in for shipping. If the Contractor elects to leave all bars in place for shipping, the bars on 2 ft (600 mm) centers must be removed prior to erection. After the Stage 3 stressing and prior to erection, the fabrication bars on 6 ft (1800 mm) centers shall be saw cut off flush with the face of the hex nut, except for the bars on the fascia side of the exterior module which can remain long to facilitate removal of the fabrication bars after erection.

The first module should be positioned on the abutments as precise as possible and secured to the bridge seat. Careful alignment of the remaining modules will facilitate installation of the full width stressing rods.

The modules shall be stressed together after inserting stressing rods and placement of bearing plates. Only one stressing operation is required in the field, although several passes over all the bars may be required to meet the 90% load requirement of 622.5.3.

Upon completion of erection, the fabrication bars in the fascia modules shall be removed and the holes plugged with a treated wood plug.

The handling and erection lifting ring system components shall be removed and will remain the property of the Contractor. Cost of the lifting ring system is considered incidental to Item 622020-*, Stressing Hardware. Holes in the stressed deck shall be plugged with treated wood plugs.

Field nailing to any treated bridge component is prohibited.

622.5.6 - Backwall Installation: Backwalls shown on the Plans shall not be placed until after completion of erection of all superstructure components. The end of the bridge members may be used as a form for placement of concrete backwalls provided the preformed joint filler is suitably secured to the bridge. The end diaphragms may require additional bracing or blocking to prevent damage from use as a concrete form. The Contractor is responsible to provide the necessary additional support and will repair any damage to the satisfaction of the Engineer.

622.6 - METHOD OF MEASUREMENT:

622.6.1

622.6.1 - Stress-Laminated Timber Bridge Fabricated and Installed:

The quantity of work done will be measured in 1,000 ft board measure (Mfbm)(cubic meter (m^3)) as established in the proposal which is based on actual plan sizes of all lumber and timber including structural glued-laminated timber shown on the Plans, and shall include bearings and bearing pads if specified, preformed joint sealer, hot-poured joint sealer, timber connectors and all necessary hardware, except stressing hardware and steel beam guardrail, complete in place and accepted in the finished structure for the structure type noted on the Plans.

Stressing hardware will be measured as a separate item.

Steel beam guardrail and hardware will be measured as Section 607 Items.

622.6.2 - Stress-Laminated Timber Bridge Fabricated and Delivered:

The quantity of work done will be measured in 1,000 ft board measure (Mfbm)(cubic meter (m^3)) as established in the proposal which is based on actual plan sizes of all lumber and timber including structural glued-laminated timber shown on the Plans, and shall include bearings and bearing pads if specified, timber connectors and all necessary hardware, except stressing hardware and steel beam guardrail, and delivered in the manner and to the site set forth in the contract documents for the structure type noted on the Plans.

NOTE: Stressing hardware will be measured as a separate item

622.6.3 - Structural Glued-Laminated Timber Bridge Fabricated and Installed: The quantity of work done will be measured in 1,000 ft board measure (Mfbm)(cubic meter (m^3)) as established in the proposal which is based on actual plan sizes of all structural glued-laminated members and other timber components as shown on the Plans, and shall include bearings and bearing pads if specified, preformed joint sealer, hot-poured joint sealer, timber connectors and all necessary hardware, except steel beam guardrail, complete in place and accepted in the finished structure for the structure Type noted on the Plans.

Steel beam guardrail and hardware will be measured as section 607 Items.

622.6.4 - Structural Glued-Laminated Timber Bridge Fabricated and Delivered: The quantity of work done will be measured in 1,000 ft board measure (Mfbm)(cubic meter (m^3)) as established in the proposal which is based on actual plan sizes of all structural glued-laminated members and other timber components as shown on the plans, and shall include bearings and bearing pads if specified, timber connectors and all necessary hardware, except steel beam guardrail, and delivered in the manner and to the site set forth in the contract documents for the structure Type noted on the Plans.

622.6.5 - Timber Substructure: The quantity of work done will be measured in 1,000 ft board measure (Mfbm)(cubic meter (m^3)), computed on the basis of actual plan sizes of all lumber and timber members shown on the Plans, and shall include all necessary hardware complete in place and accepted

in the finished structure.

622.6.6 - Stressing Hardware: The quantity of work for "Stressing Hardware" will be measured and paid for as lump sum. Stressing hardware includes stressing bars, plates, nuts, handling and erection lifting ring system components and any other hardware related to the stressing of the timber.

For 622.6.1 "Stressing Hardware" shall include the initial stressing and restressing at five (5) days and four (4) weeks.

For 622.6.2 "Stressing Hardware" shall include all material delivered in the manner and to the site set forth in the contract documents. When modular construction is specified, "Stressing Hardware" shall also include the initial stressing and restressing at five (5) days and four (4) weeks.

622.7 - BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials, except as above noted, and doing all the work herein prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

622.8

622.8 - PAY ITEMS:

SECTION 623

PNEUMATICALLY APPLIED MORTAR

623.1-DESCRIPTION:

This work shall consist of repair of concrete structures, protection of structural steel, or any other type of work as may be designated on the Plans, using pneumatically placed mortar, in accordance with these Specifications and in reasonably close conformity with the dimensions and design shown on the Plans or as directed by the Engineer. It shall include removal of all loose, soft, honeycombed, and disintegrated concrete, the removal of sound surface concrete in areas designated for repair, the preparation of the surface, the furnishing and placing of reinforcing steel, including wire fabric, dowels, and expansion anchor bolts, and mixing and applying pneumatically placed mortar composed of portland cement and sand.

Pneumatically placed mortar will be designated as Shotcrete. Shotcrete shall generally be used where the depth of repair does not exceed 6 inches (150 mm).

623.2-MATERIALS:

All materials shall conform to the applicable requirements of [Division 700](#), unless otherwise indicated.

For sandblasting operations the sand shall conform to the requirements in [688.2.4.1](#) and [688.2.4.3](#), III.

The reinforcing wire mesh shall be three inch (75 mm) by three inch (75 mm) by Size # W 1.4 wire, unless noted otherwise on the Plans.

CONSTRUCTION METHODS

623.3-PROPORTIONING AND MIXING:

Shotcrete shall consist of a mixture of portland cement and sand (three to five percent moisture) in the proportion of one cubic foot or 0.94 cwt of cement to three cubic feet of sand (one cement to three sand) (dry, loose measurement, due allowance being made for bulking). The materials shall be thoroughly mixed dry in a batch mixer. Before placing the mixture in the hopper, all lumps over ¼ in. (6 mm) shall be removed by screening.

623.4-CLEANING:

In concrete repair work, disintegrated concrete shall first be removed with pneumatic or hand tools. The surfaces shall then be thoroughly blasted to remove all dirt and loose materials, special care being taken in concrete repair work to thoroughly clean exposed reinforcing rods. Prior to applying each coat of Shotcrete, the concrete surfaces shall be cleaned and washed down with water and compressed air.

Structural steel shall be thoroughly cleaned of paint, rust, grease, and other foreign material. The Contractor may be required to Abrasive Blast Clean for this purpose.

623.5-PLACING REINFORCING MESH:

623.5.1-Repairing Concrete Work: In repairing concrete work, the reinforcing mesh shall be fastened to the concrete with $\frac{1}{4}$ by 4 in. (6 x 100 mm) expansion bolts spaced approximately 30 in. (750 mm) each way. Lapping of adjacent sheets shall be at least 4 inches (100 mm) in each direction and all laps shall be firmly tied together at intervals not exceeding 18 inches (450 mm). Care shall be taken to place the mesh away from the proposed finished concrete surface so that approximately a $\frac{3}{4}$ in. (19 mm) layer of Shotcrete shall be maintained outside of the plane of the mesh. In places where repairs are necessary for depths of 3 inches (75 mm) or more over considerable areas, two or more layers of mesh shall be used, the first layer being placed about $\frac{3}{4}$ in. (19 mm) out from the existing concrete.

623.5.2-Covering Structural Steel: In placing reinforcing mesh around structural steel, the mesh shall be cut in sheets of the proper size and separate sheets shall be bent carefully over templates in such a manner as to follow closely the outlines of the members to be covered and shall be securely held about $\frac{3}{4}$ in. (19 mm) out from the surfaces of the members. Adjacent sheets of mesh shall lap at least two meshes.

In placing the mesh, the rods shown on the Plans shall first be fastened to the steel, and subsequently the mesh shall be securely tied outside of these rods with wires spaced at approximately 1 ft. (300 mm) intervals. To allow for fasteners for holding the rods, holes not less than $\frac{9}{16}$ in. (14 mm) diameter shall be punched or drilled in the webs of members as near as possible to the top and bottom flanges. These holes shall be spaced on approximately 36 in. (900 mm) centers. Where steel members are more than 48 inches (1200 mm) in depth, and additional row of holes, spaced on approximately 36 in. (900 mm) centers, shall be provided on the centerline of the web.

623.6-PLACING SHOTCRETE:

623.6.1-General: Only experienced men shall be employed in placing Shotcrete.

No Shotcrete shall be placed during freezing weather or against surfaces on which there remains any frost.

623.6.2-Pressures: The pressure in the lower chamber of the cement gun shall be that which will produce a nozzle velocity of 375 to 500 ft. (115 to 150 m) per second when a tip with a three-fourths or 1 in. (20 or 25 mm) opening is used, and a nozzle velocity of 425 to 550 ft. (130 to 165 m) per second when a tip with a $1\frac{1}{4}$ in. (32 mm) opening is used. These velocities must be steadily maintained and shall be determined by a suitable nozzle velocity meter attached to the cement gun.

Water used for hydration at the nozzle shall be maintained at a uniform pressure, which shall not be less than 15 psi (100 kPa) greater than the air

pressure in the cement gun. In no case shall a greater amount of water be used than that necessary to produce proper hydration, especially when vertical surfaces are shotcreted.

623.6.3-Thickness of Covering: In repairing concrete, the Shotcrete shall be placed to a minimum total thickness of 1 in. (25 mm) in two or more coats.

In covering structural steel, the shotcrete shall be placed to a thickness of 1½ in. (40 mm) and in two layers.

In all cases, the final coat shall be shotcreted to a thickness of ½ in. (15 mm) against the previously straightened and thoroughly cleaned and wetted surfaces.

The stream of materials from the nozzle shall impinge as nearly as possible at right angles to the surface being covered. Any deposit of loose sand shall be removed prior to placing any original or succeeding layers of Shotcrete. After placing, all mortar patches shall be sounded and any indications of pockets shall be investigated and repaired as directed by the Engineer.

623.6.4-Joints: At the end of any day's work or similar stopping period, the Shotcrete shall be sloped off to a thin edge. Before shooting the adjacent section, the sloped portion shall be thoroughly cleaned and wetted. No square joints will be allowed.

623.6.5-Forms: Forms shall be structurally sufficient and of such design that rebound or accumulated loose sand can freely escape or be readily removed. Shooting strips shall be used at corners, edges, and on surfaces where necessary to obtain true lines and proper thickness.

623.6.6-Finishing and Curing: Following applicable layers of Shotcrete, the concrete surface shall be wood or steel finished as directed by the Engineer.

The Shotcrete shall be covered with burlap mats and kept wet for at least one week after placing; but where not practicable to use mats, it shall be kept wet by sprinkling for the same length of time.

623.7-METHOD OF MEASUREMENT:

623.7.1-Repairing Concrete Structures: Measurements will be based on the amount of cement in hundredweight (cwt) (hundred kilograms) used in the Shotcrete, the pound (kilogram) of Shotcrete reinforcing mesh, and the number of hook expansion bolts.

623.7.2-Covering Structural Steel: Measurement of all areas of Shotcrete shall be based on the actual area of the members to be covered, following the lines of the members, and payment per square foot (meter) will be made of such basis.

623.8-BASIS OF PAYMENT:

623.8.1

623.8.1-Repairing Concrete Structures: The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed in 623.9.1, which prices and payments shall be full compensation for furnishing all the material and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

623.8.2-Covering Structural Steel: The quantity, determined as provided above, will be paid for at the contract unit price bid for the item in 623.9.2, which price and payment shall be full compensation for furnishing all the materials, including reinforcing mesh and rods, and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

SECTION 624 PREFORMED ELASTOMERIC JOINT SEALER

624.1-DESCRIPTION:

This work shall include furnishing and installing preformed elastomeric joint sealers for bridge decks in accordance with these Specifications and in reasonably close conformity with the lines and grades shown on the Plans or established by the Engineer. The joint sealer, to serve both as a filler and a sealer, shall be furnished in the form of an extruded compartmented tube.

624.2-MATERIALS:

Material for preformed elastomeric joint sealer shall conform to the requirements of [708.2](#).

CONSTRUCTION METHODS

624.3-PREPARATION OF JOINT:

The joint shall be formed to provide the nominal opening at the specified temperature as shown on the Plans, edges of concrete or epoxy mortar adjacent to the joint shall be rounded to a radius of not more than ¼ inch (6 mm). A joint having insufficient opening may be required to be sawed or ground to the proper size. Where a joint opening is larger than that specified, the Contractor may be required to build up the joint with epoxy mortar or to furnish a larger size sealer as determined by the Engineer. The cost of any such additional work or material shall be borne by the Contractor.

Before placement of the sealer, the joint shall be thoroughly cleaned by brushing, compressed air or other means, so that it is free from dust, oil, grease or other foreign materials.

624.4-INSTALLATION:

The sealer shall be installed by suitable hand or machine tools which will not cause injury to the material during installation. A lubricant or lubricant-adhesive shall be used if, and as, recommended by the manufacturer of the sealer. During installation, the sealer shall not be subjected to lengthwise stretching; the length to be installed shall be measured prior to installation and cut or marked to indicate the installed length. Sealer for transverse joints shall be in one continuous length; longitudinal joint sealers may be spliced at intervals of not less than 50 ft. (15 meters) except where intersected by transverse joints. The top surface of the sealer after installation shall be ¼ in. (6 mm), with a plus 1/16 in. (2 mm) tolerance, below the adjacent roadway surface.

624.5-METHOD OF MEASUREMENT:

When this Item is called for on the Plans, the filler and joint sealer will be measured in place in linear feet (meters).

624.6-BASIS OF PAYMENT:

The cost of preformed elastomeric joint sealer, complete in place, including lubricant or lubricant-adhesive will be paid for at the contract unit price bid for the item listed below, which price and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

SECTION 625

DRILLED CAISSON FOUNDATIONS

625.1 – DESCRIPTION:

The work of this section includes the furnishing of all materials and the construction of foundations consisting of reinforced concrete caissons placed within drilled excavations. Each drilled caisson foundation shall consist of a shaft section, with the lower portion in a drilled rock socket and with the upper portion in a steel casing. This casing will normally be removed during concrete placement unless otherwise shown in the plans or directed by the Engineer.

625.2 - TESTS AND SUBMITTALS:

The Contractor shall deliver all submittals required by this specification to the Engineer no later than one month prior to constructing any drilled caissons shown in the plans. No drilled caissons shall be constructed prior to the Engineer's review and acceptance of all submittals and test hole results.

625.2.1 - Experience:

- 1) A satisfactory record of experience in drilled caisson construction is considered to be of the utmost importance in obtaining a satisfactory drilled caisson installation. The installation of the drilled caisson is required to be performed by a contractor or specialty subcontractor specializing in installing drilled caissons and having experience with caissons of similar length, diameter, and subsurface conditions as those shown in the contract documents.
- 2) The Contractor shall submit data on at least two projects performed during the past ten years, for which the Contractor (or the Subcontractor if applicable) has installed drilled caissons of a range of diameters and lengths similar to those shown in the plans, in similar quantities, and under similar subsurface conditions. The list of projects shall contain names and phone numbers of owners' representatives who can verify the participation in those projects.
- 3) The Engineer shall review and approve the Contractor's (Subcontractor's) caisson. If in the opinion of the Engineer the Contractor's qualifications are not adequate, the Contractor shall submit to the Engineer a proposed method of obtaining the necessary qualifications.
- 4) The installation of all components of the drilled caisson including; drilling, reinforcement placement, concrete placement, and required wet hole condition work, casing installation and removal, slurry placement, and any other work required to complete the drilled caisson, shall be performed by the approved contractor or specialty

subcontractor.

625.2.2 - Site Inspection: A signed statement shall be submitted affirming that the Contractor (or the Subcontractor if applicable) has inspected the project site and the available subsurface information including any available soil or rock samples.

625.2.3 - Installation Plan: The Contractor shall submit an Installation Plan for review by the Engineer. This plan shall provide information on the following:

- a) Name and experience record of the drilled caisson superintendent in charge of drilled caisson operations for this project.
- b) List of proposed equipment to be used on the project, including barges, cranes, templates, drill rigs, drills, augers, bailing buckets, final cleaning equipment, slurry desanding equipment, slurry pumps, core sampling equipment, welding equipment, tremie or concrete pumps, casing, etc.
- c) Details of overall construction operation sequence and the sequence of caisson construction in the piers and/or the abutments; taking due care not to damage fresh concrete by drilling in the immediate vicinity too quickly.
- d) Method for maintaining drilled caisson position and alignment during excavation, and details and sequencing of caisson excavation.
- e) Details of casing and splices to be used, including calculations (signed and stamped by a Professional Engineer knowledgeable in drilled caissons) showing ability of casing to withstand anticipated hydraulic and earth pressures and to withstand stresses due to installation without undue deformation. Description for withdrawal of casings to demonstrate that concrete will not be lifted during withdrawal.
- f) When the use of slurry is anticipated, details of the methods to mix, circulate, and desand slurry. Any request to use a slurry displacement method for the construction of caissons shall also provide information for the Engineer's approval as follows:
 1. Detailed description of proposed construction method.
 2. Concrete mix, as modified for use with the slurry displacement method.
 3. Components and proportions in proposed slurry mixture.

4. Tests proving slurry mixture will not degrade rock or interfere with bond.
 5. Methods to agitate slurry mixture prior to concrete placement.
 6. Methods to clean slurry mixture for re-use.
 7. Disposal methods for used slurry.
- g) Details of methods to thoroughly clean the caisson excavation.
- h) Details of reinforcing cage fabrication and placement including support of the reinforcing cage during handling, after installation, and during concrete placement, along with methods and devices that will be used to center the reinforcing cage and maintain concrete cover over the bars.
- i) Details of concrete placement including proposed operational procedures for free-fall, tremie, pumping or other methods.
- j) Sample of proposed drilled caisson report, proposed drilled caisson log, and proposed Preinstallation core hole log.
- k) Welding procedures and qualifications of welders and tackers as specified in ANSI/AWS D1.1 for casing steel and in ANSI/AWS D1.4 for reinforcing steel.
- l) Preinstallation Coring procedure.
- m) Qualifications and experience record of firm proposed to perform Preinstallation Coring, including experience record of the supervisor designated to oversee the work.
- n) Mix design for concrete and for non-shrink grout.
- o) Plan to minimize vibration and wheel loads in the vicinity of newly placed caissons.
- p) Plan for compliance with applicable environmental regulations, including but not limited to the protection of river water from degradation due to material excavated from drilled caisson locations or due to other harmful erosion, protection of the environment from slurry spillage or discharge if slurry is used, and general environmental protection of the area from all operations related to drilled caissons.

The Engineer will evaluate the Drilled Caisson Installation Plan for conformance with the Plans and Specifications. Within 14 days after receipt of the

plan, the Engineer will notify the Contractor in writing of any additional information required and/or changes necessary to meet the contract requirements. All procedural approvals given by the Engineer shall be subject to trial in the field and shall not result in any additional cost to the Division if they fail to perform also shall not relieve the Contractor of the responsibility to satisfactorily complete the work as detailed in the Plans and Specifications.

625.2.4 - As-Built Records: Within 24 hours of the completed construction of each drilled caisson, the Contractor shall submit a report on the actual location, alignment, elevation, and dimensions of the drilled caisson, and will also submit a completed drilled caisson log as specified herein.

625.2.5 - Test Hole: A test hole shall be drilled at the location and to the diameter and depth shown in the plans. The test hole shall be unreinforced but shall otherwise be constructed the same as other drilled caissons in this specification. The Contractor shall revise his methods and equipment as necessary during construction of the test hole when he is unable to carry out the requirements of this specification. Completed test holes shall be left in place except that the top of the caisson shall be removed to a depth of 2 feet (600 mm) below final ground line. Disturbed areas at the site of the test hole shall be restored to their original condition. If the Contractor fails to demonstrate the adequacy of his methods or equipment, the Engineer shall require additional test holes be provided at the Contractor's expense.

625.2.6 - Nondestructive Testing

625.2.6.1 - General Requirements: The nondestructive testing method known as Crosshole Sonic Logging (CSL) shall be used on any drilled caisson which is constructed with the placement of concrete underwater or as required in the plans. The testing shall not be conducted until at least twenty-four hours after placement of concrete is concluded in the caisson, and will be completed within 14 calendar days after such placement.

The CSL tests shall be conducted by the Engineer with the cooperation of the Contractor. The Contractor shall provide suitable working space and access to every tested caisson and shall provide a reliable 1000-watt generator for use by the Engineer.

625.2.6.2 - Preparation for Testing: To accommodate the CSL test requirements, the Contractor shall install a number of tubes in each caisson to be tested. The number of tubes per caisson shall be as tabulated below:

TABLE 625.2.6.2

Caisson Diameter	Number of Tubes	Tube Spacing
Up to 42" (1 049 mm)	3	120°
42" to 60" (1 050 mm to 1 499 mm)	4	90°
60" to 96" (1 500 mm to 2 399 mm)	6	60°
96" (2 400 mm) and larger	8	45°

The tubes shall be per section 625.4.4. Each tube shall have a round, regular internal diameter free of defects or obstructions including defects or obstructions at pipe joints; in order to permit the free, unobstructed passage of 1½ inch (35 mm) diameter source and receiver probes. The tubes shall be watertight and free from corrosion with clean internal and external faces to ensure passage of the probes inside and a good bond with the concrete outside.

Each tube shall be fitted with a watertight shoe on the bottom and a removable cap or plug on the top. The tubes shall be securely attached to the interior of the reinforcing steel cage. The tubes are typically wire-tied to the reinforcing cage every 40 inches (1 000 mm), or otherwise secured such that the tubes stay in position during placement of the cage and during placement of concrete. The tubes shall be installed in each shaft in a regular, symmetric pattern such that the tube spacing in degrees will correspond to that shown in the table above.

The tubes shall be as near to parallel as possible. They shall extend from 6 inches (150 mm) above the caisson bottom to at least 40 inches (1 000 mm) above the caisson top. No tube may be allowed to rest on the bottom of a drilled excavation. If the caisson top is sub-surface, then the tubes shall extend at least 2 ft (600 mm) above the ground surface or above the water surface if the ground surface is below water. Any joints required to achieve full length tubes shall be made watertight. Care shall be taken during placement of the reinforcing steel cage so as not to damage the tubes.

After placement of the cage, and before placement of concrete, the tubes shall be filled with clean water and the tube tops shall be capped or sealed to keep debris or other foreign matter out of the tubes. Care shall be exercised in the removal of caps or plugs so as not to apply excess torque, hammering, or other stresses that could break the bond between the tubes and the concrete.

625.2.6.3 - CSL Logging Procedures: Before placement of concrete, the Contractor shall investigate at least one tube per shaft. This investigation is to make sure that there are no bends, crimps, obstructions or other impediments to the free passage of the testing probes. A record of the tube length or lengths, including a note of the projection of the tubes above the top of the shaft shall be made. The Contractor shall provide information on the shaft bottom and top

elevations, length and construction dates to the Engineer prior to the CSL tests.

The Contractor shall make the caisson and the caisson site available to the Engineer for the conduct of the CSL tests. Any defects indicated by tests shall be evaluated by the Engineer and further tests may be conducted in regard to the extent of such defects. Any time required by such tests will be considered incidental to the work and will not be cause for extra compensation related to a claim or extension of contract.

625.2.6.4 - CSL Testing Results: The CSL test results will be compiled into a caisson integrity testing report for each caisson. The report will summarize and analyze any defect zones indicated on the logs. A copy of each report will be provided to the Contractor.

625.2.6.5 - Evaluation of CSL Test Results: The Engineer will evaluate the CSL test results and will determine whether or not the drilled caisson as constructed is acceptable. If the Engineer determines that the drilled caisson is acceptable based on the CSL tests, then the caisson and the caisson site will be turned back to the Contractor and further construction may proceed.

The acceptance of each drilled caisson shall be the decision of the Engineer, based on the results of the caisson integrity testing report and other information on the caisson placement. Rejection of a caisson shall require conclusive evidence that a defect exists in the caisson, which will result in inadequate or unsafe performance under service loads. If the Non Destructive Testing records are complex or inconclusive, the Engineer may require the Contractor to verify caisson conditions, in accordance with 625.2.6.6. If a defect is confirmed, the Contractor shall pay for all coring and grouting costs. If no defect is encountered, compensation for all coring and grouting will be in accordance with 104.3 and 109.4 of the Standard Specifications.

In the case that any caisson is determined to be unacceptable, the Contractor shall submit a plan for remedial action to the Engineer for approval. Any modifications to the foundation caisson and load transfer mechanisms caused by the remedial action will require calculations and working drawings stamped by a professional engineer registered in the State of West Virginia for all foundation elements affected. All labor and materials required to perform remedial caisson action shall be provided at no cost to the Division and with no extension of the contract time.

625.2.6.6 - Evaluation by Core Drilling: A drilled caisson that is found to be unacceptable shall be cored by the Contractor using double tube core barrels. One or more core holes shall be drilled at the location(s) as determined by the Engineer. A core sample shall be taken from each defect location, at a length specified by the Engineer. An accurate log of the core shall be kept and the core shall be crated and properly marked showing the caisson depth at each interval of core recovery. The core along with five copies of the coring log shall be provided to the Engineer.

If the quality of the caisson, as represented by the core samples, is

625.3

determined to be acceptable, then the caisson and the caisson site will be turned back to the Contractor and further construction may proceed. If the quality of the caisson is determined to be unacceptable, then the Contractor shall proceed in accordance with 625.2.6.5.

625.3 - DIMENSIONAL REQUIREMENTS:

The dimensional requirements for Placement Tolerances and Caisson Diameters shall be met prior to placement of reinforcing steel. The Contractor shall submit his corrective plan for any deviation from the caisson location, alignment and elevation tolerances, and reinforcement dimensional requirements to the Engineer for approval. The cost of any corrective action shall be borne by the Contractor.

625.3.1 - Placement Tolerances: For any drilled caisson the maximum permissible deviation from plumb shall be 1% or a ratio of 1:100 with respect to a truly vertical axis. For any drilled caisson at its top, the maximum deviation of the center shall be 3 inches (75 mm) from its project plan location.

625.3.2 - Caisson Diameters: Rock sockets shall be of a minimum diameter equal to the caisson diameter shown in the plans. Casings, extending upward from the rock surface, shall have a minimum inside diameter equal to the caisson diameter shown in the plans, but may be larger in diameter to expedite the Contractor's operations.

625.3.3 - Bottom Excavation: Excavation equipment and methods shall provide the completed caisson excavation with a flat bottom. The cutting edges of excavation equipment shall be normal to the vertical axis of the equipment within a tolerance of plus or minus 1¼ in. per 40 in. (30 mm per 1 000 mm) of diameter.

625.3.4 - Caisson Cutoff Elevations: For any drilled caisson the maximum permissible deviation from finished top of shaft elevation shall be minus 1 inch (25 mm) and plus 1 inch (25 mm).

625.3.5 - Reinforcement: After all concrete has been placed, the top of the reinforcing steel cage shall be no more than 4 inches (100 mm) above, and no more than 2 inches (50 mm) below, the plan elevation. The clearance to the reinforcing steel shall be 4 inches (100 mm), plus or minus 1 inch (25 mm). An absolute minimum clearance of 3 inches (75 mm) to the reinforcing steel is strictly required.

625.4 – MATERIALS:

625.4.1 - Concrete: Concrete for the drilled caissons shall be Class "B" (modified) and shall conform to the requirements of Section 601 of the Standard Specifications. The design 28-day compressive strength shall be not less than

4500 psi (31 Mpa) unless shown otherwise in the plans. The Contractor will prepare a mix design to attain this strength, retaining the basic characteristics of Class "B" concrete. Slump for dry placement will be 7 inches (175 mm) plus-or-minus 1 inch (25 mm). Unless otherwise specified in the plans, the cement shall be Type I.

For placement of caisson concrete by tremie or pumping, the cement content shall be increased to 8 bags per cubic yard (435 kg/m³), the slump shall be 8 inches (200 mm) plus-or-minus 1 inch (25 mm) and shall maintain a slump in excess of 4 inches (100 mm) throughout the concrete placement, and the maximum aggregate size shall be 1 inch (25 mm).

625.4.2 - Reinforcing Steel: Reinforcing steel for main vertical bars and ties shall conform to Section 709.1, deformed type, grade 60 (400). Reinforcing steel for use as spirals shall conform to Section 709.1, plain type, grade 60 (400).

625.4.3 - Casing: Metal casing shall be used whenever required to prevent caving of the soil material or to exclude ground water. Casing shall be metal, of unit or sectional construction, be strong enough to withstand handling stresses, withstand the pressures of concrete and of the surrounding earth and ground water, and prevent seepage of water. Also, the casing used shall be selected by the Contractor to control dimensions and alignment of excavations within tolerances, to seal the casing into impervious materials, and to execute all other construction operations.

Casing pipe shall conform to ASTM A 252/A 252M, Grade 2, for either temporary or permanent application.

Any required casing splices shall be welded in accordance with Section 625.2.3 e) of this specification with no interior splice plates, producing true and straight casing. All welding shall be in accordance with ANSI/AWS D1.1.

Permanent casing is required in all caissons where noted on the plans. All temporary casing shall be removed during placement of concrete unless otherwise noted on the plans. Should the Contractor be unable to remove the temporary casing, the Contractor shall pressure grout the annular space between the casing and soil. Materials and methods for grouting operation shall be submitted to the Engineer for approval for the grouting operation at no additional cost to the Division.

625.4.4 – CSL Testing Tubes: Tubes required for CSL Tests shall be ASTM A53, Grade B, nominal 2 inch (50 mm) diameter. Hydrostatic test requirements are waived. Threaded Couplings shall be used per ASTM A 865.

625.5 – CONSTRUCTION:

625.5.1 - General: The following sequence describes a generalized construction method that is expected to be appropriate for the installation of the drilled caissons. Deviations will be permitted with the Engineer's approval.

625.5.1

- a) Excavate to top of shaft elevation.
- b) Drilling of a “Preinstallation Core Hole” prior to drilling of caisson hole. The drilling and sampling of the preinstallation core holes shall be done by use of double tube core barrels. Additional preinstallation core holes in other locations may be required where directed by the Engineer. Such additional core holes shall be paid for at the contract unit bid price. The preinstallation core hole will be drilled at the bottom of the rock socket, downward a distance equal to the caisson diameter below the expected bottom of rock socket. Its purpose is to assure that the rock just below the socket is sound and able to carry the loads that will be imposed on it. A preinstallation core hole is a 2 inches (50 mm) nominal diameter hole, with coring, where the quality of the rock core and the rate of drilling are used to determine if there is satisfactory rock of sufficient type and thickness, and to locate the presence of open joints, voids, soft rock or other deleterious material. Logs of the core hole shall be provided to the Engineer within 24 hours of completion of coring. All cores shall be maintained by the Contractor until completion of the project and shall then become the property of the Engineer.
- c) Drilling of cased hole through the soil overburden down to top of competent rock. Sealing bottom of casing if necessary to prevent entry of ground water.
- d) Drilling of rock socket to the minimum diameter shown in the plans and to a depth shown on the drawings or otherwise directed by the Engineer.
- e) Cleaning of the drilled hole, particularly the rock socket and the inside face of the casing; inspection of the hole and approval for placement of the caisson material.
- f) Placement of the pre-assembled cage of reinforcing steel and securing it in place against movement during concreting and during casing withdrawal. It also must be secured in such a way that the minimum clear cover over the bars is maintained. Placement of tubes as required for CSL testing.
- g) Placement of concrete in either dry or wet conditions. In the case of dry conditions, concrete placement shall be by the free-fall method with the concrete carefully directed down the center of the caisson without striking the casing, the reinforcing steel, the CSL tubes or the sides of the rock socket. In the case of wet conditions, concrete placement shall be by tremie or pumping with the mix adjusted

accordingly. If the temporary casing is to be removed it shall be withdrawn carefully and slowly so as not to leave any voids in the concrete and so as not to dislocate any reinforcing steel. Any concrete not meeting this specification's slump requirements shall be rejected.

- h) For any parts of any caisson that extend above either the existing or permanent grade, that portion shall be placed by use of forms of the diameters shown in the plans. Curing, stripping, and finishing shall be the same as for other structural concrete. Casing may be used as forms.
- i) Turning the site over to the Engineer for CSL testing if required. Cooperation with the Engineer in the conduct of the testing, as specified herein. Corrective measures for any unacceptable caissons. Removal of water from the CSL tubes and filling with an approved grout. All core holes must be filled with an approved grout.

625.5.2 - Excavation:

625.5.2.1 - Scope: All excavation of the foundations in which drilled caissons are to be constructed shall be completed down to the bottom of the footing before caisson construction begins, unless otherwise authorized by the Engineer. The Contractor shall drill one core hole at each caisson location. The Contractor shall perform all excavations required for the caissons and the rock sockets, through whatever materials are encountered, to the dimensions shown in the plans, or required by the site conditions, or directed by the Engineer. The Contractor shall make each caisson excavation available to the Engineer for inspection, providing tools, equipment, and safety measures as hereinafter specified. Upon direction of the Engineer, the Contractor will drill preinstallation core holes. Based on preinstallation core hole information or on general inspection of the rock socket, the Contractor shall drill the rock socket deeper if directed by the Engineer.

625.5.2.2 - Excavation through Overburden: Unless otherwise shown in the plans, drilled caisson excavations in the overburden shall be vertical bored holes extending from the ground surface down to the surface of competent rock. Temporary or permanent casings will be required down to the competent rock surface and shall be seated in rock in a manner that prevents caving and prevents the entry of ground water. In the event of a groundwater condition, appropriate measures shall be taken subject to the Engineer's approval. Such measures may include pumping from within the excavation, external dewatering, or excavation through a slurry-filled hole until the casing can be seated and sealed. In cases in which the water is difficult to control, the Engineer may permit wet excavation which could require later inspection by diving methods and would require later

625.5.2.3

placement of concrete by underwater methods.

625.5.2.3 - Excavation in Rock: Rock sockets shall be excavated to the dimensions and depths shown in the plans, forming a flat bearing area at the bottom of the socket. Each socket shall be excavated into continuous rock for the indicated length, by use of methods subject to the Engineer's approval. Blasting methods will not be permitted.

Upon completion of each rock socket excavation, the Engineer may (1) accept the socket, or (2) order deeper excavation based upon preinstallation core hole data or general inspection of the socket. The adequacy of each socket will depend on the soundness of its bottom surface and on the soundness of its underlying layers. The Contractor shall drill required preinstallation core holes as directed and shall excavate sockets to the depth directed by the Engineer.

Contractor is cautioned not to over-drill the rock sockets. Unauthorized over-drilling will be at the Contractor's expense. In the case where over-drilling would bring the caisson base too close to a coal seam or other weak layer, then drilling must be extended through such weak layer, at the Contractor's expense, to a satisfactory deeper bearing level as determined by the Engineer.

No portion of the rock socket shall be exposed to drilling fluid or groundwater for more than 96 hours. Any portion of the rock socket exposed to drilling fluid or water for more than 96 hours, and any portion of the rock socket which, in the opinion of the Engineer, has deteriorated due to exposure to air or water, shall be reamed with an approved grooving tool to a depth of not less than ¼ in. (6 mm), or as directed by the Engineer. Reaming of the socket, if necessary, is considered incidental to the cost of drilling the rock socket, and no separate payment will be made for this work.

625.5.2.4 - Providing for Socket Inspection: Upon completion of the excavation of each rock socket, and upon thorough cleaning of the socket, the Contractor shall make the socket available to the Engineer for inspection. The Contractor shall provide suitable access for inspection, electric lighting, devices for checking dimensions, alignment and plumbness, ventilation equipment, the protective cage, radio communication, and auxiliary safety line. The air in the caisson shall be tested for noxious and/or explosive gases prior to and during entry of inspection personnel, to assure a safe working environment.

625.5.2.5 - Disposal of Materials: Disposal of excavated materials shall be accomplished under the general provisions of Section 207.6 of the Standard Specifications.

625.5.2.6 - River Area: Drilled caisson construction in the river shall employ whatever special methods the Contractor finds necessary for access and for accomplishing the work. These methods may include cofferdams, temporary sand islands, or other suitable measures. The Contractor will be responsible for conforming to all regulatory and environmental requirements related to the river, and for obtaining any permits that are required by his river operations.

625.5.2.7 - Safety Measures: Safety of all persons is to be considered an objective of the utmost importance on this project. Therefore, the Contractor will take whatever measures are necessary to protect his own personnel, his subcontractors' personnel, the Engineer or other agents of the state, regulatory personnel, and others including the general public. The following list is presented as representative of issues that the Contractor must address. It is not intended as all-inclusive and does not relieve the Contractor of conforming to other regulations, laws, requirements, or other measures reasonably required for safe excavating operations. The Contractor shall develop a safety plan in accordance with these requirements and provide this plan to the Engineer for his review.

- a) Any required equipment within an excavation shall be operated by air or electricity. The use of gasoline-driven engines or diesel engines within an excavation will not be permitted. All lighting shall be electric and precautions shall be taken in regard to potential short circuits of electric current within ground water.
- b) The Contractor will take precautions to assure that no explosive or noxious gases are present. Fresh air shall be supplied into the excavation and foul air shall be removed whenever any personnel are present in the hole.
- c) A safety harness or chair lift, with separate safety line, protective cage, and two-way radio communication shall be used for any entry into an excavation.
- d) No open excavation shall be left unattended. During non-working hours excavations shall be protected by the use of solid, safe covers that are firmly fastened in place.

625.5.3 - Reinforcing Steel Installation: Prior to installation of reinforcing steel, the steel cage shall be checked and cleaned of any materials that would tend to prevent bonding. The excavated hole shall also be checked and any remaining or newly deposited debris shall be removed. Immediately upon the Engineer's approval of the condition of the cage and his acceptance of the socket, and just prior to placement of concrete, the fully assembled cage of reinforcing steel shall be installed into the excavation.

The cage will consist of longitudinal (vertical) bars, spiral or tie bars, cage stiffener bars as required, spacing devices, and any other appurtenances required to maintain alignment, shape, and clearances. Cages shall include steel tubes in shafts where CSL testing is to occur. Each cage shall be placed in one unit by lowering into the hole in a manner that will prevent distortion. Concrete spacers or other approved noncorrosive spacing devices shall be used at sufficient intervals (near the bottom and at intervals not exceeding 10 ft (3 000 mm) along the caisson) to ensure concentric spacing for the entire cage length. The minimum

625.5.4

number of centering devices at each level shall be three. All steel centering devices shall be epoxy coated. The cage shall be supported from the top by use of a ground surface frame or other positive means. Setting the cage on the socket bottom without support will not be permitted.

All intersections of drilled caisson reinforcing steel shall be tied with cross or “figure 8” ties. The reinforcing steel in the caisson shall be 100% tied and supported so that the reinforcing steel will remain within allowable tolerances for position. Unless otherwise shown in the plans, splicing shall be by mechanical connectors or couplers which develop at least 125% of yield strength of the reinforcing bar. No more than 50% of the longitudinal reinforcing shall be spliced within 60 bar diameters of any lapped splice location or within 2 ft (600 mm) of any mechanical splice or coupler location. Cage stiffener bars shall be used as required to provide a reinforcement cage of sufficient rigidity to prevent racking, permanent deformations, etc. during installation. If the concrete is to be placed by the free-fall method, these bars must first be removed.

In the event that the caisson has been excavated below the anticipated tip elevation, the reinforcing cage may be extended at the tip (low) end by lap splices, mechanical connectors, or welded splices in conformance with the Standard Specifications. In this instance, splices need not be staggered and 100% of the reinforcing bars may be spliced at a given location. Lap splice lengths shall be as shown in the plans or approved by the Engineer.

Prior to placing the reinforcement cage, the Contractor shall demonstrate to the satisfaction of the Engineer that the fabrication and handling methods to be used will result in a reinforcing cage placed in the proper position, with the proper clearances, and without permanent bending or racking of the reinforcement cage.

The elevation of the top of the steel cage shall be checked before and after the concrete is placed. If the rebar cage is not maintained within the specified tolerances, corrections shall be made by the Contractor to the satisfaction of the Engineer. No additional caissons shall be constructed until the Contractor has modified his rebar cage support system in a manner satisfactory to the Engineer.

625.5.4 - Placement of Concrete: Prior to concrete placement, the Contractor shall make all necessary arrangements to assure the uninterrupted delivery of concrete so that there will not be any cold joints in the caissons. Placement of concrete shall generally conform to the applicable portions of Section 601.10 of the Standard Specifications. The rate of placement of concrete, as related to the height of fresh concrete at any time, will be subject to the Engineer's approval. The placement method will be developed by the Contractor, taking account of set time, hydraulic pressures and casing removal.

The placement of concrete in **dry conditions** shall be by a free-fall method. The height of free fall is not limited, but segregation of the concrete is not permitted. In order to qualify as a dry condition the caisson excavation must meet two requirements. The first requirement is the infiltration rate shall not exceed 3 in. (75 mm) of depth per hour as measured in the bottom 18 inches (450 mm) of the rock socket. The second requirement is that at the time of concrete placement the depth of water in the bottom of the rock socket shall not

exceed 2 in. (50 mm). The dry concrete placement method may be used only when the sides and the bottom of the caisson excavation remain stable without detrimental caving, sloughing or swelling, and water can be satisfactorily removed prior to inspection and prior to placing concrete.

In a case where the Engineer determines that dry conditions cannot be attained, he will require placement by the wet placement method shown in the approved Installation Plan. The casing shall be filled with clean water to an elevation not less than 4 feet (1 200 mm) above the water elevation outside the casing, to provide a positive water pressure inside the casing. Concrete will then be placed by conventional tremie or pumping methods. Tremie or pump placement methods shall not utilize aluminum parts which would be in contact with the concrete.

Tremies used to place concrete shall consist of a tube of sufficient length, weight, and diameter to discharge concrete at the caisson base elevation. The tremie inside diameter shall not be less than 10 inches (250 mm). The inside and outside surfaces of the tremie shall be clean and smooth to permit both flow of concrete and unimpeded withdrawal during concreting. The wall thickness of the tremie shall be adequate to prevent crimping or sharp bends which restrict concrete placement.

The tremie used for concrete placement shall be watertight. Concrete placement shall not begin until the tremie is placed at the caisson base elevation. Valves, bottom plates, or plugs may be used only if concrete discharge starts within approximately 2 inches (50 mm) above the excavation bottom. Plugs shall either be removed from the excavation or be of a material approved by the Engineer which will not cause defects in the caisson if not removed.

The discharge end of the tremie shall be constructed to permit the free radial flow of concrete during placement operations. The tremie discharge end shall remain at or near the bottom of excavation as long as practicable during concrete placement. The tremie discharge end shall remain immersed as deep as practicable in the concrete, consistent with the Contractor's construction methods, and shall be immersed at least 10 ft (3 000 mm) in concrete at all times after starting the flow of concrete. The flow of the concrete shall be continuous. The concrete in the tremie shall be maintained at a positive pressure differential at all times to prevent water or slurry intrusion into the caisson concrete.

All pump lines shall have a minimum diameter of 5 inches (125 mm) and shall be constructed with watertight joints. Concrete placement shall not begin until the pump line discharge orifice is at the caisson base elevation. A plug or similar device shall be used to separate the concrete from the fluid in the hole until pumping begins. The plug shall either be removed from the excavation or be of a material approved by the Engineer which will not cause a defect in the caisson if the plug is not removed. The discharge orifice shall remain at least 10 ft (3000 mm) below the surface of the fluid concrete.

If at any time during the concrete pour, the tremie line orifice or the pump line orifice is removed from the fluid concrete column and discharges concrete above the rising concrete level, the entire drilled caisson shall be considered defective. In such case, the Contractor shall remove the reinforcing cage and

625.5.5

concrete, complete any necessary sidewall removal directed by the Engineer and repour the caisson. All costs of replacement of defective caissons shall be the responsibility of the Contractor and shall be at no cost to the Department.

After the concrete level has reached the required top elevation, it will be forced to overflow in the case of tremie or pump placement, leaving only fresh, uncontaminated concrete. In the case of placement by free fall (dry conditions), the concrete will be continued high enough to compensate for any settlement due to removal of casing.

The top 10 ft (3 000 mm) of each drilled caisson shall be vibrated except, when more than 10 ft (3 000 mm) is to be exposed above the ground line or the riverbed, then the entire exposed portion shall be vibrated. Exposed portions of each drilled caisson shall be cured in accordance with Section 601.12 of the Standard Specifications.

625.5.5 - Removal of Casing: Removal of the casing from a shaft may occur gradually as concrete is placed. In all cases, extraction of casing shall begin within one hour from the beginning of concrete placement in the cased portion of the shaft. Insofar as possible, casing extraction shall be done at a slow uniform rate by application of a steady vertical upward pull in the direction of the axis of the shaft. To facilitate extraction, tapping on the casing, exertion of temporary downward pressure, and slight rotation will be permitted, but care must be taken to avoid harmful impacts or disturbances to the fresh concrete. Vibration or rodding may not be used to break the casing loose for extraction.

If, during extraction of casing, upward movement of concrete and/or reinforcing steel occurs, the Engineer shall be notified immediately. If he considers the movement to be minor, he may permit the extraction of the casing to continue. If, however, the movement is deemed significant and indicative of squeezing of the surrounding soil thus resulting in a reduction of the caisson diameter, then he may order the casing to be left in place, or he may permit extraction to proceed and order a later non-destructive load test, or may order other procedures as appropriate at no additional cost to the Division.

For the upper portions of drilled caissons that will be exposed and visible, the casing may remain in place as a form until the concrete has attained a strength that enables it to stand alone without further deformation. Casing shall then be removed.

625.6 - INSPECTION OF SOCKETS:

625.6.1 - Depth of Rock Socket: Each rock socket shall be drilled to the shaft diameter shown in the plans unless otherwise directed by the Engineer based on subsurface conditions encountered.

The top elevation of competent rock must be confirmed as the socket drilling is started. The effective "top elevation" is based on observation of the boundary zone where broken or weathered rock becomes competent rock, and is also influenced by the presence of any shale or coal seams. Based on that elevation, and the information from the preinstallation core hole, the Engineer will

determine the final depth of socket and bottom elevation. The drilled rock socket will then be inspected per 625.5.2.3 and will either be accepted or drilled deeper as determined by the Engineer.

625.6.2 - Inspection Under Water: In a case where it is considered unfeasible to dewater a caisson, the Contractor shall provide drilled caisson logs and screenings to the Engineer for evaluation. If this material is not sufficient for a proper judgement, the Engineer will reserve the right to order an inspection by diving or other methods either through a separate specialty subcontractor or through the Contractor in which case compensation would be under Sections 104.3 and 109.4 of the Standard Specifications. Any time required for inspection under water will be considered incidental to the work and will not be cause for extra compensation related to a claim or extension of contract time.

625.7 - METHOD OF MEASUREMENT:

Drilled caissons and Rock Socket foundations will be measured by the linear foot (meter). Drilled Caissons are the portion from the finished top of each caisson to the top of competent rock. Rock Socket is the portion from the top of competent rock to the bottom of the caisson as shown in the plans or as directed by the Engineer. Each measured caisson is to be complete in place, accepted, and ready to function. "Top of caisson" is the top of concrete as shown in the plans. "Top of competent rock" is as tabulated in the drilled shaft schedules in the plans unless a difference of one 1 foot (300 mm) or more is found during drilling.

Drilled Caisson test hole will be measured in Lump Sum basis. Preinstallation core hole shall be measured by the linear foot (meter) based upon actual length drilled.

625.8 - BASIS OF PAYMENT:

The accepted quantities of drilled caisson foundations, measured as provided above, will be paid for at the contract unit price per linear foot (meter); complete in place including excavation, slurry if required, temporary or permanent metal casing, steel reinforcing, concrete, curing, and any required forming and finishing. No additional payment will be made for temporary casing that remains in place and pressure grouting due to the Contractor's inability to stabilize a drilled excavation, for the need to place concrete by tremie or pumping, for the need to use slurry for drilling, or for extra excavation and concrete that may be required due to drilling diameters larger than the minimum diameters specified. No additional payment will be made for methods employed to gain access to drilled caisson construction or for means required to provide a dry working environment within the drilled caissons. Tubes for CSL testing, other responsibilities related to testing and inspection assistance are incidental, with no separate payment being made.

Drilled caisson test holes will be paid for at the contract lump sum price for each such hole.

Preinstallation core hole will be paid for by the linear foot (meter).

625.9 - PAY ITEMS:

ITEM	DESCRIPTION	UNIT
625001-*	DRILLED CAISSONS " <u>D</u> " DIAMETER	LINEAR FOOT (METER)
625003-*	" <u>D</u> " ROCK SOCKET FOUNDATION	LUMP SUM
625004-*	" <u>D</u> " DRILLED CAISSON TEST HOLE	LUMP SUM
625005-*	PREINSTALLATION CORE HOLE	LINEAR FOOT (METER)

* Sequence number

D = Diameter of drilled caisson, in inches (millimeters)

SECTION 626 RETAINING WALL SYSTEMS

626.1 - DESCRIPTION:

This work shall consist of furnishing the design, wall construction plans, materials, and construction of cast-in-place reinforced concrete or Mechanically Stabilized Earth (MSE) walls in accordance with these specifications and in reasonably close conformity with the lines, grades, design, and dimensions shown in the plans.

626.2 - GENERAL:

Unless specified otherwise in the contract documents the wall may be, at the Contractor's option, any one of the wall systems on the approved vendor list corresponding to the applicable pay Item. The approved Vendor Lists are available through the Materials Section of the Contract Administration Section.

The Contractor shall indicate which wall system is to be constructed by the bid alternative chosen in the proposal. No change of the wall system indicated in the bid proposal shall be permitted after the bid opening unless approved by the Engineer.

The wall design and detail plans for construction shall be submitted to the Engineer for approval. The time required for preparation and review of these submittals shall be charged to the allowable contract time. Delays caused by untimely submittals or insufficient data will not be considered justification for time extensions. No additional compensation will be made for any additional material, equipment, or other items found necessary to comply with the project specifications as a result of the Engineer's review. The proposed wall design shall be compatible with the Contractor's proposed method of construction, and shall be compatible with any method of construction shown in the plans. The Division does not assume nor warrant any wall system's compatibility with any particular construction methods.

626.3 - DESIGN CRITERIA:

626.3.1 - General: The size of all structural elements shall be determined such that the design load stresses do not exceed the allowable

stresses found in the AASHTO LRFD Bridge Design Specifications, latest edition.

Analysis of external stability of the in-place retaining wall system will be the responsibility of the Division. Any staged or temporary construction affecting wall stability shall be the responsibility of the Contractor.

The parapets on any portion of the retaining walls as shown in the plans shall be designed to resist traffic loads in accordance with the AASHTO LRFD Bridge Design Specifications, latest edition.

626.3.2 - Mechanically Stabilized Earth: The design for the MSE wall shall consider the internal stability of the wall mass. The design shall conform to the requirements found in AASHTO LRFD Bridge Design Specifications, latest edition.

External loads, which affect the internal stability such as those, applied through piling, bridge footings, temporary construction, etc. shall be accounted for in the design. A design life of 100 years shall be used throughout the design. The factor of safety for pullout resistance shall not be less than 1.50 based on pullout resistance at $\frac{3}{4}$ inch (19 mm) deflection.

The allowable bearing pressure under the stabilized mass shall be as shown in the plans. The minimum length of the soil reinforcing system, as measured from the back of the front face to the end at the back of the soil stabilized mass, shall be as shown in plans, and shall be the same from top to bottom of the wall at any cross section.

All appurtenances behind, in front of, under, mounted upon, or passing through the wall such as drainage structures, utilities, or other items shown in the plans must be accounted for in the design of the wall.

626.3.3 - Cast-in-Place Reinforced Concrete: When a Cast-in-Place Reinforced Concrete option is included in the plans the following shall be applicable.

The information shown in the plans for the cast-in-place alternative is schematic; however, all dimensions shown in the plans shall be considered minimums.

The allowable bearing pressure of the foundation soils, the unit weight of the retained soils, and the characteristics of the retained soils necessary for design purposes shall be as shown in the plans.

626.4 - SUBMITTALS:

626.4.1 - General: The Contractor shall submit complete design calculations, explanatory notes, and detail plans for the proposed wall system. The detail plans shall include all details, dimensions, quantities, and cross sections necessary to construct the wall and shall include but not be limited to the following items:

626.4.1

A plan and elevation sheet or sheets for the wall which shall contain the following:

1. An elevation view of the wall which shall indicate the elevations at the top of the wall at all horizontal and vertical break points and at least every 50 ft. (15 m) along the face of the wall, all steps in the footings or leveling pads, the original and final ground lines, the maximum bearing pressures, and the summary of quantities for each wall.
2. A plan view of the wall which shall indicate the offsets from the construction centerline to the face of the wall at all changes in horizontal alignment and the centerline of any drainage structure or drainage pipe behind, passing through, or under the wall.
3. A typical cross section or cross sections showing elevation relationship between existing ground conditions and proposed grades.
4. All general notes required for constructing the wall. The required batter to compensate for the elongation of the soil reinforcing during erection shall be shown for each different required height.
5. All horizontal and vertical curve data affecting the wal.
6. All details for footings or leveling pads shall be shown including details for steps in the footings or leveling pads.
7. All details for construction of walls with appurtenances behind, under, mounted upon, or passing through the wall such as drainage structures or utilities shall be clearly indicated.
8. Required architectural treatments shall be as indicated and as detailed in the plans. All details for any required architectural treatments shall be shown including:
9. Product data and installation instructions for manufactured form systems, form liners, release agents, ties, and accessories. The release agent manufacturer shall certify that the products supplied comply with regulations controlling the use of volatile organic compounds (VOC's).
10. Shop drawings for fabrication and erection. These drawings shall show all items that visually affect the exposed concrete, including, but not limited to, general form construction, jointing, specially formed joints or reveals, and patterns of placement. The Engineer's review will be for general architectural applications and features only. Formwork design for structural stability and sufficiency is the Contractor's responsibility and shall not be submitted for the Engineer's review.

11. The wall manufacture shall submit copies of their Quality Assurance/Quality Control Manuals on each project.
12. Mockup or Sample Panels. The Contractor shall construct a mockup or sample panel using the proposed formwork and facing materials in order to demonstrate the required finishes and textures. Actual construction of concrete shall not proceed until the Engineer has accepted the sample units.

At the time the detail plans are submitted for review, they shall be accompanied by design calculations and explanatory wall notes. These documents shall be legible and shall demonstrate that the design criteria have been met. Specified minimum factors of safety and the maximum soil pressure beneath the wall footing or earth stabilized mass shall be clearly indicated.

The plans shall be prepared on reproducible sheets 22 x 34 inches (550 mm x 850 mm) including borders. Each sheet shall have a title block in the lower right hand corner. The title block shall include the sheet number of the drawing, name or designation of the wall, the project designation, and the Contractor. Design calculations and notes shall be prepared on sheets 8½ x 11 inches (216 mm x 280 mm), and shall contain the project designation, wall designation, date of preparation, initials of designer and checker, and page number at the top of the page. The Detail Plans, Design Calculations, and Explanatory Notes shall be signed and stamped by a Professional Engineer registered in West Virginia and knowledgeable in the proposed alternative wall system.

The initial submission shall include three sets of the detail plans, calculations, and notes. One set of notes and plans will be returned to the Contractor with any indicated corrections. When the plans and notes are stamped approved by the Engineer, the Contractor shall furnish the Engineer with the requested number of sets of prints and a Mylar set of the plans for distribution by the Division. The Contractor shall perform no work or ordering of materials for the structures until the Engineer has approved the submittal.

626.4.2 - Mechanically Stabilized Earth: The details and material specifications for the wall panels and incidental accessories shall be included with the detail plans for approval by the Engineer.

The designation as to the type of panel, the length of the soil reinforcing systems, the distance along the face of the wall where changes in lengths of the soil reinforcing systems occur, and the limit of widest mesh, strip, or anchor shall be clearly shown in the plans.

All wall panels shall be detailed. The details shall show all dimensions necessary to construct the element, all reinforcing steel in the element, and the location of soil reinforcing system devices embedded in the panels.

626.4.3 - Cast-in-Place Reinforced Concrete: The plans for the cast-

626.5

in-place wall shall contain a complete reinforcing bar schedule showing all bending details and bar marks. The plans shall also show the location of all construction joints, expansion joints, or other joints in the wall. All wall thickness shall be shown and transition details at wall thickness changes.

626.5 - MATERIALS:

626.5.1 - Mechanically Stabilized Earth Components: The Contractor shall make arrangements to purchase the facing elements, reinforcing mesh or strips, attachment devices, joint materials, and all other necessary components. Materials not conforming to this section of the specifications or from sources not listed in the contract documents shall not be used without written consent from the Engineer.

626.5.1.1 - Reinforced Concrete Facing Panels: The panels shall be fabricated in accordance with Section 601 of the Standard Specifications with the following exceptions and additions:

- A. Concrete for the precast facing panels shall attain a minimum compressive strength of 4,000 psi (27 Mpa) at 28 days. All concrete shall have air entrainment of 7 % plus or minus 2.5 % with no other additives. Specified concrete properties are to be tested in accordance with applicable provision of Section 601.4.1 of the Standard Specifications. Acceptance of a Production LOT will be made if the compressive strength test result is greater than or equal to, 4,000 psi (27 Mpa). A Production LOT is defined as a group of panels that will be represented by a single compressive strength sample and will consist of a single day's production. A minimum of two cylinders shall be required for every compressive strength sample.
- B. The units shall be fully supported until the concrete reaches a minimum compressive strength of 1,000 psi (9.7 Mpa).
- C. Unless otherwise indicated in the plans or elsewhere in the specifications, the concrete surface for the front face shall have a Class 1 finish as defined by Section 601.11 and a uniform surface finish for the rear face. The rear face of the panel shall be screeded to eliminate open pockets of aggregate and surface distortions in excess of ¼ inch (6 mm). The panels shall be cast on a flat area. The clevis loops, tie strip guide, or other galvanized devices shall not contact or be attached to the face panel reinforcement steel.
- D. The date of manufacture, the production LOT number, and the piece mark shall be clearly scribed on an unexposed face of each panel.

E. All units shall be handled, stored, and shipped in such a manner as to eliminate the dangers of chipping, discoloration, cracks, fractures, and excessive bending stresses. Panels in storage shall be supported in firm blocking to protect the panel connection devices and the exposed exterior finish.

F. All units shall be manufactured within the following tolerances:

1. Panel Dimensions: Position of panel connection devices within 1 in. (25 mm), except for coil and loop embeds which shall be 3/16 inch (5 mm) . All other dimensions within 3/16 inch (5 mm) .
2. Panel Squareness: Squareness as determined by the difference between the two diagonals shall not exceed ½ in. (13 mm).
3. Panel Surface Finish: Surface defects on smooth formed surfaces measured over a length of 5 feet (1.5 m) shall not exceed ¼ in. (6 mm). Surface defects on the textured-finished surfaces measured over a length of 5 feet shall not exceed 5/16 in. (8 mm).

Units shall be rejected because of failure to meet any of the requirements specified above. In addition, any or all of the following defects shall be sufficient cause for rejection:

1. Defects that indicate imperfect molding.
2. Defects indicating honeycombed or open textured concrete.
3. Cracked or severely chipped panels.
4. Color variation on front face of panel due to excess form oil or other reasons.

All reinforcing steel shall be in accordance with Section 602 of: the Standard Specifications.

626.5.1.2 - Soil Reinforcing and Attachment Devices: All reinforcing and attachment devices shall be carefully inspected to insure they are true to size and free from defects that may impair their strength and durability.

Cutting of reinforcing strips or mesh at vertical obstacles, shall not be permitted. Care must be taken to avoid damage to the galvanized coating during handling, storing, and shipping.

The following requirements shall apply to all soil reinforcing and attachment devices.

A. Reinforcing strips shall be hot rolled from bars to the required shape and dimensions. Their physical and mechanical properties shall conform to ASTM A-36 (AASHTO M-183) or equal. Galvanization shall be required and shall conform to the minimum requirements of ASTM A-123 (AASHTO M-111).

B. Reinforcing mesh shall be shop fabricated of cold drawn steel wire

626.5.1.3

conforming to the requirements of paragraph one of Section 709.4. Galvanization shall be applied after the mesh is fabricated and shall conform to the minimum requirements of ASTM A-123 (AASHTO M-111).

- C. The tie strips shall be shop fabricated of a hot rolled steel conforming to the minimum requirements of ASTM A-570, Grade 50 or equivalent. Galvanization shall be required and shall conform to ASTM A-123 (AASHTO M-111).
- D. Loop embeds shall be fabricated of cold drawn steel wire conforming to ASTM A-510, UNS G-10350 or ASTM A-82. Loop embeds shall be welded in accordance with ASTM A-185. Both shall be galvanized in accordance with ASTM B-633 or ASTM A-123 (AASHTO M-111).
- E. Bolts shall meet the requirements of ASTM A-325. Nuts shall meet the requirements of ASTM A-563 Grade DH or ASTM A-194 2H. Fasteners shall be galvanized in accordance with ASTM A-153.
- F. Connector pins and mat bars shall be fabricated from cold drawn steel conforming to ASTM A-82 and welded to the soil reinforcement mats as shown in the plans. Galvanization shall be required and shall conform to ASTM A-123 (AASHTO M-111).

626.5.1.3. - Joint Materials: Joint materials are to be installed to the dimensions and thicknesses in accordance with the plans or approved shop drawings, unless otherwise indicated:

- A. Provide either preformed EPDM rubber pads conforming to ASTM D-2000 for 4AA, 812 rubbers; neoprene elastomeric pads have a Durometer Hardness of 55 ± 5 ; or polyethylene bearing pads meeting the density requirements of ASTM D-1505 in horizontal joints between panels.
- B. Cover all joints between panels on the backside of the wall with a geotextile fabric that meets the requirements of Section 715.11.4 of the Standard Specifications. The minimum width and lap of the fabric shall be as follows:

Vertical and horizontal joints: 12”(300 mm) ; lap-4”(100 mm) .

626.5.1.4 - Acceptance: The Contractor shall furnish the Engineer a Certificate of Compliance certifying the above materials comply with the applicable contract specifications.

626.5.2 - Concrete Leveling Pad: All concrete used in the leveling pad shall as a Minimum conform to Section 601 of the Standard Specifications for

Class C Concrete.

626.5.3 - Select Granular Backfill

626.5.3.1- Test Requirements: All backfill material used in the structure volume shall conform to the following gradation limits as determined by AASHTO T-27:

Sieve Size	Percent Passing
4 inches (100 mm)	100
No. 40 mesh sieve	0 - 60
No. 200 mesh sieve	0 - 15

The backfill shall conform to the following additional requirements:

- A. The plasticity index (P.I.) as determined by AASHTO T-90 shall not exceed 6, or the material is described as non-plastic.
- B. The material shall exhibit an angle of internal friction of not less than 34 degrees, as determined by the standard Direct Shear Test, utilizing a sample of the material compacted to 95% of AASHTO T-99, Methods C or D (with oversized correction as outlined in Note 7) at optimum moisture content. No testing is required for backfills where 80% of sizes are greater than $\frac{3}{4}$ in. (19 mm).
- C. Soundness: The materials shall be substantially free of shale or other soft, poor durability particles. The material shall have a magnesium sulfate soundness loss of less than 30% after four cycles as determined by AASHTO T-104, or a sodium sulfate loss of less than 15% after five cycles as determined in accordance with AASHTO T-104.
- D. Electrochemical Requirements: The backfill materials shall meet the following criteria:

Requirements	Test Methods
Resistivity greater than 3,000 ohm Centimeters	AASHTO T-288
Ph 5-10	AASHTO T-289
*Chlorides less than 100 parts per million	AASHTO T-291
*Sulfates less than 200 parts per million	AASHTO T-290
Organic Content: 1% maximum	AASHTO T-267

* If resistivity is greater than 5,000 ohm-cm, the chlorides and sulfates requirements may be waived.

626.5.3.2 - Quality Control Testing: Quality control of the select granular material is the responsibility of the contractor as specified in 106.1.

The Contractor shall maintain equipment and qualified personnel to perform all sampling and testing necessary to determine the magnitude of the various properties of the material governed by the Specifications and shall maintain these properties within the limits of the Specifications.

626.5.3.3

The Contractor shall design a Quality Control Plan detailing the methods by which the Quality Control Program will be conducted. The plan prepared in accordance with the guidelines set forth in the appropriate portions of MP 307.00.50 and MP 717.04.21, shall be submitted to the Engineer at the preconstruction conference. The work shall not begin until the plan is reviewed for conformance with the contract documents.

626.5.3.3 - Sampling and Testing: Frequency of sampling and testing shall be in accordance with the Contractor's Quality Control Plan. The minimum frequencies for gradation and plastic limits shall be as stated in MP 717.04.21, Table D, for subgrade.

626.5.3.4 - Acceptance: The Contractor shall furnish certified test results that the select granular backfill meets the contract specifications. The test results for the select granular backfill shall not be used to verify compliance

performed at any time if the material changes. Additional tests for gradations and plastic limits shall be determined during the placement of the material.

Backfill placement shall closely follow erection of each course of panels. Backfill shall be placed in such a manner as to avoid any damage or disturbance of the wall materials or the Contractor at his expense shall correct misalignment or distortion of the wall facing panels due to placement of backfill outside the limits of this specification. At each reinforcement level, the backfill shall be placed to the level of the connection. Backfill placement methods near the facing shall assure that no voids directly beneath the reinforcing elements.

The backfill required to be placed in front of the wall, from the leveling pad to finished ground, shall be placed immediately after the Select Granular Backfill is above the first layer of Soil Reinforcing.

The maximum lift thickness after compaction shall not exceed 6 inches unless approved by the Engineer. The Contractor shall decrease this lift thickness, if necessary, to obtain the specified density.

Compaction within 3 feet (300 mm) of back face of the wall shall be achieved by at least three passes of a lightweight mechanical tamper, roller, or vibratory system.

At the end of each day's operation, the Contractor shall slope the last level of the backfill away from the wall facing to rapidly direct runoff away from the wall face. In addition, the Contractor shall not allow surface runoff from adjacent areas to enter the wall construction site.

Acceptance for compaction shall be on a LOT-by-LOT basis. A LOT shall be divided into five approximately equal sized sub-lots. A sub-lot shall consist of the quantity of material to backfill a single lift for 100 feet (30 m) of wall and at least one test per lift. One nuclear moisture and density measurement shall be made at a random location within each of the five sub-lots according to MP 207.07.20 for material having less than 40% retained on the $\frac{3}{4}$ in. (75 mm) sieve and MP 700.00.24 for material having 40% or more

retained on the $\frac{3}{4}$ in. (75 mm) sieve. The moisture tolerance shall be from optimum to two percentage points below optimum. The random locations shall be determined in accordance with MP 712.21.26. The target percentage of dry density shall be 95%. For applications where spread footings are used to support a bridge or other structural loads, the target percentage of dry density shall be 100%. If the results of five density tests on a LOT indicates that at least 80% of the material, in accordance with 106.3.1 (West Virginia AP-A), has been compacted to the specified target percentage of dry density, the LOT will be accepted. If less than 80 % has been compacted to the specified target percentage of dry density and/or the moisture content is outside the tolerance range, no additional material shall be placed until the LOT has been reworked to meet the specified requirements. Reworking and retesting shall be at the expense of the Contractor. When the Division performs the testing in the evaluation of reworked LOTs, the testing will be at the expense of the Contractor at the unit cost specified in 109.2.2.

The backfill material must compact to a stable condition. If the material is not stable under the weight of construction equipment, the contractor must correct the problem or replace the material even if test results indicate that the material meets the moisture and density specifications.

626.6 - CONSTRUCTION METHODS:

626.6.1 - Mechanically Stabilized Earth:

626.6.1.1 - Foundation Preparation: The foundation for the structure shall be graded level for a width equal to the length of reinforcement elements plus one (1) foot (300 mm) or as shown in the plans. Prior to wall construction, except where constructed on rock, the foundation shall be compacted with a smooth wheel vibratory roller. Any foundation soils found to be unsuitable shall be removed and replaced with select granular backfill as per Section 614.5.1.4 of these specifications.

626.6.1.2 - Wall Erection: A MSE wall supplier representative shall be present a minimum of three (3) days and as required thereafter during erection of the wall to assist the fabricator, contractor, and Engineer. The cost of the representative shall be considered incidental to the unit price of the MSE Wall System.

Precast concrete panels shall be placed so that their final position is vertical or battered as shown in the plans. Panels shall be handled by means of lifting devices connected to the upper edge of the panel. Panels should be placed in successive horizontal lifts in the sequence shown in the plans as backfill placement proceeds. As backfill material is placed behind the panels, the panels shall be maintained in position by means of temporary wedges or bracing according to the wall supplier's recommendations. The Contractor shall not have more than two levels of temporary wedges in place at any time during wall erection. Concrete facing vertical tolerances and horizontal alignment tolerances shall not exceed $\frac{3}{4}$ in. (19 mm). The overall vertical tolerance of the

626.6.1.3

wall (top to bottom) shall not exceed ½ in. (13 mm) per 10 feet (3 m) of wall height.

Reinforcement elements shall be placed normal to the face of the wall, unless otherwise shown in the plans. Prior to placement of the reinforcing elements, backfill shall be compacted in accordance with these Specifications.

626.6.1.3 - Backfill Placement: Backfill placement shall closely follow erection of each course of panels. Backfill shall be placed in such a manner as to avoid any damage or disturbance of the wall materials or misalignment of the facing panels or reinforcing element. Any wall materials that become damaged during backfill placement shall be removed and replaced at the Contractor's expense. The Contractor at his expense shall correct any misalignment or distortion of the wall facing panels due to placement of backfill outside the limits of this specification. At each reinforcement level, the backfill shall be placed to the level of the connection. Backfill placement methods near the facing shall assure that no voids exist directly beneath the reinforcing elements.

The moisture content of the backfill material prior to and during compaction shall be uniformly distributed throughout each layer. Backfill materials shall have placement moisture content less than or equal to the optimum moisture content. Backfill material with a placement moisture content in excess of the optimum moisture content shall be removed and reworked until the moisture content is uniformly acceptable throughout the entire lift.

The maximum lift thickness after compaction shall not exceed 1 ft. (300 mm). The Contractor shall decrease this lift thickness, if necessary, to obtain the specified density.

Compaction within 3 ft. (900 mm) of back face of the wall shall be achieved by at least three passes of a lightweight mechanical tamper, roller, or vibratory system.

At the end of each day's operation, the Contractor shall slope the last level of the backfill away from the wall facing to rapidly direct runoff away from the wall face. In addition, the Contractor shall not allow surface runoff from adjacent areas to enter the wall construction site.

626.6.2 - Cast-in-Place Reinforced Concrete:

626.6.2.1 - General: Except as otherwise shown in the plans or herein, construction methods for cast-in-place retaining walls shall comply with the Standard Specifications.

Construction methods for the following shall be per the indicated section of the Standard Specifications:

<u>Item</u>	<u>Section</u>
Unclassified Borrow Excavation	211
Structure Excavation	212

Wet Excavation	212
Rock Excavation	212
Select Material for Backfilling	212
Concrete	601
Reinforcing Steel	602

626.6.2.2 - Architectural Forms:

626.6.2.2.1 - General: Construct forms to sizes, shapes, lines, and dimensions shown, and as required to obtain accurate alignment, location, level, and plumb work in finished structures. Provide for openings, offsets, keyways, recesses, chamfers, blocking, screeds, bulkheads, and other as required.

Fabricate forms to prevent cement paste from leaking while placing concrete and for easy removal without hammering or prying against exposed concrete surfaces. Provide crush plates where stripping might damage cast concrete surfaces. Provide top forms for inclined surfaces where slope is too steep to place concrete. Solidly butt joints and provide backup material at joints to prevent leakage and fins. Assemble forms so that they may be easily removed without damaging exposed concrete surfaces.

Provide temporary form openings where inaccessible formwork interior can be cleaned and inspected before placing concrete. Place temporary form openings as inconspicuously as possible, consistent with project requirements.

When drilling forms used for exposed concrete, drill from the contact face to the outside to suit the ties used and to prevent leakage of concrete mortar. Do not splinter the forms by driving ties through improperly prepared holes.

Unless otherwise shown in the plans:

*provide sharp, clean corners at intersecting planes with no visible edges or offsets.

*provide accurately formed chamfered corners using $\frac{3}{4} \times \frac{3}{4}$ inch (19 x 19 mm) strips, surfaced to produce uniformly straight lines and tight edge joints.

626.6.2.2.2 - Form Coatings: Coat form contact surfaces with form-release agent before placing reinforcement. Do not allow excess material to accumulate in forms or to come into contact with reinforcement or surfaces that will be bonded to fresh concrete. Apply coating according to manufacturer's instructions.

Coat steel forms with non-staining, rust-preventative release agent, or otherwise protect from rusting. Rust-stained steel formwork is not acceptable.

626.6.2.2.3 - Reusing Forms: Split, frayed, delaminated, or otherwise damaged form-facing materials are not acceptable. Clean and apply a new form-release agent to concrete contact surfaces.

626.7 - METHOD OF MEASUREMENT:

626.7.1 - General: The unit of measurements shall be the gross area in square meters lying in a plane outside the front face of the structure as determined by the dimensions in the contract documents. . The gross area shall not include barriers, footings, or leveling pads. The gross area shall be the number of square meters established in the proposal, subject to adjustment as provided in Sections 104.2 and 109.2 of the Standard Specifications. No adjustment of pay quantity shall be allowed for changes in wall design to facilitate the Contractor's methods of construction of wall type.

Unless otherwise specified in the contract documents, items such as concrete barriers that are not part of normal retaining wall construction shall be measured separately for payment.

The quantity of earthwork shown in the plans does not include any work within the wall pay limits shown in the plans. Any adjustments to the required amount of embankment or select granular backfill due to the particular wall system proposed by the contractor shall be considered incidental to the project. No separate payment shall be made for increased embankment or increased select granular backfill requirements. The Contractor shall be responsible for any of the cost of changes in waste, borrow, or earthwork quantities from those shown in the plans caused by the requirements of the proposed wall system.

626.7.2 - Mechanically Stabilized Earth: The unit price shall include in place: concrete facing panels, soil reinforcing and attachment devices and associated hardware, coping and trim, or similar items that are normal parts of wall construction. No separate measurement of these items shall be made.

The unit price shall also include in place: all the following items shown within the wall pay limits in the plans: select granular backfill, excavation, embankment, foundation preparation, and leveling pads. No separate measurement of these items shall be made.

626.7.3 - Cast-in-Place Reinforced Concrete: The unit price shall include in place: concrete, reinforcing, joint materials, underdrains, weepholes, or similar items that are normal parts of wall construction. No separate measurement of these items shall be made.

The unit price shall also include in place: all the following items shown within the wall pay limits in the plans: select material for backfilling, excavation, embankment, and foundation preparation. No separate measurement of these items shall be made.

626.8 - BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract price per unit of measurement, respectively, for each pay item listed below and shown in the bid schedule, which prices and payment will be full compensation for the work prescribed in this section.

SECTION 631 ELECTRICAL WORK

631.1-DESCRIPTION:

This work shall consist of furnishing and installing electric motors, control panels, lighting systems, traffic control systems, conduits, and other electrical equipment and supplies in accordance with this Specification and as shown on the Plans.

631.2-MATERIALS:

The Contractor shall submit, in triplicate, an itemized bill of electrical equipment and materials, showing the rating, make, style, type, and catalog number of each item, which shall be approved by the Engineer before such equipment or materials are purchased or installed. The Contractor shall also submit for the approval of the Engineer, before beginning installation of conduit or electrical equipment, a complete wiring diagram for the work to be done, unless appropriate wiring diagrams are shown on the Plans. All equipment and materials shall meet the requirements of the National Electric Code and all local codes.

631.3-CONSTRUCTION METHODS:

All workmanship for electrical work shall be in accordance with the details shown on the Plans and with the requirements of the current National Electric Code in addition to any local codes as specified under Proposal Requirements.

631.4-METHOD OF MEASUREMENT:

Electrical work will be measured as a complete unit on a lump sum basis or in such units as indicated on the Plans, Proposal, or by Authorization.

631.5-BASIS OF PAYMENT:

Basis of payment will be the contract price bid for the item, which includes all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

631.6-PAY ITEMS:

632.1

SECTION 632 HORIZONTAL DRAINS

632.1-DESCRIPTION

This work shall consist of furnishing and installing plastic horizontal drains and associated plastic outlet pipes, in borings drilled into the faces of cuts, fills, and retaining walls. The installation shall be at locations and at angles as shown on the Plans or directed by the Engineer during construction and shall be in accordance with these Specifications. This work shall also consist of constructing terminal chambers, or collector pipes, when required, in accordance with these Specifications.

632.2-MATERIALS:

632.2.1 - Horizontal Drains: Horizontal drains shall be constructed of slotted and solid plastic pipe. The pipe shall consist of nominal 1½ inch I.D. Schedule 80, Type II PVC 2110 pipe conforming to the requirements of ASTM Designation D 1785.

The pipe shall have three rows of slots cut circumferentially in the pipe on the third points (120 degrees apart). The average configuration shall be from 22 slots, plus or minus one slot, per row per foot (300 mm) using 0.050 inch (1 mm) slots, to 46 slots plus or minus one slot, per row per foot (300 mm), using 0.010 inch (250 µm) slots. The number and width of slots will be as specified on the Plans or as approved by the Engineer depending upon the type of soil or rock. Perforated pipe shall not be used.

Solvent cement shall meet the requirements of ASTM D 2564.

632.2.2 - Terminal Chamber: Horizontal drain terminal chambers shall be constructed of 48 inch (0.109" Th.) (1200 mm (2.7 mm)) metallic coated corrugated steel pipe meeting the requirements of [713.2](#).

Concrete used for the chamber foundation and incidentals shall meet the requirements of [715.12](#).

Pipe used to drain the chambers shall meet the requirements of [714.22](#).

632.2.3 - Collector Pipes: Collector pipes, if any, shall be nominal 1½ inch unslotted or unperforated PVC pipe meeting the requirements of [714.22](#).

Fittings for collector pipes shall be rigid PVC, Type II, high impact fittings and shall be the solvent weld type. The fittings shall have a bursting pressure equal to or exceeding that of the pipe.

632.3 - GENERAL:

The Contractor shall provide a method to determine the end elevations of

all plastic horizontal drains. It shall be the Contractor's responsibility to control the drain elevations to avoid all utilities and drainage structures existing at the site.

632.4 - DRILLING:

The holes shall be drilled with approved rotary equipment capable of drilling three to six inch (75 to 150 mm) diameter holes through soil or rock formations or retaining walls to the lengths and angles designated on the Plans.

Steel drill casing with an expendable bit having a "J" slot adaptor on the first section, or an equivalent substitute, shall be used for drilling the hole.

632.5 - INSTALLATION OF HORIZONTAL DRAIN PIPE:

Prior to removing the casing, the slotted and solid section of the horizontal drain pipe shall be inserted. The end of the first section of the horizontal drain pipe inserted into each hole shall be plugged with an approved stopper. Each successive length of pipe shall be cemented to the previous section.

The last 10 feet (3 meters) of horizontal drain pipe, nearest the slope or wall face, shall be unslotted pipe.

Each drain shall be identified with a two inch by two inch (50 by 50 mm) or two inch (50 mm) diameter copper tag with the identification number stamped on the tag. The tag shall be permanently attached to the outlet end of the drain.

After all the horizontal drains are installed, bentonite pellets shall be thoroughly tamped or packed in the annuli to eliminate all voids between the drill hole and the plastic pipe. The Contractor shall pack the bentonite a minimum of 3 feet (900 mm) into each annulus as measured from the surface.

To verify this measurement a bulkhead must be fashioned around the pipe at a distance of three (3) (900 mm) from the surface. The bulkhead may consist of rope or other similar material i.e., oakum.

632.6 - TERMINAL CHAMBER INSTALLATION:

After the horizontal drains have been installed, the terminal chamber shall be constructed of metallic coated corrugated pipe meeting the requirements of 713.2, and placed at the locations and elevations shown on the Plans.

The metal portion of the chamber may be fabricated at the site or in the shop.

After the chamber is in place and the concrete has cured, the area around the chamber shall be backfilled, site graded to drain, seeded, and mulched, as directed by the Engineer. Before the backfill is placed around the horizontal drains and the chamber, the Contractor shall ensure the bentonite placed between the circumference of the drill holes and the drains is still properly placed. When directed by the Engineer, the Contractor shall place and compact more bentonite.

All bare metal and welded areas shall be thoroughly cleaned and painted with one coat of zinc rich paint meeting the requirements of 711.21.

The horizontal drains, installed at each horizontal drain terminal chamber

632.7

in location, shall be left in a condition that will ensure proper connections can be made to the finished chamber and that the water will be drained into and away from the chamber construction area.

632.7 - COLLECTOR PIPE INSTALLATION:

After the horizontal drains have been installed, the collector pipes shall be attached to the horizontal drains as shown on the Plans.

When a collector pipe system is required, the outlet ends of all horizontal drains shall be connected to the collector pipe by means of approved fittings; i.e., tees, plugs, street ells, etc.

632.8 - METHOD OF MEASUREMENT:

The quantity of work done for "Horizontal Drains" will be measured in linear 3 (meters) of pipe, which measurement will include the actual length of drain pipe, and outlet pipe, complete in place and accepted. The installation shall include the drilling, fittings, and bentonite.

The quantity of work performed in installing the horizontal drain terminal chamber and the furnishing of all materials necessary to complete the installation will be measured per each terminal chamber in place and accepted.

The quantity of work performed in installing the collector pipes will be measured per each for collector pipes, which will include the total length of all collector pipes and fittings; i.e., tees, plugs, street ells, etc., for each installation complete in place and accepted.

632.9 - BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the Contract unit bid price for the items below, which price and payment will be full compensation for drilling, site grading, seeding, and furnishing all materials and doing all the work prescribed in a workmanlike and acceptable manner, including all tools, equipment, supplies, labor and incidentals necessary to complete the work.

SECTION 633

CONCRETE GUTTER, INVERT PIPE GUTTER, OR DUMPED ROCK GUTTER

633.1-DESCRIPTION:

This work shall consist of the construction of open flow-ways for surface drainage, using concrete, dumped rock, or invert pipe sections of cast iron, corrugated metal, precast concrete, or vitrified clay, in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions, and cross sections shown on the Plans or established by the Engineer.

633.2-MATERIALS:

Materials shall conform to the following Subsections of Division 700, except as modified:

MATERIAL	SUBSECTION
Dumped Rock Gutter	704.4
Expansion Joint Material (Preformed)	708.1, 708.2
Joint Sealing Material	708.3
Reinforcing Steel	709.1, 709.4
Waterstops (Elastomer Materials)	708.10

Class B concrete for gutters shall meet the requirements of 601.

Invert pipe gutter shall be of the shape, size and materials shown on the Plans, conforming as nearly as practicable to the Specifications for whole pipe of similar radius and material.

CONSTRUCTION METHODS

633.3-GENERAL:

Excavation for all gutters shall be made to the required depth. For invert pipe and concrete gutters, the base upon which the gutter is to be constructed shall be compacted to a firm, even surface. All soft and unsuitable material shall be removed and replaced with suitable material which shall be thoroughly compacted. Where the location of any gutter falls on rock of a suitable nature, the Engineer may eliminate the gutter within the limits of the rock. When necessary, the rock shall be shaped to direct the flow of water back to the gutter beyond the limits of the rock.

633.4-CONCRETE GUTTER:

633.4.1-Forms: Forms shall be of wood or metal of sufficient strength to retain the concrete and shall be set and securely fastened in place, true to the lines and grades given.

633.4.2

633.4.2-Placing and Finishing Concrete: Class B concrete shall be placed and screeded true to profile and contour either by hand or machine methods. The surface finish shall be a wood float finish when placed by hand methods. When placed by machine method, the hand finishing shall be held to the minimum required to attain the Plan profile and cross section.

633.4.3-Joints and Cut-Off Walls: Expansion joints of the type and thickness specified on the Plans shall be installed at intervals not to exceed 50-ft unless otherwise shown. If adjacent to a pavement in which joints have been used, expansion joints shall be placed opposite those in the pavement. Contraction joints shall be provided at approximately 12½ ft. (4 meter) intervals. Contraction joints shall have a minimum depth of one-fourth of the specified gutter thickness plus ¼ in. (6 mm) tolerance, shall be ⅛ in. (3 mm) (nominal) in width, and shall be formed by using removable templates, scoring, sawing, or other methods approved by the Engineer. No filler material will be required for construction or contraction joints.

A concrete cut-off wall, reinforced as detailed on the Plans, shall be constructed at the beginning and at the end of each gutter and at locations designated on the Plans or by the Engineer. Cut-off walls shall be constructed at approximately 150 ft. (45 m) intervals along the gutter for grades 5 to 25 percent and at approximately 50 ft. (15 m) intervals for grades greater than 25 percent.

633.4.4-Curing: The concrete gutter shall be protected and cured by wetting for a period of three days after placing, or it shall be cured by white membrane curing materials in accordance with [501.14.4](#).

633.4.5-Waterstops: Waterstops shall be placed at all expansion joints in the gutter and where a concrete gutter abuts a proposed structure. Provisions shall be made to properly place the waterstop in the structure. In case of a concrete gutter which abuts an existing structure, a groove ¾ in. (20 mm) by 2 in. (50 mm) shall be left and filled with joint sealer. Waterstops shall conform to the requirements shown on the Plans.

633.5-INVERT PIPE GUTTER:

Sections of gutter of the type called for on the Plans, conforming to the segment of circular arc of the dimensions designated, shall be set in a manner conforming to the applicable requirements of [604](#), unless otherwise modified by the Engineer. If set in concrete, the base shall be of Class C concrete of the dimensions and sections shown and shall be cured as specified for concrete gutter.

633.6-DUMPED ROCK GUTTER:

Dumped rock gutter may be dumped from trucks and bulldozed into place in a manner similar to the placing of rock fill. Hand placement will not be required. The rock gutter shall be constructed to the thickness and grade shown

on the Plans. A thickness deficiency in excess of 10 percent will not be permitted.

The dumped rock gutter may be obtained from the unclassified excavation. If suitable material is not available from the unclassified excavation, it shall be the responsibility of the Contractor to furnish this material at no additional cost. Locations of probable sources for dumped rock gutter will be listed in the Plans.

633.7-METHOD OF MEASUREMENT:

The quantity of work done for "Concrete Gutter" will be measured in square yards (meters), complete in place and accepted, determined by the length, measured along the centerline, time the width. All measurements will be made on the surface of the gutter.

The quantity of work done for "Invert Pipe Gutter" will be measured in linear feet (meters), complete in place and accepted, measured along the centerline and upon the surface of the gutter.

The quantity of work done for "Dumped Rock Gutter" will be measured in cubic yards (meters), complete in place and accepted, determined by the dimensions shown on the Plans or established by the Engineer. No excess thickness will be measured for pay quantity.

Cut-off walls at the beginning and end of the concrete gutter, those cut-off walls constructed on steep grades (five percent or over) in accordance with these specifications and any other cut-off walls designated on the Plans will not be measured separately but will be included in the cost of the gutter. If additional cut-off walls are required by the Engineer during construction, they will be paid for as square yards (meters) of concrete gutter; the area will be measured on the vertical face of the cut-off wall and will be the area bounded by the lower extremity of the gutter and the sides and bottom of the wall.

633.8-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials, including reinforcing steel, expansion joint material, joint sealer, waterstops, concrete base for invert pipe gutter when called for on the Plans, and all labor, tools, equipment, supplies, and incidentals necessary to complete the work. The cost of all excavation will be paid for as "Unclassified Excavation".

633.9-PAY ITEMS:

SECTION 634

CONCRETE CRIBBING

634.1-DESCRIPTION:

This work shall consist of the furnishing and installing of precast concrete units to form a crib wall or similar structure, including the placing of interior and backfill material, in accordance with these Specifications and in reasonably close conformity to the lines, grades, dimensions, locations, and sections shown on the Plans.

634.2-MATERIALS:

Concrete shall be Class A, meeting the requirement of 601.

Joint mortar shall conform to 708.8.

Interior filling material shall conform to the requirements of select borrow as specified in 211. Shale or cinders shall not be used.

Reinforcing steel shall conform to 709.1 or 709.3.

The details of the crib members and their arrangements shall be as shown on the Plans. If manufactured on the Project, crib members shall be cured in accordance with 601. All members shall be free from depressions and spalled, patched, or plastered surfaces or edges, or any other defects which may impair their strength or durability. Cracked, untrue, or otherwise defective members will be rejected.

CONSTRUCTION METHODS

634.3-PLACING CRIB MEMBERS:

The prepared foundation bed for the cribbing shall be firm and normal to the face of the cribbing and will be approved by the Engineer before any of the crib work is placed. The crib members shall be erected as shown on the Plans. Care shall be taken to insure the correct alignment and batter on the crib wall. If a slight adjustment is needed, a shim made of shingles may be used.

Asphalt bearing pads having a thickness of ¼ in. (6 mm), and having a dimension of ½ in. (12 mm) greater than the bearing width in any direction, shall be placed between all bearing surfaces. When concrete cribbing is placed without batter, the asphalt bearing pads shall be eliminated and the cribbing members laid with a 1 to 2 cement mortar joint. The crib members shall be handled carefully, and members that become cracked or otherwise damaged shall be removed and new members substituted without extra compensation.

634.4-FILLING CRIB:

The filling of the interior and backfilling behind the crib shall progress simultaneously with the erection of the cribbing. The interior shall be filled with approved granular material. The space back of the cribbing shall be filled with suitable random material. All material shall be free of particles larger than 3 inches (75 mm), frozen lumps, wood or other extraneous material. All

material shall be placed in layers not exceeding 4 inches (100 mm) after compaction. This method of filling and compacting the interior and backfilling shall be continued until the embankment is level with the top of the structure, except, where the backfill is accessible to a roller, the backfill shall be compacted in accordance with 212.10. In any event, the greatest care shall be exercised in the placing and compacting of material between and back of the crib cells so that damage will not occur to the crib members.

The quality control testing and acceptance of the interior and backfill material will be according to the applicable sections of 207 and 716 or 717 with the following exceptions:

A lot will normally consist of the quantity of material required to fill the interior of the cribbing and backfill, except where the filling material and backfill material are different and in this case, each type of material would constitute a lot. For large installations, a lot should not exceed the quantity of material to fill or backfill 100 linear ft. horizontal and 20 ft. vertical. If either of these dimensions is exceeded, a new lot should be established.

The target percentage of density will be 95 percent, and each lot will have 5 density tests performed for quality control.

634.5-METHOD OF MEASUREMENT:

The quality of work done will be measured in cubic feet (meters) of "Concrete Cribbing", complete in place and accepted, determined by a tabulation of the number of pieces of each size and variety of separate members used, times the volume of the respective members calculated from their dimensions.

"Structure Excavation" will be limited to a plane 18 in.(450 mm) from and parallel to the faces of the cribbing.

634.6-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item below, which price and payment shall be full compensation for furnishing all the material and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work, except that the necessary structure excavation with limitations as specified above, will be paid for as Item 212001-*, "STRUCTURE EXCAVATION". The cost of asphalt bearing pads or joint mortar, granular filling of the interior, and backfilling behind the crib shall be included in the bid price for "Concrete Cribbing".

634.7-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
634001-*	CONCRETE CRIBBING	CUBIC FOOT (METER)

* Sequence number

SECTION 635 METAL CRIBBING

635.1-DESCRIPTION:

This work shall consist of the furnishing and installing of metal crib members, including the placing of the interior and backfill material, in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions, locations, and sections shown on the Plans.

635.2-MATERIALS:

The crib members shall consist of metallic headers and stretchers with the appurtenances necessary for complete assembly in the field. Each header and stretcher shall be fabricated completely in the plant prior to shipment to the site. If indicated on the Plans, fillers for placing between the stretchers on the face of the wall and end caps for the outside ends of the headers shall be furnished.

The sheets from which all headers and stretchers are manufactured shall be made of material meeting the requirements for chemical composition and spelter coating specified under 713.2 for corrugated iron or steel pipe.

The various members of the crib shall be constructed of metal having a minimum thickness of 0.064 in.(1.6 mm).

The details of the crib members and their arrangements shall be as shown on the Plans. Interior filling material shall conform to the requirements of select borrow in 211.

CONSTRUCTION METHODS

635.3-PLACING CRIB MEMBERS:

The prepared foundation bed for the cribbing shall be firm and normal to the face of the cribbing and will be approved by the Engineer before any of the crib work is placed.

The crib members shall be erected as shown on the Plans. The members shall be handled carefully, and members that are damaged shall be removed and new members substituted in their place without extra compensation.

635.4-FILLING CRIB:

The filling of the interior and backfilling of the crib shall progress simultaneously with the erection of the cribbing and shall be as specified in 634.

635.5-METHOD OF MEASUREMENT:

The quantity of work done will be measured in square feet (meters) of "Metal Cribbing", complete in place and accepted, determined by actual overall measurements of the outside face of the structure.

"Structure Excavation" will be limited to a plane 18 in.(450 mm) from and

parallel to the faces of the cribbing.

635.6-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item below, which price and payment will be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work, except that the necessary structure excavation, with limitations as specified above, will be paid for as Item 212001-*, "STRUCTURAL EXCAVATION". The cost of granular filling of the interior and backfilling behind the crib shall be included in the unit price bid for "Metal Cribbing".

635.7-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
635001-*	METAL CRIBBING	FOOT (METER)

* Sequence number

SECTION 636 MAINTAINING TRAFFIC

636.1-DESCRIPTION:

This work shall consist of all necessary measures to maintain and to protect traffic, to protect the work in process, to protect adjacent property from excess dust resulting from the construction area and to maintain traffic through, around or adjacent to the construction area, in accordance with these Specifications or as directed. The work shall include the furnishing and maintaining of all traffic control devices, flaggers and pilot truck; construction of temporary structures when required; labor, equipment and materials to keep the traveled road smooth; and the furnishing and application of dust palliatives.

636.2-MATERIALS:

Materials shall conform to the following requirements of Division 700, except as otherwise noted:

MATERIAL	SUBSECTION
Aggregate	704.6 Class 1 *
Asphalt Emulsion	705.4 SS-1, SS-1h, CBAEP, or AEM-1 **
Cationic Emulsified Asphalt	705.11 CSS-1 or CSS-1h **
Calcium Chloride	715.1
Traffic Control	715.9
Traffic Zone Paint	711.41 (Type II) or 711.40 (Temporary Paint).
Raised Pavement Markers and Other Pavement Marking Material	715.40
Pilot Truck	A Vehicle of the pick-up or jeep type, equipped with a prescribed sign mounted on the rear portion of the vehicle in such a manner as to be easily visible by following motorists.
Day	As used in this Specification, a day is considered to be a 24-hour period.

* When aggregate for maintaining traffic is not to be part of any succeeding base or pavement course, the appropriate aggregate size shall be determined by the Engineer and the requirements for gradation, Los Angeles abrasion and sodium sulphate soundness shall be waived.

** SS-1, SS-1h, CSS-1 and CSS-1h may be diluted with water.

CONSTRUCTION METHODS

636.3-CONTROL OF TRAFFIC THROUGH WORK AREAS:

Control and protection of traffic through work areas shall comply with these Specifications and the provisions of the Plans. Traffic shall be maintained over the project, over such other routes as shown on the Plans, or as directed by the Engineer. The traffic route shall be kept as smooth as possible, passable and safe for anticipated speeds.

All traffic control devices shall be fabricated and installed according to the

manual, "Traffic Control for Street and Highway Construction and Maintenance Operations", published by the Division. The type of construction operation being performed will dictate the traffic control case (scheme) to be used as outlined in this manual and as called for on the Plans.

All stockpiles of materials shall be located so that they will not interfere with traffic being routed through or adjacent to work areas. Stockpiles of materials shall be located a minimum of 30 ft. (10 m) from the edge of the traveled roadway unless traffic is protected by a positive barrier. Parking areas for the Contractor's employees, and all other vehicles shall be at locations which do not interfere with the safety of the traveling public, and on freeway type facilities shall be a minimum of 30 ft. (10 m) from the edge of the traveled roadway unless traffic is protected by a positive barrier. At the end of a day's operation the Contractor shall have no equipment or materials on the traveled roadway, median area or shoulders or in any areas which interfere with the safe movement of traffic.

The traffic control plan specified in the contract for each traffic control situation is considered the plan to be followed by the Contractor. However, should the Contractor desire to adopt another traffic control plan during construction, this alternate method shall be submitted to the Engineer for review and approval at least 14 days in advance of the commencement of work in the affected areas.

The traffic control devices shall be installed immediately before the beginning of construction and shall remain in place only as long as they are needed and shall be removed immediately. Any traffic control device that does not apply to the existing condition shall be removed, covered or turned so as not to be readable by oncoming traffic.

All traffic control devices erected by the Contractor shall be maintained as indicated by a weekly inspection, cleaned when directed by the Engineer and removed by the Contractor when the conditions no longer warrant the devices. Maintaining the control devices shall include keeping them in good condition, correct position, unobscured by weeds, brush, trees, work material or equipment. The Contractor shall designate a trained person with authority to take all actions necessary for the safe control of traffic through the work zones.

If the Total Contract Bid Amount is over \$500,000 or is otherwise noted on the plans this person shall be American Traffic Safety Service Association (ATSSA) certified or shall demonstrate equal qualifications, approved by the Division. The Contractor shall provide the Engineer with the telephone number of this person, along with the telephone number of any other personnel who is in charge of traffic control devices, in case of emergencies at night or on weekends.

All conflicting pavement markings, as determined by the Engineer, shall be eradicated by the Contractor as soon as practicable. The eradication shall be performed prior to shifting traffic.

Positive barriers shall be either temporary concrete barrier, or temporary guardrail barrier. Temporary guardrail barrier shall be installed with 6 ft. 3 in. (1.905 meter) post spacing with block outs, unless otherwise specified. The end

636.4

treatment for temporary guardrail barrier shall be FET or TET as specified on the Standard Details. Payment for the end treatment shall be made under the regular pay item. The ends of the temporary concrete barrier shall be either flared or protected, as indicated on Plans. Where temporary guardrail barrier is used, a minimum clearance behind the barrier of 4 feet (1.2 m) from the face of the guardrail shall be provided.

Barricades shall be used only as channelizing devices. When temporary guardrail barricades (mounted on barrels) are used, the ends of the guardrail shall be either flared or tapered as shown on the Plans.

636.4-AGGREGATES AND DUST PALLIATIVES:

Aggregates required for the maintenance of traffic, water, liquid asphalt, asphalt emulsion, cationic emulsified asphalt or calcium chloride for use as dust palliatives, shall be furnished and applied as directed by the Engineer. Water or other dust palliative shall be used on haul roads and any location on the project to minimize pollution from dust, when dust is creating a nuisance to the traveling public or adjacent property owners. No payment will be made for other dust control. Temporary roads shall be constructed when called for, and such roads, as well as the road under construction, shall be surfaced and maintained with aggregates, as shown on the Plans or as directed by the Engineer.

636.5-TEMPORARY STRUCTURES:

Temporary structures shall be constructed and maintained as shown on the Plans or as called for in the Proposal.

636.6-PILOT TRUCK AND DRIVER OR SHADOW VEHICLE:

636.6.1 - Pilot Truck & Driver: A vehicle and a qualified driver shall be furnished by the Contractor when shown on the Plans or directed by the Engineer.

636.6.2 - Shadow Vehicle: A shadow vehicle shall be furnished by the Contractor when called for on the Plans or directed by the Engineer. This vehicle shall be a standard truck weighing between 10,000 GVW (4 536 kg) and 24,000 GVW (10 880 kg) maximum, and shall be equipped with a flashing or rotary yellow beacon which can be seen in all directions and a truckmounted attenuator mounted on the rear.

The shadow vehicle shall be used at the locations shown on the Plans where a lane is closed and work is in progress. When work is completed for the day, the shadow vehicle shall be relocated behind a positive barrier or off the job site in a safe location.

636.7-ERADICATION OF PAVEMENT MARKINGS:

All markings which may conflict with desired traffic movement, as determined by the Engineer, shall be fully eradicated as soon as practicable.

Eradication shall be performed prior to shifting of traffic.

Eradication shall be performed by hydro-blasting, sand blasting, chemicals, burning with excess oxygen or other suitable method.

Full eradication shall be defined as the removal of at least 90 percent of the existing marking. A 90 percent removal will be determined by the Engineer by comparison with the Eradication Visual Standard. This Standard can be obtained from the Engineer. In addition to the visual comparison, the 90 percent removal level is defined such that there will not be any remaining surface of the original paint film in the eradicated area. The remaining 10 percent of the existing marking will appear to be as part of the texture of the pavement.

The method used shall not materially damage the surface or texture of the pavement. Any damage caused by the Contractor's operations shall be corrected at the Contractor's expense and in a manner approved by the Engineer.

The Contractor shall take precaution to protect the public from any damage due to their operations. Accumulation of sand, water, dust or other residue resulting from the eradication operation shall be removed as the work progresses.

636.8-TEMPORARY PAVEMENT MARKINGS AND RAISED PAVEMENT MARKERS:

Temporary pavement markings and raised pavement markers shall be in accordance with 663.

Temporary pavement markings, to be used in delineating pavement lane and edge lines, shall be either temporary reflectorized pavement marking tape or reflectorized paint as approved by the Engineer.

When placing temporary pavement lane markings to separate traffic traveling in the opposite directions, it should be noted that, if there is no passing in both directions, double-yellow solid lines shall be placed; i.e. single-yellow solid lines are prohibited for separating opposite flowing traffic. In addition to temporary marking tape or paint, temporary raised, reflectorized pavement markers shall be placed, when called for on the Plans, for added delineation, at approximately 40 ft. (12 meter) intervals along the lane lines that separate traffic traveling in the opposite directions, with the markers centered transversely between double-yellow lines, or at the spacing required on the Plans.

When temporary raised pavement markers are specified as an alternate to temporary paint or to temporary tape, the configurations shall be as follows
solid line - markers shall be placed on five foot (1.5 m) centers along the entire length of line; lane line - four markers shall be placed on three foot four inch (1 m) centers with 40-foot (12 m) spacing, first marker to first marker; double yellow - markers shall be placed on five foot (1.5 m) centers in pairs.

Temporary pavement markings and raised markers shall be placed as soon as practicable after construction of a detour or other roadway requiring this

636.9

type of delineation.

636.9-TRAFFIC CONTROL DEVICES:

Traffic control devices for work areas include, but may not be limited to, signs, barricades, drums, cones, delineators and flashers. They shall be installed in accordance with standards detailed in the manual, "Traffic Control for Street and Highway Construction and Maintenance Operations," published by the Division, or as shown on the Plans.

If the Total Contact Bid Amount is over \$500,000 or otherwise noted on the plans Traffic Control Devices also include work area signs indicating fines. These signs shall be installed 500' (150 m) after the first maintenance of traffic sign installed for each project. The signs shall be installed in both directions on the road under construction. The sizes, messages, and designs shall as shown in the Sign Frabrication Manual or as directed by the Engineer. with the larger size used for four lane expressway roadways with speeds of 55 MPH or greater and the smaller sign used for two lane roadways with speeds of 50 MPH or greater and with an ADT at 3,000 or greater. A 12' x 6' expressway sign (item 636011-* - 300 units) placed behind guardrail on 3 - 4 #BB U-Channel or on 3 - 4" x 4" wood post (breakaway) or 8' x 4'- two lane highway sign (item 636011-* - 180 units) placed behind guardrail on 2- 4 #BB U-Channel or on 2 - 4" x 4" wood post (breakaway).

636.10-CLEANING OF TRAFFIC CONTROL DEVICES:

Cleaning of all traffic control devices, when directed by the Engineer, shall consist of hand cleaning with a mild detergent followed by a thorough rinse with clear water. No harsh chemical, abrasive cleaner or tool shall be used that will damage the reflectorized surfaces or otherwise reduce the useful life of the device.

636.11-FLAGGER-TRAFFIC DIRECTOR:

The flagger-traffic director are separate functions and therefore, shall not be interchanged.

All flaggers shall be furnished by the Contractor, and it shall be the Contractor's responsibility to provide flaggers at any location necessary to assure the safety of the travelling public. When flaggers are required at locations as a result of operations considered reasonable and necessary by the Engineer to complete the project, payment will be made under this provision.

Hand signaling devices, orange headgear and vests shall be used by the Contractor's personnel assigned to traffic control responsibilities. Headgear and vests worn by the Contractor's flagger shall not bear the Division symbol.

Two-way radios shall be provided to the flaggers when they are out of sight of each other.

The traffic director shall be an off-duty police officer. The traffic director shall have all of the necessary equipment including uniform and properly identified police vehicle so that the public recognizes the law enforcement power of the individual. The Contractor shall provide the traffic director.

The traffic control plan (TCP) and any approved revisions will be strongly considered in determining the appropriateness of payment. Flagger-Traffic Director required for operations that are not necessary but are initiated by the Contractor for their benefit or ease of operations shall not receive payment under this provision. Flagger-Traffic Director required outside of the project limits as a result of any of the Contractor's operations shall not receive payment. Flagger-Traffic Director required within the project limits in regards to the Contractor's transportation to or from waste areas, borrow pits, concrete plants or other necessary sites shall receive payment if considered reasonable and necessary as previously discussed.

636.12 to 636.13-BLANK

636.14-TEMPORARY CONCRETE BARRIERS:

This barrier type shall conform to the details on the Plans, set as directed on the Plans, with the barrier sections securely connected together by satisfactory fastening devices to Provide a more stable structure against impact.

Where temporary concrete barrier adjoins guardrail barrier, regardless if one is temporary and the other is permanent (newly constructed or previously in existence) or if both are temporary, they must be connected with a Temporary Guardrail Connector conforming to 636.16.2.

Where temporary concrete barrier adjoins bridge parapet or other essentially non-yielding barrier or obstacle, they must be joined in a manner to maintain barrier continuity and prevent vehicle snagging during impact. If they cannot be joined in this manner, a connecting device must be used to assure barrier continuity and to prevent vehicle snagging during impact.

When the temporary concrete median barriers are no longer needed, they will become the property of the Contractor, unless otherwise noted on the Plans.

636.15-REMOVING AND RESETTING TEMPORARY CONCRETE BARRIERS:

Temporary concrete barriers that are to be relocated within a project shall be salvaged and reinstalled as specified in 636.14 and set as indicated on the Plans.

636.16-TEMPORARY GUARDRAIL:

636.16.1-Temporary Guardrail Barrier: Temporary guardrail barrier shall consist of guardrail (beam) mounted on 6 ft. 3 in. (1.905 m) post spacing with blockouts, conforming to the requirements of 607. Where temporary guardrail barrier adjoins concrete barrier, bridge parapet, or other essentially non-yielding obstacle, regardless if one is temporary and the other is permanent (newly constructed or previously in existence) or if both are temporary, they must be connected with a Temporary Guardrail Connector conforming to 636.16.2.

636.16.2

636.16.2-Temporary Guardrail Connector: This connector shall consist of the last 25 feet (7.62 m) of guardrail (beam) prior to the physical connection to a non-yielding barrier or obstacle, mounted on 3 ft. 1½ in. (0.9525) post spacing with blockouts, conforming to Standard Sheet G.R. 5 and an End Shoe conforming to Standard Sheet G.R. 2A. Four bolts shall be used in the End Shoe and standard posts may be substituted for the oversized wood posts.

636.17-REMOVING AND RESETTING TEMPORARY GUARDRAIL BARRIER:

Temporary guardrail barrier that is to be relocated within the project shall be salvaged and reinstalled as specified in 636.16.

636.18-ELECTRIC ARROW:

The electric arrow panel shall be located as shown in the manual, "Traffic Control for Street and Highway Construction and Maintenance Operations", published by the Division, or as shown on the Plans. For construction areas, the electric arrow shall be portable, trailer mounted on a nonreflective flat black panel 48 in. high by 96 in. (1.2 meters high by 2.4 meters) wide with a minimum legibility distance of one mile (1.6 km). Minimum mounting height, measured from the roadway to the bottom of the panel, shall be 7 feet (2.1 m) except on vehicle mounted panels which shall be as high as practicable. The electric arrow shall have the capability of the following mode selection Left Arrow, Right Arrow, Left and Right Arrow and Caution, with Caution mode consisting of four or more lamps arranged in a pattern which will not indicate a direction. Arrow panels shall automatically dim 50 percent from their rated lamp voltage during hours of darkness. The flashing rate of the lamps shall be between 25 and 40 flashes per minute. Minimum lamp "on time" shall be 50 percent.

636.19-CHANGEABLE MESSAGE SIGN:

Changeable message sign shall consist of the furnishing, installing and maintaining of a three-line variable message sign on a portable trailer. Each unit shall be self-contained and consist of a message board, controller, power supply, electrical cable and adjustable height structural support system. It shall be equipped to accept power supply from a completely self-contained diesel generator, existing commercial electrical service, or battery pack which is recharged automatically by solar panels. The trailer system assemblage shall conform to the laws of the State of West Virginia and all articles of the licensing regulations presently in effect. The sign shall only be attached to its tow vehicle when installation or removal is in progress. The trailer and its leveling jacks shall be designed to keep the unit from changing its deployed position once placed. Devices which lock the wheels and/or leveling jacks into place shall be employed. Sandbagging of the frame and/or leveling jacks is not an acceptable manner of lock down.

All parts of the system shall comply with codes annotated in the National Fire Protection Association and Underwriters Laboratory and all local electrical codes. Earth ground shall be tied to the sign's chassis. Lightning protection

shall be supplied for the load site.

The changeable message sign shall be the disc matrix or LED lamp matrix panel type capable of operating in temperatures from -30° to $+160^{\circ}$ F (-36° to 72° C) and capable of displaying alphanumeric characters and arrows. The sign panel assembly, including the mounting brackets, shall not exceed 128 inches (3.15 meters) in overall width. The bottom of the sign panel shall be a minimum of 7 feet (2.13 m) above the roadway. The display shall be yellow or amber character on black background, a 7 x 5 character font, minimum character height of 18 inches (450 mm), and character spacing at a minimum of two dots or one half the character width unless otherwise approved by Traffic Engineering Division. The unit shall have several preprogrammed messages and be capable of programming at least fifty new messages and storing such. The controller shall be housed in a weatherproof lockable cabinet that is accessible from a suitable mounting on the trailer. The controller shall be a microprocessor controller or lap-top computer with an incorporated keyboard and CRT which allows the users to access, generate, and store messages. The controller display shall be a miniaturized approximation of the actual display or a message being assembled.

The cycle time and duration of message for a changeable message sign is a function of the highway operating speeds and the size letters displayed. The entire message should be visible at least twice at the operating speed. When traveling at 65 MPH (105 km/h) (freeway speeds), a driver has approximately seven (7) seconds to read the message, resulting in that the message should not be longer than four (4) words or numbers and not longer than two (2) units of information. The message displayed from each unit shall be visible from one-half mile (805 meters).

The sign shall be capable of changing to and displaying a programmed default message or four corner dots flashing in the event of power failure. If battery backup (in event of power interruption) is called for on the plans, all functional operations to include sign lighting shall be operational up to two hours. Fluorescent lighting or LED lamp matrix shall be applied to provide nighttime visibility and the intensity of the sign shall be adjustable by automatically dimming or manual control.

Site selection and message displayed shall be approved by the Engineer. The changeable message sign shall always be located behind the channelizing devices or barriers away from moving traffic lanes. In work zones, it shall be located in clear buffer barricades without reducing the sign's visibility.

The unit shall be kept in good repair at all times. The Contractor shall maintain the device if failures occurs. Failure, malfunction or damage to the unit for any reason shall require the Contractor to expedite the repair and furnish adequate signing and flaggers as deemed necessary by the Engineer to safely control traffic through the work area. Maintenance shall include periodic cleaning of the unit.

When the changeable message sign is to become the property of the Division, each unit shall be delivered with the following items:

636.20

- i. Operator's manual for sign-raising mechanism and sign operations.
- ii. Schematic wiring diagram of the sign, remote control console and the control unit.
- iii. Service manual for the sign, sign-raising mechanism control unit and the remote control console.
- iv. Record of Serial Numbers, Model Numbers, and Model Types for the changeable message sign and any attendant diesel engine.
- v. Warranty on the sign-raising mechanism, sign remote control console and control unit.
- vi. Inspection and operational tests.

636.20-TEMPORARY TRAFFIC SIGNAL(S) OR TEMPORARY LIGHTING:

Temporary traffic signal(s) shall consist of furnishing, installing, maintaining and subsequent removal of various types of traffic signal systems as necessary due to the maintenance of traffic plan. It shall include, but not be limited to, traffic signals and traffic signal interconnections to be installed in accordance with Section 660 and Subsection 715.42 of the Specifications. As a minimum, the temporary traffic signal(s) shall be equipped with a three-dial fixed time controller. When the temporary traffic signal(s) are no longer needed, they will become the property of the Contractor.

Temporary lighting shall consist of furnishing, installing, maintaining, and subsequent removal of various types of lighting systems as necessary due to the maintenance of traffic plan. It shall include but not be limited to lighting to be installed in accordance with Section 662 of the Specifications. When the temporary lighting is no longer needed, it will become the property of the Contractor.

636.21-TEMPORARY PIPE FOR MAINTAINING TRAFFIC:

Temporary pipe for maintaining traffic shall conform to the requirements of 604.

636.22-WARNING LIGHTS:

Warning lights shall consist of the furnishing, installation and maintenance of a portable, lens directed, enclosed light. The warning lights shall be in accordance with the requirements of 715.9.5 of the Standard Specifications.

636.23-METHOD OF MEASUREMENT:

The quantities of work done will be measured as follows:

636.23.1-Aggregate: The quantity of "Aggregate for Maintaining Traffic" will be measured in tons (megagrams) of aggregate applied and accepted.

The number of tons (megagrams) shall be determined by the total of the weights shown on receipted railroad freight bills when materials are shipped by rail; by actual measured displacement of barges certified by the producer when

water shipments are made, providing materials delivered by the methods are not stockpiled or stored; or determined by the Contractor from the total of weigh slips for each vehicle load weighed on an approved standard scale or from digital printout slips from an automatic batching plant, and certified by the Contractor to be correct.

Truck scales shall be provided by the producer or Contractor, except that truck scales are not required where the material is weighed at properly calibrated automatic batching plant facilities which are equipped with digital print-out equipment. The scales shall be of sufficient size and capacity to weigh the heaviest loaded trucks that are used for delivery of the material.

All truck scales shall be mounted on solid foundations which will insure their remaining plumb and level. All truck scales shall be inspected and sealed by the West Virginia Division of Labor, Bureau of Weights and Measures, or other appropriate agencies of the State or its political subdivisions. The Division may, at its option, accept inspection and sealing by out of state agencies when the material is weighed outside West Virginia.

A weigh person shall be provided by the producer. The weigh person shall certify that the weight of the material, as determined either by the truck scales or from the digital print-out of the weights, is correct.

Each truck shall be weighed empty prior to each load, except at automatic batch plants approved to operate without truck scales. A digital recorder and print-out shall be required on all truck scales. The digital recorder shall produce a printed record of the gross, tare and net weights, and the time, date, truck identification and project number.

Provision shall be made for constant zero compensation and further provision shall be made so that scales may not be manually manipulated during the printing process. The system shall be interlocked so as to allow printing only when the scale has come to rest. In case of a breakdown of the automatic equipment, the Engineer may permit manual operation for a reasonable time, normally not to exceed 48 hours, while the equipment is being repaired.

636.23.2-Bituminous Material: The quantity of "Bituminous Material for Dust Palliative" shall be the number of gallons (liters), prior to dilution in the field, incorporated into the completed work and will be measured as prescribed in [109.1](#).

636.23.3-Calcium Chloride: The quantity of "Calcium Chloride for Dust Palliative" shall be the number of tons (megagrams) actually used for the work, determined by the total of the weights of the individual units when shipped in packages.

636.23.4-Temporary Structures: "Temporary Structures for Maintaining Traffic", as detailed on the Plans or called for by the Engineer, shall be on a lump sum basis for completing, maintaining and removal of the work.

636.23.5-Pilot Truck and Driver: "Pilot Truck and Driver" shall be on a

636.23.6

per day basis and shall include auxiliary barriers and warning signs of all necessary types used in conjunction with the pilot truck.

636.23.6-Traffic Control Devices: "Traffic Control Devices" will be measured by the number of units of traffic control devices used and accepted. The relative value of each traffic control device in units shall be as shown in the traffic control device rate schedule. The total units of traffic control devices shown in the Contract is an estimated amount only and may be adjusted up or down by the Engineer in accordance with the needs of the project. When more than one sign is attached to a post(s), mount(s) or barricade, the signs will be measured as a sign assembly and not as individual signs.

The price bid per unit of traffic control devices shall include furnishing, maintaining and removing, filling drums with sand as required, providing sand bags as ballast on barricades, replacement batteries for flashers, turning, covering or otherwise causing signs to be unreadable to traffic when the message does not pertain to the existing condition and all other miscellaneous items required for maintaining traffic.

Traffic control devices completely destroyed by traffic or any other means shall be replaced by the Contractor, with no additional payment to the Contractor.

A payment of $\frac{1}{4}$ the rate shown shall be made to the Contractor for any traffic control devices that the Contractor moves more than 500 ft. (150 m) when directed by the Engineer.

This rate shall not apply for continuous type operations such as resurfacing projects. Payment for continuous type operations shall be made for the initial placement only. No additional compensation will be made for the moving of traffic control devices made necessary due to the nature of continuous type work.

TRAFFIC CONTROL DEVICES RATE SCHEDULE		
Device #	Description	Value in Units Each Traffic Control Devices
1	Signs on portable mounts and barricades (Total sign area 16 sq. ft. (1.5 sq. meters) or greater)	170
2	Signs on portable mounts and barricades (Total sign area less than 16 sq. ft. (1.5 sq. meters))	80
3	Signs on permanent posts (Total sign area 16 ft. (1.5 sq. meters) or greater.)	180
4	Signs on permanent posts (Total sign area less than 16 sq. ft (1.5 sq. meters).)	90
5	Barricades-Type I	35
6	Barricades-Type II	60
7	Barricades-Type III	90
8	Drums	60
9	Cones	5
10	Vertical Panel or Ground Mounted Delineators	10
11	Barrier or Guardrail Mounted Delineators (Bid Incidental to Barrier or Guardrail)	0

Orange sign sheeting to be Reflective Fluorescent Orange, Type V. All other signs shall be High Intensity, Type II.

Drum sheeting to be 6" (150 mm) Flexible High Intensity, Type IV

Barricade sheeting shall be High Intensity, Type II or IV

Cone sheeting shall be Flexible High Intensity, Type IV

Only those drums which have been field tested and approved by the Division

636.23.7

will be permitted. A list of the approved suppliers and their code numbers may be obtained by contacting:

West Virginia Division of Highways
Contract Administration Division
312 Michigan Avenue
Charleston, West Virginia 25311

Payment for furnishing, installing, and maintaining the work area signs indicating fines shall be as part of Item 636011-*. "TRAFFIC CONTROL DEVICES." and all the previous provisions of this Article shall apply.

636.23.7-Water for Dust Palliative: Water for dust palliative will be measured and paid for under Item 637001-*.

636.23.8-Eradication of Pavement Marking: The quantity of "Eradication of Pavement Markings" shall be the equivalent linear feet (meters) of 4 in. (100 mm) solid line actually removed from the pavement. As an example, an 8 in. (200 mm) solid line would double the linear quantity.

636.23.9-Temporary Pavement Markings-Paint: The quantity of "Temporary Pavement Markings-Paint" shall be the equivalent linear feet (meters) of 4 in. (100 mm) solid line actually placed on the pavement. See example in 636.23.8.

636.23.10-Temporary Pavement Markings-Tape: The quantity of "Temporary Pavement Markings-Tape" shall be the equivalent linear feet (meters) of 4 in. (100 mm) solid line actually placed on the pavement. See example in 636.23.8. Payment for Temporary Pavement Markings includes the removal of the pavement marking tape.

636.23.11-Temporary Raised Pavement Markers: The quantity of "Temporary Raised Pavement Markers" shall be the actual number of markers placed on the pavement. Payment shall include the subsequent removal of the temporary pavement markers.

636.23.12-Cleaning of Project Traffic Control Devices: The quantity of "Cleaning of Project Traffic Control Devices" shall be the actual number of times that all of the traffic control devices, including all channelizing devices, are cleaned on the entire project. Payment will be made for each time all the devices on the whole project are cleaned.

636.23.13-Cleaning of Individual Traffic Control Devices: The quantity of "Cleaning of Individual Traffic Control Devices" shall be the actual number of individual traffic control devices cleaned. When temporary guardrail barricades are cleaned, each barrel will be considered an individual device

when payment is made under this item.

No additional payment shall be made for the cleaning of any delineator regardless of the type of material. Such costs shall be incidental to the cost of cleaning other traffic control devices. For cleaning purposes, any traffic control device attached to a barricade shall be considered part of the barricade. Similarly, any warning light attached to a sign shall be considered part of the sign.

636.23.14-Flagger-Traffic Director: Flagger shall include the cost of furnishing, installing, maintaining and moving of the "AdvanceFlagger" signs along with the actual flagging of traffic. The flaggers shall be paid for the actual authorized time controlling traffic and up to 30 minutes travel from a previous assignment.

The quantity "Traffic Director" shall be the actual number of hours worked in traffic control. The traffic director shall be paid for the actual authorized time controlling traffic which includes the cost for the police vehicle.

636.23.15 THROUGH 636.23.16 -BLANK

636.23.17-Temporary Concrete Barrier: The quantity of "Temporary Concrete Barrier" shall be the linear feet (meters) of barrier actually placed. Payment shall include terminal connecting devices, dismantling, removal and disposal of the barrier and devices when no further use is required.

636.23.18-Removing and Resetting Temporary Concrete Barrier: The quantity of "Removing and Resetting Temporary Concrete Barrier" shall be the linear feet (meters) of barrier reused in a different location. Payment shall include temporary storage if necessary, re-erecting, maintaining, dismantling, removal and disposal of the barrier.

636.23.19-Temporary Guardrail Barrier: The quantity of "Temporary Guardrail Barrier" shall be the linear feet (meters) of barrier actually placed, including the last twenty five foot (7.62 M) connector section. Payment shall include the dismantling, removal and disposal of the barrier and temporary connectors when no further use is required.

636.23.20-Removing and Resetting Temporary Guardrail Barrier: The quantity of "Removing and Resetting Temporary Guardrail Barrier" shall be the linear feet (meters) of barrier reused in a different location. Payment shall include temporary storage, if necessary, re-erecting, maintaining, dismantling, removal and disposal of the barrier.

636.23.21-Electric Arrow: The quantity of "Electric Arrow" shall be the actual number of days that the arrow is used on the project.

636.23.22-Changeable Message Sign: The quantity of "Changeable

636.23.23

Message Sign" shall be the actual number of days that the sign is used on the project.

636.23.23-Temporary Traffic Signal(s) or Temporary Lighting:

"Temporary Traffic Signal(s)" or "Temporary Lighting" shall be on a lump sum basis and shall include the furnishing, installation, maintaining and subsequent removal of all equipment and material necessary to adequately meet the requirements of the Traffic Control Plan.

636.23.24-Temporary Pipe for Maintaining Traffic: The quantity of "Temporary Pipe for Maintaining Traffic" shall be the linear feet (meters) of pipe actually placed, as detailed on the Plans. Payment shall include the removal and disposal of the pipe when no longer needed.

636.23.25-Warning Lights: The quantity of "Warning Lights" shall be the actual number of days that a light is used on the project.

636.23.26 - Shadow Vehicle: A shadow vehicle shall be on a per-day basis and shall include the flashing beacon, fuel, crew and truck-mounted attenuator used in conjunction with the vehicle.

636.24-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which prices and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies and incidentals necessary to complete the work. When aggregate for maintaining traffic, dust palliatives, flagger, traffic director, cleaning of traffic control devices or the electric arrow are contained in the contract as pay items, payment for such pay items will not be made subsequent to the date of required completion of the project.

If during the prosecution of the work, additional items under this Section, not included in the contract, are found to be necessary as determined by the Engineer, payment for such additional items will be made under the provisions of 104.3.

SECTION 637

WATER

637.1-DESCRIPTION:

This work shall consist of furnishing, and applying or incorporating, as the case may be, water required for compacting embankments, for stabilizing soils or other materials, as a dust palliative, or for any other specially designated purpose, in accordance with these Specifications and in accordance with the requirements of the Plans or as directed by the Engineer.

637.2-MATERIALS:

Water shall conform to the pertinent requirements set forth in these Specifications for its specific uses or, in the absence of such specific requirements for the designated use, the water shall be suitable for the purpose intended and shall be free of substances which would be deleterious to the work involved.

637.3-CONSTRUCTION METHODS:

The equipment to be used with the water operation involved will be approved by the Engineer as adequate and suitable for the purpose intended.

Water shall be incorporated in the manner, in the amounts, at the times, and for the purposes prescribed in these Specifications or as directed by the Engineer.

637.4-METHOD OF MEASUREMENT:

When the Contract includes a separate item for "Water", it will be measured by the gallon (liter), expressed in thousand-gallon (liter) units, and the quantity to be measured for payment will be the amount of water furnished and used for the purposes specifically designated as being included under the pay item. Measurements will be by means of tanks or tank trucks of predetermined capacity or by means of satisfactory and approved meters furnished by the Contractor.

When the Contract does not include a separate item for "Water", or when the Contract does include such an item and water is also furnished and used by the Contractor for purposes other than those specifically included in the item, such water not covered by a specific item will not be paid for directly but will be construed to be subsidiary work included under other Contract items.

637.5-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item below which price and payment will be full compensation for furnishing all the material and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

SECTION 638

PROJECT MARKERS, RIGHT-OF-WAY MARKERS, AND SURVEY MARKERS

638.1-DESCRIPTION:

This work shall consist of furnishing, and placing or installing at the points designated on the Plans or by the Engineer, metal (signpost) project markers, right-of-way markers, and concrete survey markers, in accordance with these Specifications and in reasonably close conformity to the lines, grades, dimensions, locations, and sections shown on the Plans or established by the Engineer.

638.2-MATERIALS:

Right-of-way Markers shall consist of # 6 (# 20) deformed reinforcing steel bars meeting the requirements of AASHTO M 31 and caps provided by the Division. Materials for project markers shall conform to the requirements specified on the Plans. Survey markers shall be constructed of concrete conforming to 715.12 or 715.19.

Survey Markers constructed without reinforcement shall contain sufficient steel near the top to provide magnetic detection.

CONSTRUCTION METHODS

638.3-RIGHT-OF-WAY MARKERS:

638.3.1-Right-Of-Way Marker Installation: Markers shall be set plumb and to a minimum depth of 36 inches (1 meter) and shall be flush to the ground. When rock is encountered in areas of proposed markers, they shall be grouted to a depth of 18 inches (0.5 meters) into the rock. Right-of-way markers shall be installed at points designating the right-of-way boundaries and at each break in the right-of-way line as shown on the Plans or as directed by the Engineer.

638.3.2-Installation: Markers shall be set plumb and to the depth shown on the Plans. The holes shall be backfilled with suitable material and thoroughly tamped.

Right-of-way markers shall be set at points designating the right-of-way boundaries and at each break in the right-of-way line as shown on the Plans or as directed by the Engineer. Right-of-way markers shall be accurately set to the mark given by means of intersecting strings. If approved by the Engineer, other

638.4

equally accurate methods may be substituted.

638.4-CONCRETE SURVEY MARKERS:

Survey markers shall be installed where indicated on the Plans or as designated by the Engineer. When locations for survey markers conflict with other construction, the survey markers shall be offset as directed by the Engineer.

Precast concrete markers shall be set plumb and to the depth shown on Plans. Installation shall be backfilled with suitable material and thoroughly tamped to obtain a very rigid installation. If a manufactured point on the bronze casting does not coincide with the survey point after installation, it shall be filed and the actual survey point shall be center punched and outlined by a cross.

638.5-METAL (SIGN-POST) PROJECT MARKERS:

Project markers shall be constructed in accordance with details and requirements on the Plans.

Project markers shall be placed at the beginning and end of projects, on the right side of the road or highway at the points designated by the Engineer. Project markers shall be located at the maximum practical distance not to exceed 30 feet (10 meters) from the edge of the pavement without obscuring or detracting from the effectiveness of other official signs. Project markers shall be driven in place, plumb and to the depth shown on the Plans. Defective or damaged markers will be rejected.

638.6-METHOD OF MEASUREMENT:

The quantity of work done will be the actual number of "Project Markers", "Right-of-Way Markers", or "Survey Markers", complete in place and accepted.

638.7-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for excavating, backfilling, disposing of surplus material, furnishing all the material and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

SECTION 639

CONSTRUCTION LAYOUT STAKES

639.1-DESCRIPTION:

When this item is included in the Proposal, it shall consist of furnishing, placing, and maintaining construction layout stakes necessary for the proper prosecution of the work under the Contract, all in accordance with these Specifications.

639.2-MATERIALS:

Wood stakes as specified.

639.3-CONSTRUCTION METHODS:

The Division will locate and reference the centerline and will establish bench marks along the line of the improvement for the proper layout of the work. The Contractor shall make all calculations involved and shall furnish and place all layout stakes.

The Contractor shall provide field forces and shall set all additional stakes needed, such as offset stakes, reference point stakes, slope stakes, pavement and curb line and grade stakes, stakes for bridges, sewers, roadway drainage, pipe underdrains, paved gutter, fence, culverts or other structures, supplementary bench marks, and any other horizontal or vertical controls necessary to secure a correct layout of the work. The Contractor shall also do all layout work and shall set stakes necessary for carrying out utility changes when such utility changes are an obligation of the Contractor under the Contract. The location of the slope stakes for grading work shall be determined by a calculation method. Stakes for line and grade of pavement and curb shall be set at station intervals of 25 ft. (10 meters) maximum distance on curves and at 50 ft. (20 meters) maximum distance on tangents. Elevation control hubs with guard stakes shall be set, at a convenient distance outside the construction limits, opposite every 50-ft (20 meters) station and all stations where original cross-sections have been taken. The centerline station, the distance from centerline, and the elevation of the hub shall be recorded on each guard stake.

For right-of-way staking, hubs with guard stakes shall be set on both sides of roadway at all locations where right-of-way changes width; the station number and the distance from the centerline shall be marked on each guard stake.

The Contractor shall be responsible for having the layout staking work conform to the lines, grades, elevations, and dimensions called for on the Plans.

The Contractor shall furnish a copy of their survey records for checking by the Engineer and for the Division's permanent file. These records shall be furnished as they are completed during the progress of the work. Any inspection or checking of the Contractor's layout by the Engineer and the acceptance of all or any part of it shall not relieve the Contractor of their responsibility to secure the proper dimensions, grades, and elevations of the several parts of the work.

639.4

The Contractor shall exercise care in the preservation of stakes and bench marks and shall have then reset at their expense when any are damaged, lost, displaced or removed. The Contractor shall use competent personnel and suitable equipment for the layout work required and shall provide that it be done under the supervision of, or directed by, a Registered Professional Engineer or Registered Land Surveyor. The Contractor shall not engage the services of any person or persons in the employ of the Division for the performance of any of the work covered by this item.

639.4-METHOD OF MEASUREMENT:

"Construction Layout Stakes" will be measured as a complete unit.

639.5-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for at the contract unit price bid for the item below, which price and payment shall be full compensation for furnishing, setting, maintaining, and resetting, when necessary, the stakes, and for furnishing all engineering personnel, equipment, materials, and all incidentals.

639.6-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
639001-*	CONSTRUCTION LAYOUT STAKE	LUMP SUM

* Sequence number

SECTION 640
FIELD OFFICE AND STORAGE BUILDING

640.1-DESCRIPTION:

This work shall consist of furnishing and maintaining in good condition suitable offices for the exclusive use of the Engineer as a field office or for making field tests, a storage building for concrete cylinder curing tanks, and equipment for the field office, all in accordance with these Specifications.

640.2-MATERIALS:

Not specified.

640.3-LOCATION AND TIME OF ERECTION:

The field office and storage building shall be set up at approved locations on or in the immediate vicinity of the Project. They shall be separated from any building used by the Contractor.

The field office and storage building shall be set up, equipped, and made ready for use at least three days prior to the beginning of the work on the project.

640.4-STANDARD FIELD OFFICE AND STORAGE BUILDING:

640.4.1-Office Building: The standard field office shall have a minimum floor space of 400 sq. ft. (40 square meters) and shall contain two rooms, each with a minimum plan dimension of 20 ft. by 10 ft. (4 by 5 meters). One room shall contain sufficient floor area to include such soil equipment necessary to perform the various compaction control tests as may be required as the work progresses.

The office shall be entirely enclosed, waterproofed, and sealed inside with wall board which will provide efficient insulation against heat and cold. The building shall have a pitched roof and two ventilating louvers, one in each gable, in order to provide for circulation of air between roof and ceiling. The floors shall be double thickness, with building paper between layers, and the ceiling height shall be not less than 7 feet (2.1 m). All doors, both interior and exterior, shall be equipped with locks. Windows, to furnish natural light, shall be constructed to open and close and shall be provided with latches. Screens shall be provided for all windows and exterior doors, and the building shall be generally flytight. The screen doors shall be equipped with springs and latches.

The office shall be provided with an approved type of heating and cooling equipment which will maintain a comfortable seasonable temperature throughout the project life. It shall be furnished with satisfactory electric lighting and lighting service. A minimum of two duplex convenience outlets shall be provided in each room. The building shall be provided with neat, sanitary, enclosed toilet accommodations for the exclusive use of the Engineer, and such facilities shall meet the requirements of the State Department of Health or other authorities having jurisdiction. It shall be stocked with lavatory and sanitary supplies at all times during the period of the Contract.

The office shall be attractively painted on the outside and shall be provided with a sign at least 4 feet (1.2 m) by 1 ft. (300 mm), with the sign content as follows:

FIELD OFFICE--THE WEST VIRGINIA DIVISION OF HIGHWAYS

The letters shall not be less than 3 inches (75 mm) high and shall be white on a black background. The sign shall have a white border at least 1½ in. (38 mm) wide.

640.4.2-Storage Building: The storage building for concrete cylinder tanks shall have a minimum floor space of 80 sq. ft. (7.4 m) preferably 8 feet by 10 feet (2.4 by 3.1 m). The ceiling height shall not be less than 7 feet (2.1 m).

The storage building shall be well insulated and capable of maintaining a reasonably constant temperature. It shall be provided with water, as required, and satisfactory electric lighting. Chairs, tables, and stools, as required, shall be furnished.

The Contractor shall furnish curing tanks with sufficient capacity to handle peak cylinder curing requirements. The tanks shall be equipped with thermostatically controlled units which are capable of maintaining specification water temperature in the tanks, and power shall be furnished.

640.4.3

640.4.3-Insurance: By the time the field office is made available to the Engineer, the Contractor shall have furnished the Engineer with evidence that insurance has been obtained and is in effect which will protect the Division to the extent of \$20,000.00 (non-deductible) against any loss of its property in the field office and storage building as a result of fire or theft.

This insurance must be kept in effect until the project is completed, and the evidence of renewal of the policy as necessary must be forwarded to the Engineer.

640.4.4-Maintenance: The field office and storage building shall be maintained in good condition and appearance by the Contractor for the duration of the project. No compensation will be allowed for loss by fire or by vandalism caused by non-Division personnel or for loss due to normal wear and tear.

640.4.5-Removal: After all field records pertinent to the project have been completed, the office and storage building shall be removed and disposed of by the Contractor and the site cleaned up and left in a neat and acceptable condition. The field office and storage building shall be allowed to remain for 45 days after final acceptance of the project, and shall be completely removed prior to 60 days after final acceptance of the project.

640.4.6-Alternate for Office Building: Adequate trailer space equivalent to the minimum floor space requirements may be furnished by the Contractor in lieu of the field office building. Minimum requirements for heat, lights, toilet facilities, insurance, maintenance, etc., shall be furnished for the trailer as for the office building.

640.5-SMALL FIELD OFFICE AND STORAGE BUILDING:

The small field office shall have a minimum floor space of 250 sq. ft. (23.2 sq. m) and shall contain two rooms, each with a floor space of approximately 10 ft. by 12 ½ ft. (3.1 by 3.75 m) The remainder of the requirements for the office building, the storage building, insurance, maintenance, and alternate for office building shall be as previously specified for the standard field office and storage building.

640.6-EQUIPMENT:

The following equipment shall be furnished for either size of field office building or alternate trailer facility:

- i. One office-type desk having at least two drawers on each side and one secretarial-type desk each having minimum top dimension of 30 in. by 60 in. (750 by 1 500 mm).
- ii. One filing cabinet when the total project bid is less than \$1,000,000; two filing cabinets when the total project bid is \$1,000,000 and less

than \$3,000,000; and three filing cabinets when the total project bid is \$3,000,000 or more. Cabinets shall be fireproof, four-drawer, legal size, and equipped with locks.

- iii. One plan rack.
- iv. One utility table 30 in. (750 mm) high and having top dimensions not less than 30 in. (750 mm) by 72 in. (1 800 mm)
- v. One sanitary-type water cooler supplied with water which shall be kept cooled electrically or with gas.
- vi. One closet extending the full height from floor to ceiling measuring not less 24 by 30 in. (600 by 750 mm) in plan, having at least two shelves, and equipped with a lock.
- vii. One electric typewriter with elite type and a 13- inch (325 mm) minimum carriage.
- viii. One desk model electronic adding machine with tape totalling a minimum of 10 digits.
- ix. One desk model, and two hand held model electronic calculators (all equipped with scientific functions), with a minimum entry of 10 digits and a minimum readout of 10 digits.
- x. Comfortable chairs and stools as required.
- xi. The Contractor shall provide at their own expense all utilities and janitor service. Telephone service, limited to the best available local facilities, shall be furnished unless alternate communication facilities are required by Plan notes.
- xii. Provide two telephones for a standard office and one telephone for a small office. One answering (message) machine shall be provided.
- xiii. One table top copier meeting the following minimum requirements:
 - 1. Produce 8½ in. by 11 in. (A4 and A3), 8½ in. x 14 in. and 11 in. x 17 in. copies.
 - 2. Reduction and enlargement features.
 - 3. Produce a minimum of 10,000 copies per month.
 - 4. The Contractor shall provide all service and maintenance of the copier.
- xiv. Provide one facsimile data processing unit that is compatible with Division's facsimile equipment.

If any of the equipment items are included as "in-built" in the field office or trailer, they may be omitted from the list.

640.7 COMPUTER SYSTEM FOR FIELD OFFICE:

Provide one (1) desktop computer system composed of the following minimum components.

- 1. The Contractor shall supply one (1) desktop computer with the following minimum components:

- Pentium II (Tower or Desktop) or greater
- 32 MB RAM upgradeable to 64 using onboard memory
- 512 K L2 Cache
- 4.0 GB Hard Drive
- 24 x CD ROM
- 3.5" diskette
- 4 MB AGP video
- 101 enhanced keyboard and Mouse
- 17" non-Interlaced color monitor
with .28 mm or less dot pitch
with 1024x768 resolution
- 1 - 56K V.90 Internal Fax/Modem
- Internal tape backup (minimum 250 MC-1/4" removable data cartridge media)

2. The Contractor shall supply one (1) laser printer with the following minimum components:

- 10 pages per minute
- 2 MB memory
- Parallel interface
- Post Script emulation (Level 2)
- Standard tray with minimum capacity of 200 sheets

3. The following accessories shall be supplied:

- a. Dust cover for all equipment
- b. Surge protector
- c. One (1) box (10 disks) Floppy diskettes
- d. One (1) box (5 cartridges) 1/4" removable data cartridges
- e. Mouse and mouse pad

4. The following software shall be supplied:

- a. One (1) Windows 95 or NT 4.0 package
- b. One (1) Tape backup package for Windows (latest version)
- c. One (1) Procomm, Plus communication package for Windows (latest version)
- d. One (1) Microsoft Office package '97

e. If the Contract documents specify the use of a CPM Schedule, the Contractor shall furnish one (1) CPM software package, SureTrak Project Manager for Windows by Primavera Systems, Inc. (latest version)

This desktop computer system, including hardware, software and manuals, will be furnished and maintained throughout the life of the project and shall be removed when the field office has been vacated by the Division of Highways project staff in accordance with 640.4.5.

The Contractor shall be responsible for all service and maintenance of the entire desktop computer system, including hardware and software. Replacement equipment shall be provided within five (5) working days of breakdown, theft or damage at no additional cost to the Division.

640.8-METHOD OF MEASUREMENT:

'Standard Field Office and Storage Building' "Small Field Office and Storage Building", "Building Equipment", "Computer System for Field Office", will be measured as complete units and shall include the complete execution of work described.

640.9-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing, erecting, insuring, maintaining and removing the field office and storage building computer system, and sanitary conveniences for the Engineer; all labor and materials, and all other work necessary and incidental thereto.

Monthly telephone invoice will be paid by the Engineer.

The field office, storage building equipment, computer system, furniture, fixtures, and facilities shall remain the property of the Contractor and shall be removed in accordance with 640-4.5 and the area dressed and restored.

640-10-PAY ITEMS:

SECTION 641

MITIGATION DEVICES

641.1 - GENERAL:

These devices include deflectors, weirs, random bolder placements, and rootball placements. These deflectors are to be built in accordance with the details contained in the plans and at the location as noted on the plans.

641.2 – PLACEMENT:

Log deflectors and weirs are to be tied together as shown on the details or by a means approved by the Engineer. Double deflectors may be either log or rock and are indicated in the plans. The random boulder placements are to be sized in accordance with the data on the detail sheet. Placement of these boulders is to be such as to allow free movement of water through and around them.

Rootball placements are to be as shown on the details contained within the plans.

All the devices with the exception of the rootballs all other devices are to be placed in a manner that they raise above normal flow approximately 1' - 2' (300 mm-600 mm), unless otherwise noted on the plans.

641.3 – BASIS OF PAYMENT:

The payment for this work shall include all the materials, doing the work in a workmanlike and acceptable manner, labor, tools, equipment, supplies and incidentals necessary to complete the work and will be paid for at the Contract Unit Price Bid for the items below.

641.4 – PAY ITEMS:

ITEM	DESCRIPTION	UNIT
641001-*	DEFLECTOR "type"	EACH
641002-*	WEIR	EACH
641003-*	RANDOM BOULDER PLACEMENT	EACH
641004-*	ROOTBALL PLACEMENT	EACH

SECTION 642

TEMPORARY POLLUTION CONTROL

Purpose-The Contractor shall exercise every reasonable precaution throughout the life of the project to control water pollution. Construction of permanent drainage facilities as well as performance of other contract work which will contribute to the control of siltation shall be accomplished at the earliest practicable time during the life of the Contract. Pollutants such as chemicals, fuels, lubricants, bitumens, raw sewage, and other harmful waste shall not be discharged into or alongside of rivers, streams, impoundments (lakes, reservoirs, etc.) or into natural or manmade water courses leading thereto. The Contractor shall also comply with the applicable regulations of the Department of Natural Resources and other statutes relating to the prevention and abatement of pollution. The purpose of these Specifications is to set forth certain temporary water pollution control measures which shall be required by the Contract in addition to the above.

642.1-DESCRIPTION:

This work shall consist of temporary control measures performed during the life of the Contract to control water pollution through use of berms, ditch checks, check dams, sediment structures (traps, ponds, or dams), mulches, fiber mats, seeding slope drains, and other erosion control devices or construction methods, in accordance with these Specifications and in reasonably close conformity with the lines, grades, thickness and typical cross sections shown on the Plans or established by the Engineer

The temporary pollution control provisions contained shall be coordinated with the permanent erosion control features specified elsewhere in the Contract to the extent practical to keep total erosion control costs to a minimum. These provisions shall also apply to work conducted outside the project right-of-way, such as operations in a borrow pit or waste site, where such work occurs as a result of the construction of the project.

These temporary water pollution control measures shall be continued until; permanent controls have been established; the need has been eliminated as determined by the Engineer; or the project has been accepted.

642.2-MATERIALS:

Materials will be considered acceptable when they are capable of accomplishing the intended purpose, do not in themselves contribute to pollution and comply with the following:

- i. Mulches may be hay, straw, wood cellulose fiber, wood chips, bark, matting or other material acceptable to the Engineer. Mulch materials shall be reasonably free of noxious weeds. Asphalt for anchoring hay or straw mulch shall be of a commercial grade. Chemical mulch binders shall conform to the requirements in [715.27.1](#).

642.3

- ii. Slope drains may be constructed of pipe, fiber mats, rubble, portland cement concrete, bituminous concrete, or other material that will adequately control erosion and is acceptable to the Engineer.
- iii. Temporary seed, such as annual ryegrass (Italian ryegrass), weeping lovegrass, cereal rye or wheat, barley or oats, and millet, used in temporary seed mixture or seed mixtures B or D, shall be of a commercial grade meeting requirements of the State Seed Law, Temporary seed labeled with the notation "germination below standard" will not be acceptable for use on projects. Temporary seed shall not be used on the project after one year from the date of germination test shown on the label. Seed other than that specified above shall meet the requirements of 715.28.
- iv. Fertilizer shall be a commercial grade of 1-2-1 ratio, meeting requirements of the governing state and federal laws.
- v. Others as shown on the Plans or specified by the Engineer (i.e. Temporary Pipe, Temporary Structures, etc.).
- vi. Ground agricultural limestone shall be of a commercial grade.
- vii. Engineering Fabric for Silt Fence shall meet the requirements of 715.11.

CONSTRUCTION METHODS

642.3-PRECONSTRUCTION CONFERENCE:

At the pre-construction conference, the Contractor shall submit for approval their schedules and methods for accomplishing the required temporary and permanent pollution control work during the construction stages involving clearing and grubbing; grading and drainage; structures; bases and pavement; and others as applicable. The Contractor shall also submit for approval proposed schedules and method for pollution control on haul roads, borrow pits, waste sites, and other project related operations, as applicable, conducted outside the right-of-way.

No work shall be started until the above pollution control schedules and methods have been approved by the Engineer.

642.4-GENERAL REQUIREMENTS:

The Engineer has the authority to limit the surface area of erodible earth material exposed by clearing and grubbing, to limit the surface area of erodible earth material exposed by excavation, borrow and fill operations and to direct the Contractor to provide immediate permanent or temporary pollution control measures as necessary to prevent contamination of adjacent streams or other watercourses, lakes, ponds, or other areas of water impoundment. Such work may involve the construction of temporary berms, ditch checks, check dams, sediment structures (traps, ponds or dams), slope drains, and use of temporary mulches, mats, seeding or other control devices or methods as necessary to control erosion.

The Contractor shall incorporate all permanent erosion control features into

the project at the earliest practicable time as outlined in their acceptable schedule. Temporary pollution control measures shall be used to correct conditions that develop during construction that were not foreseen during the design stage; that are needed prior to installation of permanent pollution control features, or that are needed temporarily to control erosion that develops during normal construction practices, but are not associated with permanent control features on the project.

Where erosion is likely to be a problem, clearing and grubbing operations shall be so scheduled and performed that grading operations and permanent erosion control features can follow immediately if the project conditions permit; otherwise temporary erosion control measures may be required between successive construction stages.

The Engineer will limit the area of excavation, borrow and embankment operations in progress commensurate with the Contractor's capability and progress in keeping the finish grading, mulching, seeding, and other such permanent pollution control measures current in accordance with the accepted schedule. Should seasonal limitations make such coordination unrealistic, temporary erosion control measures shall be taken immediately to the extent feasible and justified.

Unless otherwise approved in writing by the Engineer, construction operations in rivers, streams, and impoundments shall be restricted to those areas where channel changes are shown on the Plans and to those areas which must be entered for the construction of temporary or permanent structures. Rivers, streams, and impoundments shall be promptly cleared of all falsework, piling, debris or other obstructions placed or caused by the construction operations.

Excavation from any source shall not be deposited in or near rivers, streams, or impoundments or other wise located in such a manner which might be susceptible to erosion due to high water, flooding, or runoff.

Frequent fording of live streams with construction equipment will not be permitted; therefore, temporary bridges or other structures shall be used wherever an appreciable number of stream crossings are necessary. Unless otherwise approved in writing by the Engineer, mechanized equipment shall not be operated in live streams except as may be required to construct channel changes and temporary or permanent structures.

The location of all local material pits other than commercially operated sources, and all waste areas will be subject to the approval of the Engineer, and construction operations shall be conducted and pollution control measures implemented so that, both during and after completion of the work, erosion will not result in water pollution.

The Contractor shall, in accordance with the guidance contained in 642.3, submit schedules and methods in complete consonance with the intent of this Specification to prevent water pollution to the maximum extent possible. To provide a positive guide in this area, no more than 750,000 sq. ft. (7 hectares) each of erodible soil shall be exposed as a result of (1) clearing and grubbing and (2) excavation, embankment, borrow or waste for a maximum cumulative

642.5

total of 1,500,000 sq. ft. (14 hectares) without the approval of the Engineer. Approval to proceed beyond this point will be contingent upon (1) the Engineer's satisfaction, based on performance, as to the Contractor's ability to proceed with their operation and still maintain pollution control at the level contemplated by this Specification, and (2) seeding and mulching of disturbed areas at the Contractor's expense.

It is further understood that regardless of an approval such as the above or compliance with an approved schedule as set forth in 642.3, the Engineer may impose whatever limitations deemed necessary to assure an operation providing for pollution control consistent with the intent of this Specification. Reimbursement for such necessary temporary control measures required to eliminate the need for such limitation will be in accordance with the pertinent sections of this Specification. There will be no additional reimbursement to the Contractor due to losses from delays, production decreases or other causes resulting from the imposition of such a limitation.

In the event of conflict between these requirements and pollution control laws, rules, or regulations of other Federal, State, or local agencies, the more restrictive shall apply.

642.5-SEEDING AND MULCHING:

642.5.1-General: Seeding paid for under this section will include seed mixtures as defined in 642.5.3. The mixtures to be used will be determined by the Engineer. Seeding and mulching shall be performed on a continual basis starting when earth moving begins in the spring and stopping when the work stops in the winter or weather becomes too cold to operate seeding or mulching equipment. Embankments and cuts constructed during the winter season shall be treated as specified under 642.5.4,iii.

Seeding or mulching, or both, shall be performed on all cut and fill slopes, including waste sites and borrow pits, during the construction process. All disturbed areas such as diversion ditches, sediment dams, areas around sediment structures, haul road slopes, cleared and grubbed areas to remain exposed during a period of critical erosion, storage areas, location of batch plants, etc. shall be seeded when and where necessary to eliminate erosion.

Any areas failing to establish a satisfactory stand of grass due to weather conditions, adverse soil conditions, or due to erosion, shall be reseeded, refertilized and remulched as directed by the Engineer.

Final seeding, or second and third step seeding following the original seeding shall be performed in accordance with 652.

642.5.2-Schedule of Seeding Operations: Fill slopes, embankments, and waste sites shall be seeded and mulched in 10-ft lifts or once every two weeks, whichever occurs first.

Cut slopes and borrow pits shall be seeded and mulched each 15-ft depth of excavation or once every two weeks, whichever occurs first. However,

benched areas shall be seeded after completion of each bench, regardless of height.

642.5.3-Seed Mixtures and Planting Seasons: Temporary seed mixtures shall be used on any embankment or area which will be subject to further construction work before the project is completed. Seed mixtures B or D shall be used on cut slopes and fill or other areas not likely to be destroyed by further construction activities. It is the intent of the specifications that fill slopes be constructed to template and seeded with Type B or D mixtures, in successive stages, without fill slopes being fine graded or dressed. The type of seed mixture to be used on any area will be determined by the Engineer in accordance with Tables 642.5.3.1 and 642.5.3.2.

TABLE 642.5.3.1-TEMPORARY SEEDING MIXTURES			
Variety of Seed	Spring Mar. 1-May 15	Summer May 15-Aug. 15	* Fall & Winter Aug. 15-Mar. 1
	lb per acre (kg per ha)	lb per acre (kg per ha)	lb per acre (kg per ha)
Annual ryegrass	10 (11.25)		10 (11.25)
Barley or Oats (local seeds)	50 (56)		
Millet (Hungarian, Ger- man or Japanese)		50 (56)	
Cereal rye or Ceral wheat			50 (56)
TOTAL	60 (67.25)	50 (56)	60 (67.25)

* See Paragraph 642.5.4. iii.

642.5.3.2

TABLE 642.5.3.2-SEED MIXTURES B, D, & L

Variety of Seed	Seed Mixtures		
	*Type B	**Type D	Type L
	Median, Shoulders (Ditch Slope), Waterways, and Movable Areas of Interchanges	Cut and Fill Slopes (Including Benches)	All Areas
	lb per acre (kg per ha)	lb per acre (kg per ha)	lb per acre (kg per ha)
Kentucky 31 fescue	65 (72.9)	20 (22.4)	
Red Fescue (Pennlawn)	20 (22.4)	20 (22.4)	41 (46.0)
Crownvetch		20 (22.4)	
White dutch clover	3 (3.4)		
Annual ryegrass Aug. 1 to May 15 or	7 (7.8)	7 (7.8)	
Hard Fescue Mixture***			63 (70.6)
Annual Ryegrass August 1 to May 15 Or Weeping Lovegrass May 15 to August 1Aug. 1	3 (3.4)	3 (3.4)	12 (13.5) 5 (5.6)

* Areas shall be considered mowable when slopes are 3 to 1 or flatter.

** 30 lb. (13.6 kg) of cereal rye or cereal wheat shall be added to Type D mixture when wood cellulose fiber is used as a mulch for fall seeding, after October 1, at no additional cost to the Division.

*** A combination of approved certified varieties with no one variety exceeding 50% of the total hard fescue component.

642.5.4-Mulch, Fertilizer and Lime: Mulching, fertilizing and liming shall be in accordance with the following requirements:

- i. Two tons per acre (4.5 Mg per ha) of straw or hay mulch shall be applied on slopes of 1½ to 1 or flatter. Asphalt material to anchor the mulch shall be used at the rate of 50 gal. per ton (210 L per Mg) of straw or hay mulch. Other types of chemical mulch binders may be used in lieu of asphalt material. These mulch binders shall be applied according to the manufacturer's specifications through the

asphalt spray system or by agricultural crop sprayer.

Wood cellulose fiber mulch shall be applied on slopes steeper than 1½ to 1 at the rate of 1,500 lb. per acre (1 680 kg per ha).

Fertilizer shall be applied at the rate of 800 lb. per acre (900 kg per ha) of 10-20-10 fertilizer or equivalent.

Lime application rate will be determined by the Engineer based upon pH test conducted in accordance with MP 700.04.10.

- ii. Wood chips, recovered from clearing and grubbing operations, or bark will be acceptable as a mulch for seeding and shall be used at a rate of 35 cu. yd. per acre (66 cubic meters per hectare) in lieu of straw or hay.
- iii. Mulch Alone--For embankments or cuts 1½ to 1 or flatter, susceptible to critical erosion during periods of cold weather, the Engineer may require a two ton per acre (4.5 Mg per ha) application of straw or hay mulch for temporary erosion control and later seeding. Asphalt for anchoring mulch shall be at the rate of 50 gal. per ton (210 L per Mg) of mulch. The straw or hay may be rolled immediately with a sheep foot roller to anchor the mulch in lieu of using asphalt. A chemical mulch binder may be used for anchoring mulch in accordance with the provisions in paragraph i. above. When the weather becomes favorable in the spring, these areas shall be seeded using the normal application rates of seed, fertilizer and lime. If additional mulch is needed, wood cellulose fiber, hay or straw shall be used; the rate of application and areas to be mulched with wood cellulose fiber, hay or straw shall be as determined by the Engineer.

642.6-TEMPORARY PIPE, CONTOUR DITCHES, BERMS, SLOPE DRAINS, DITCH CHECKS AND SILT FENCE:

Temporary pipe and contour ditching shall be provided as necessary to control erosion.

Prior to suspension of construction operations for any appreciable length of time due to seasonal or other conditions, the Contractor shall shape the top of earthwork in such a manner as to permit and facilitate the runoff of rain water and shall construct earth berms along the top edges of embankments to intercept runoff water. The berm construction shall not be permitted to decrease the stability of the embankment section. In addition, the Contractor shall construct a berm at the end of each day's operation at the top edges of the embankment.

Temporary slope drains shall be provided to accommodate the runoff water intercepted above. These drains shall be located as needed and at no greater than 500 ft. (150 m) intervals.

Silt fence or bales of hay or straw shall be used to control erosion and trap sediment as required. Ditch checks shall be constructed in cut or median ditches by installing silt fence, anchoring bales of hay or straw, or by using wood, plywood, logs, steel, or other devices to control velocity and to aid in

642.7

sediment control. Each bale of hay or straw used for the above purpose shall weigh a minimum of 50 pounds (23 kg).

Engineering fabric for silt fence shall be supported on wood or steel fence posts, wood stakes or other supports approved by the Engineer. The center to center spacing of the supports shall be no more than 10 feet (3 meters). A full length trench, at least 6 inches deep by 6 inches wide (150 mm by 150 mm), shall be excavated adjacent to the proposed barrier on the upslope side.

The fabric shall be placed to provide a minimum of 8 inches (200 mm) of fabric extending into and conforming to the lines of the trench. The fabric shall be attached, on the upslope side, to the supports by metal staples, nails or other suitable means.

The trench, with fabric in place, shall then be backfilled with the excavated material and compacted so as to provide stable anchorage.

642.7-METHOD OF MEASUREMENT:

The work will be measured for payment at the unit bid prices for the items specified in 642.9.

Berms constructed prior to suspension of construction operations and slope drains will be measured in linear feet (meters); check dams will be measured by the unit; sediment traps, ponds, or dams and sediment removal will be measured by the cubic yard (meter); for sediment dams, risers will be measured by the unit and conduit for principal spillway under the dam will be measured in linear feet (meters) and included under Item 642008-*; seed will be measured by the pound (kilogram); straw, hay and wood cellulose fiber mulch will be measured by the ton (megagram); wood chips or bark mulch will be measured by the cubic yard (meter); fertilizer and agricultural limestone will be measured by the ton (megagram); matting will be measured by the square yard (meter); contour ditching will be measured by the linear foot (meter). Measurements will be made on the surface of the work done when applicable.

Asphalt for anchoring mulch or other chemical binders will not be measured separately, but their cost shall be included in the unit price bid for mulch. Cereal rye or cereal wheat added to Type D mixture in fall seeding will not be included for payment but its cost shall be included in the unit prices in 642.9.

Temporary pipe will be measured by the linear foot (meter) complete and in place. If the Contractor elects to utilize a series of small pipes in lieu of one large pipe, measurement for payment will be made only for a length necessary to extend one conduit under the haul road or sediment dam.

Berms constructed at the end of each day's operation will not be measured for payment but their cost shall be included in the unit bid price for Item 207001-*, "Unclassified Excavation."

Ditch checks will be measured by the unit except when constructed of hay or straw bales or silt fence. Hay or straw bales or silt fence used in ditch checks and other areas for erosion control will be measured by each and linear foot (meter), respectively.

Wood chips or bark will be measured by the cubic yard (meter). It is

assumed that 17.5 cubic yards (14.75 cubic meters) of chips or bark are equal to one ton (megagram) of straw for seeding. Wood chips or bark mulch will be measured by the truck load or other loose volume measurement, and payment will be made on a one ton (megagram) equivalent of straw for each 17.5 cubic yards (14.75 cubic meters) of wood chips or bark mulch.

Quantities reseeded, refertilized, or remulched will be measured and included for payment.

The bid price for fertilizer shall be based on 10-20-10 type. When other types of fertilizer are used, pay quantities will be determined using the following table:

TYPE OF FERTILIZER	ACTUAL QUANTITY USED POUNDS (kg)	PAY QUANTITY POUNDS (kg)
5-10-5	100	50
8-16-8	100	80
10-20-10	100	100
12-24-12	100	120
15-30-15	100	150

When fertilizer types other than those shown above are used, the relationship between the pay quantity and the actual quantity used will be established by the Engineer.

Silt fence will be measured by the linear foot (meter) at the bottom of the fence, excluding laps. Decomposed or ineffective fabric in the silt fence which is required to be replaced after six months from the installation date will be measured and paid for, however, such replacement prior to six months after installation will not be measured for payment.

In the event that temporary erosion and pollution control measures are required due to the Contractor's negligence, carelessness, or failure to install permanent controls as a part of the work as scheduled, or as ordered by the Engineer, such work shall be performed by the Contractor at their own expense.

Temporary erosion and pollution control work required, which is not attributed to the Contractor's negligence, carelessness or failure to install permanent controls, shall be performed as ordered by the Engineer. Where the work to be performed is not attributed to the Contractor's negligence, carelessness or failure to install permanent controls and falls within the Specifications for a work item that has a contract price, the units of work will be paid for at the proper contract price. Should the work not be comparable to the project work under the applicable contract items, the Contractor shall perform the work in accordance with 104.3.

In case of repeated failure on the part of the Contractor to control erosion, pollution, or siltation, the Engineer reserves the right to employ outside

642.8

assistance or to use their own forces to provide the necessary corrective measures. Such incurred direct costs plus project engineering costs will be charged to the Contractor and appropriate deductions made from the Contractor's monthly progress estimate.

Temporary pollution control may include construction work outside the right-of-way where such work is necessary as a result of roadway construction such as borrow pit and waste site operations, haul roads and equipment storage sites.

642.8-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid at the contract unit prices bid for the items listed below, which prices and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work, including necessary maintenance, and removal where applicable.

* Sequence number

643 THROUGH 650-BLANK**SECTION 651
FURNISHING AND PLACING TOPSOIL****651.1-DESCRIPTION:**

This work shall consist of acquiring sites outside the right-of-way from which topsoil can be obtained and the hauling and placing of such material, or hauling and placing of topsoil from stockpiles within the right-of-way, all in accordance with these Specifications and at locations indicated on the Plans or designated by the Engineer.

651.2-MATERIALS:

Topsoil shall consist of the uppermost layers of fertile and friable soil that contains humus material. This material varies in thickness in accordance with soil groups and usually possesses a darker color than the subsoil. The texture of the topsoil may vary within the range of natural loam, silty clay loam, and sandy loam. **Acceptable topsoil shall contain organic matter in the range of 1.5 percent of 20 percent.**

CONSTRUCTION METHODS**651.3-STRIPPING TOPSOIL:**

Prior to removal from the site, the soil will be tested by the Division to determine the humus and nutrient value. Care shall be exercised as to the depth of stripping, and any loads with an excess of subsoil shall be discarded. The Contractor shall mow or otherwise remove all heavy grass, weeds, or other vegetation over the areas before stripping. Approval by the Engineer must be obtained prior to transporting any material from the stripping site.

651.4-TRANSPORTING:

Topsoil material shall not be placed until the entire roadway (including surfacing) has been completed, unless otherwise provided for on the Plans or approved in writing. During hauling operations, the surface of the highway shall be kept reasonably clean to avoid creating a traffic hazard.

651.5-PLACING AND MANIPULATING:

Areas to be topsoiled shall be brought reasonably close to the lines and grades shown on the Plans or established by the Engineer.

The Contractor shall scarify the surface of the subsoil before the topsoil is placed, unless otherwise permitted, for bonding the topsoil layer with the subsoil.

Scarification shall be accomplished by disking, harrowing, raking, or other

651.6

approved methods. Depressions and ridges formed by construction equipment, during final grading or scarifying, shall be parallel to the contours.

Topsoil shall not be spread to a greater depth than that required to make the work conform to the natural terrain after shrinkage and settlement have taken place. After spreading the soil, all deleterious materials (large lumps or clods, brush, litter, or other foreign material, and stones exceeding 2 inches (50 mm) approximately in any dimension) shall be raked up and removed from the site.

The Contractor shall take all reasonable precautions to avoid injury to existing plant growth, structures, and roadway surface.

651.6-METHOD OF MEASUREMENT:

The quantity of work done will be measured in cubic yards (meters) of "Furnishing and Placing Topsoil" or "Placing Stockpiled Topsoil", which shall be the material actually removed from previously selected site or sites outside the right-of-way of from stockpiles within the right-of-way, and acceptably placed and spread on the areas designated to receive it, as determined from the net total of load tickets of vehicles.

651.7-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

No separate payment will be made for stripping topsoil within the right-of-way limits and transporting or stockpiling of such material.

651.8-PAY ITEMS:

SECTION 652

SEEDING AND MULCHING

652.1-DESCRIPTION:

This work shall cover all operations incidental to the establishment of grass and legume vegetation, including the furnishing and sowing of seed, furnishing and applying fertilizer, agricultural limestone, and mulch material, all in accordance with these Specifications and at locations indicated on the Plans or designated by the Engineer.

652.2-MATERIALS:

Materials shall meet the requirements in the following Subsections of Division 700:

MATERIAL	SUBSECTION
Ground Agricultural Limestone	715.25
Fertilizers	715.26
Mulch Materials	715.27
Inoculating Bacteria	715.29
Matting for Erosion Control	715.24
Water	*

*Water shall be reasonably free from injurious chemicals and other toxic substances harmful to plant life. The source of water used is subject to the approval of the Engineer.

Temporary seed, such as annual ryegrass (Italian ryegrass) and weeping lovegrass, used in the seed mixtures B, C, or D, shall be of a commercial grade meeting the requirements of the State Seed Law. Temporary seed labeled with the notation "germination below standard" shall not be used. Temporary seed shall not be used after one year from date of germination test shown on the label.

Seed other than that specified above shall meet the requirements of 715.28.

Asphalt for anchoring mulch shall be of a commercial grade. Chemical mulch binders shall conform to the requirements in 715.27.1.

Topsoil, if called for, shall conform to the requirements in 651. All materials will be subject to approval or rejection, in part or in whole.

CONSTRUCTION METHODS

652.3-SEASON OF WORK:

Permanent seeding or second and third seeding following the original

652.4

seeding, under 652, shall be performed between the dates of March 1 to June 15 and August 1 to October 15. Seeding under 642 shall be applied following construction at any time the weather will allow seeding equipment to operate; without regard to seasons.

652.4-AREA PREPARATION FOR SEEDING AND MULCHING:

Seeding and mulching shall not be applied until the specified areas have been brought to lines and grades shown on the Plans. Topsoil, when called for, shall be spread to the depths indicated on the Plans.

The application rate for agricultural limestone will be determined by a pH test after cuts and embankments are completed just prior to seeding. The Plans will show the estimated tons (megagrams) of lime needed for the job based on general knowledge of the soils in the area. The final application rate will be determined by the Engineer based on the pH test, conducted in accordance with MP 700.04.10.

Interchanges, medians and similar areas with 3 to 1 slope or flatter, excluding areas involving subsurface drainage from base course material, shall be scarified sufficiently to produce a seed bed as directed by the Engineer. All large sticks, brush, loose roots, stones exceeding 2 inches (50 mm) approximately in any dimension, and other debris shall be removed prior to seeding operations. The area shall be back dragged to eliminate depressions, ruts, or equipment track marks on slopes. Seed bed preparation will not be necessary on slopes steeper than 3 to 1.

Preparation of Lawn Type Area for Seeding: All areas to be seeded to "Type C-2" lawn mixture, and "Type C-1" mixture in rest areas shall be fine graded. The finished grade shall be uniform and free of irregularities or water pockets. The finished grade shall be free of weed and plant growth, stones over 1 in. (25 mm) in diameter, or other debris. This debris will be disposed of as directed by the Engineer. Immediately prior to seeding, all areas shall be cultivated to provide a reasonably firm but friable seedbed. The depth of tillage shall be 3 inches (75 mm) or as directed by the Engineer. Limestone as required and fertilizer as specified shall be worked into the upper 3 inches (75 mm) of the seedbed before seeding.

652.5-SOWING SEED:

Immediately following area preparation, seed shall be sown. Legume seed shall be inoculated with approved cultures, in accordance with the instruction of the manufacturer. When using a hydroseeder, the inoculant shall be increased to five times the normal rate.

Seed shall be sown by approved methods which provide for uniform distribution of seed. Rates of application and type of seed mixture shall be in accordance with Table 652.5 unless otherwise specified on the Plans.

For lawn areas, the broadcast seeding shall be made in two applications, using one half the seed each time and the second sowing to be at right angles to the first. After broadcasting or otherwise applying the seed, the seedbed shall be firmed by means of a roller or cultipacker.

TABLE 652.5-SEED MIXTURES

VARIETY OF SEED	Type B	Type C		Type D	Type L
		C-1	C-2		
	Medians, Shoulders (Ditch Slope) Waterways, and Mowable Areas of Interchange	Coarse Lawn Grass ***** For Use in Urban and Rest Area Locations	Fine Lawn Grass ***** For Use where a Fine Lawn is Desired	Cut and Fill Slopes ***** (Including Benches and Bifurcated Median)	All areas
	Lb. per acre (kg per ha)	Lb. per acre (kg per ha)	Lb. per acre (kg per ha)	Lb. per acre (kg per ha)	
Kentucky 31 fescue	65 (72.9)	45 (50.4)		20 (22.4)	
Red fescue (Pennlawn)	20 (22.4)	20 (22.4)	20 (22.4)	20 (22.4)	41 (46.0)
Kentucky bluegrass		25 (28.0)	40 (44.8)		
Merion bluegrass			30 (33.6)		
Crownvetch				20 (22.4)	
Hard Fescue Mixture***					63 (70.6)
White Dutch Clover	3 (3.4)				
Annual ryegrass August 1 to May 15 or Weeping lovegrass May 15 to August 1	7 (7.8) 3 (3.4)	7 (7.8) 3 (3.4)	7 (7.8) 	7 (7.8) 3 (3.4)	12 (13.5) 5 (5.6)

* Areas will be considered mowable when slopes are 3 to 1 or flatter. Type C-1 and C-2 seed mixtures shall be used in all urban, suburban, and rest

652.6

areas where lawn type turf is desired with moving maintenance intended.

C-2 lawn mixture shall be used along sidewalks, adjacent to private lawns.

***A combination of approved certified varieties with no one variety exceeding 50% of the total hard fescue component.

Reseeding, Refertilizing and Remulching: Any area failing to establish a stand due to weather conditions or adverse soil conditions shall bereseeded, refertilized and remulched as directed by the Engineer.

652.6-APPLYING MULCH AND FERTILIZER:

652.6.1-General: Whenever permanent or temporary seeding is made on bare soil or newly completed construction work, the following criteria shall be followed in regard to mulching.

Straw mulch (including hay) shall be used on all areas and slopes 1½ to 1 or flatter. Wood cellulose fiber mulch shall be used on cut slopes steeper than 1½ to 1. The Engineer may make adjustments in the type of mulch to meet local conditions on the job.

The seed may be sown before or after the straw is spread. However, when the seed is sown first, the straw shall be placed within 24 hours.

When permanent seeding follows a temporary cover crop, wood cellulose fiber mulch shall be used and the quantity of mulch shall be determined by the amount of living and dead plant residue on the soil surface in accordance with 652.6.3.2.

Where the temporary seeding has been destroyed by subsequent construction, the mulch will be the same type and amount as required for bare soil or new construction.

652.6.2-Straw Mulch: Straw shall be applied at the rate of approximately two tons per acre (4.5 Mg per hectare). The straw mulch may be anchored with 100 gal. of asphalt per acre (93.5 L of asphalt per hectare). The asphalt may be sprayed on the straw as it leaves the blower or it may be applied in a separate operation. The Contractor shall be responsible for any damage to the structures from the asphalt spray.

Straw mulch around buildings, sidewalks or other structures may be held in place with a form of netting or may be sprayed with asphalt by hand while protecting the structures from the asphalt spray.

Other types of chemical mulch binders may be substituted for asphalt material. These mulch binders shall be applied according to the manufacturers' specifications through the asphalt spray system or by an agricultural crop sprayer.

652.6.3-Hydraulic Application of Wood Cellulose Fiber as a Mulching Agent:

652.6.3.1-Equipment: Hydraulic equipment shall be used for the

application of a slurry of fertilizer, seed, prepared wood cellulose fiber, and water. This equipment shall have a built-in agitation system with an operating capacity sufficient to agitate, suspend, and homogeneously mix a slurry of the specified amount of fiber, fertilizer, seed, and water. The slurry distribution lines shall be large enough to prevent stoppage. This discharge line shall be equipped with a set of hydraulic spray nozzles which will provide even distribution of the mixture or slurry in the various areas to be seeded. The slurry tank shall have a minimum capacity of 1,000 gal (3 750 L). and shall be mounted on a traveling unit which may be either self-propelled or drawn, with a separate unit which will place the slurry tank and spray nozzles within sufficient proximity to the areas to be seeded to provide uniform distribution without waste.

652.6.3.2-Preparation of Slurry and Application of Fertilizer, Seed, and Mulch: Wood cellulose fiber shall be applied at a minimum rate of 1,500 lbs. (1 680 kg) net dry weight per acre (ha) when seeding bare soil or new construction. When seeding into a residue or growth where temporary seeding has previously been performed, the rate will be determined by the Engineer, usually 1,000 lbs. net dry weight per acre (1 120 kg per ha). The seed, fertilizer, wood cellulose fiber, and water shall all be combined into the slurry tank for distribution of all ingredients in one operation by the hydraulic seeding method. The agitator shall be operating at a rate sufficient to keep all materials in suspension at the time such material is added. Seed shall be added first, shall be thoroughly mixed, and the fertilizer then added and put into suspension. When the tank is 40 percent full, the mulch material may be added and shall be in complete suspension by the time the tank is 75 percent full. Such increased mixing speed as is necessary for putting the entire admixture in suspension shall be maintained until the tank is emptied. Spraying may commence at such time as the full complement of water has been mixed into the slurry. It is the intent of this Specification to maintain the slurry, during the spraying operation, as a homogenous mixture of suspended solids in the tank until the tank is emptied.

652.6.4-Fertilizer: The kind and amount of fertilizer per acre (ha) shall consist of any type with 1-2-1 ratio (nitrogen, phosphoric acid, and potash) providing the minimum nutrient equivalent of 1,000 lb. (450 kg) of 10-20-10. In addition, 300 lb. per acre (335 kg per hectare) of slow release urea formaldehyde fertilizer shall be added whenever second step seeding and fertilizing is not feasible due to the Contract completion date. When hydraulic seeding methods are used, the fertilizer shall be applied concurrently with the seeding and mulching operation as part of the slurry mix. When commercial fertilizer is applied by the spray or hydraulic method, it need not be worked into the soil.

Fertilizer applications for second and third step seeding shall be in accordance with 652.8.

652.6.5

652.6.5-Wood Chips: Wood chips, recovered from clearing and grubbing operations, or bark will be acceptable as a mulch for seeding and shall be used at a rate of 35 cu. yd. per acre (66 cubic meters per hectare) in lieu of straw or hay.

652.7-MAINTENANCE OF SEEDED AND MULCHED AREAS:

The Contractor shall maintain all seeded areas until final acceptance of the project. All areas shall be protected from equipment traffic and any damaged areas shall be repaired and reseeded.

652.8-SECOND AND THIRD STEP SEEDING, FERTILIZING AND MULCHING:

The Engineer will require second or third step seeding, or both, depending upon the completion date and estimated completion time of any remaining items on the project.

The second application of fertilizer, seed and mulch shall be applied as directed by the Engineer. The application rates will be based on the stand of grass, severity of erosion and condition or growth of grass as described. Spring seedings shall be refertilized and reseeded as needed in the fall from August 15 to October 15. Fall seeded areas shall be given a second step seeding and fertilizing, as required, the following spring from March 15, to May 15.

The following shall be used as a guide for second step application:

- i. For areas with less than 50 percent stand or subject to sever erosion, apply the complete amount of seed, fertilizer, and mulch (wood cellulose fiber) as specified in the original seeding.
- ii. For areas with over 50 percent of grass and slight to moderate erosion, apply one half the original fertilizer and seed. If erosion is a problem apply one half the original wood fiber mulch.

The third step seeding, mulching, and fertilizing shall consist of spot application on areas not showing a satisfactory stand after the second step application. The quantity of material will be determined on the same basis as for the second step application. No urea formaldehyde fertilizer will be needed for third step seeding.

652.9-METHOD OF MEASUREMENT:

Ground agricultural limestone, fertilizer, and mulch will be measured by the ton (megagram). Seed will be measured by the pound (kilogram).

Wood chips or bark will be measured by the cubic yard (meter). It is assumed that 17.5 cu. yd. (14.75 cu. m) of chips or bark are equal to one ton (megagram) of straw for seeding. Wood chips or bark mulch will be measured by truck load or other loose volume measurement, and payment will be made on one ton (megagram) equivalent of straw for each 17.5 cu. yd. (14.75 cu. m) of wood chips or bark mulch.

Second and third step seeding operations will be measured and included for

payment under items in 652.11.

Asphalt for anchoring mulch, or other chemical mulch binders, will not be measured separately, but their cost shall be included in the unit price bid for mulch.

652.10-BASIS OF PAYMENT:

The quantities determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be considered full compensation for furnishing all materials and performing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

Topsoil will be measured and paid for in accordance with the provisions of 651.

The bid price for fertilizer is based on 10-20-10 type. When other types of fertilizer are used, pay quantities will be determined using the following table.

TYPE OF FERTILIZER	ACTUAL QUANTITY USED POUNDS (kg)	PAY QUANTITY POUNDS (kg)
5-10-5	100	50
8-16-8	100	80
10-20-10	100	100
12-24-12	100	120
15-30-15	100	150

When fertilizer types other than those shown above are used, the relationship between the pay quantity and the actual quantity used will be established by the Engineer.

SECTION 653

VINE AND GROUND COVER PLANTING

653.1-DESCRIPTION:

This work shall consist of furnishing and planting vine and ground cover of the species called for on the Plans and in the manner prescribed or as directed by the Engineer.

653.2-MATERIALS

653.2.1-Topsoil: Topsoil shall conform to the applicable requirements of 651.

653.2.2-Water: Water shall conform to the requirements of 652.2.

653.2.3-Ground Agricultural Limestone: Ground agricultural limestone shall conform to the requirements of 715.25.

653.2.4-Fertilizer: Fertilizer for landscape plantings shall conform to the applicable requirements of 715.26.

653.2.5-Mulch and Mulch Anchor: Mulch material for landscape plantings shall conform to the requirements of 715.27.2.

653.2.6-Vine and Ground Cover Plants: Vine and ground cover plants shall conform to the requirements specified of 715.33. The vine and ground cover plants shall be true to the type and size indicated on the Plans.

CONSTRUCTION METHODS

653.3-PLANTING OF VINES AND GROUND COVER PLANTS:

The method of planting vine and ground cover plants will be determined to a great extent by the site conditions, namely soil, slope, and type of cover. Two methods of planting ground cover are basically row planting and bed planting, as shown on the Plans.

Row Planting--On areas covered with grass or weed mass, the equivalent of one square foot (300 mm) of sod including roots shall be removed and replaced on the lower side of the plant hole to help retain moisture runoff. The foot (300 mm) square area around each individual plant shall be mulched as directed by the Engineer.

Bed Planting--All plant beds shall be free of weeds and grass prior to planting. The bed preparation can be accomplished with either herbicide spray or tillage as described on the Plans.

Bed areas shall be mulched as shown on the Plans.

Plant backfill mixture for vines and ground covers shall be three parts top

soil to one part peat moss with one hundred lb. (45.5 kg) fertilizer added per cubic yard (meter) of backfill. For plants in containers or pots three inch (75 mm) size or less, the backfill mix shall be applied at the rate of one pint per plant. For plants in larger containers, the planting specifications will be shown on the Plans. Any other additives will be shown on the Plans. In loose shale or sand without a sod cover, selection of plant location shall be where the soil is stable and not subject to rapid accumulation or erosion. On steep banks 1½ to 1 or steeper, a slit shall be opened large enough to receive the plant roots and the replaced soil tamped leaving a slight depression to collect moisture. On slopes 2 to 1 or flatter, a small rain basin shall be formed by tamping with the heel and placing sod or excess soil on the slopes below the plant. Plants shall be watered during planting operations as directed by the Engineer.

The Contractor shall furnish material and mark location of all vine and ground cover plants for future reference. A row shall be identified by a stake at each end and a bed or mass identified by stakes around the perimeter. Wire stakes with flags are acceptable as markers.

Planting Season: All initial planting shall be performed between March 15 and July 1.

653.4-CARE OF VINES AND GROUND COVER:

The Contractor shall maintain the plants in a healthy, living condition during the life of the contract, and shall maintain an adequate supply of moisture in the root zone at all times.

The Contractor and the Engineer shall make a monthly inspection of the plantings to determine the need for maintenance and water during the first growing season, June through October. Any maintenance determined necessary shall be taken care of during the two-week period immediately following the inspection. When moisture in the root zone is deficient, watering shall be started within 48 hours with sufficient labor and equipment to completely water all the plants within a two-week period unless otherwise directed by the Engineer. Other maintenance required during the contract period shall include:

- i. The control of weeds and grass growth in beds and around individual plants.
- ii. Protect plants from damage by insects and diseases.
- iii. Any other practices necessary to maintain the plants in a healthy, live condition.

653.5-REPLACEMENT OF VINES AND GROUND COVER:

Between August 1 and 10 following the initial planting period, the Contractor and Engineer will make an inspection of all vines and ground cover plants to determine the replacement necessary.

If it is estimated that 85 percent or more of the Plan quantity of any individual item in a specific area is living, healthy and in good growing condition, replacements will not be required for that area. Any specific grouping shall have a reasonable distribution of live plants and the allowable

653.6

15 percent loss shall not be concentrated.

If it is determined there is a loss of more than 15 percent in any specific area, the Contractor shall be required to replace all the dead, missing or defective plants in the specific area. All replacements shall be completed during the period September 1 to 15 and maintained until the completion of the Contract.

653.6-CARE DURING AND AFTER DELIVERY:

There is a tendency for bare-root plants to dry out during shipment and during the planting operation; therefore it is important that the roots of all plant material shall be kept moist during shipment and during their planting period.

653.7-METHOD OF MEASUREMENT:

Measurement of vines and ground cover plants shall be the number of plants originally planted, providing a survival of 85 percent was established, or the necessary replacements were made as directed.

The final acceptance and payment for any particular plant will be made after completing proper care and replacement as described in 653.4 and 653.5.

Water for maintenance during the period of establishment will be measured by the gallon (liter), expressed in thousand-gallon (liter) units.

653.8-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials, including water required during the process of planting, topsoil, ground limestone, fertilizer, and mulch, and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

Maintenance work other than watering shall be included in the contract unit price bid for each plant.

The accepted quantities of watering during the period of establishment will be paid for at the contract unit price per 1,000 gal. (L), which price shall be full compensation for furnishing, delivering, applying and performing all other work. No payment will be made for watering at the time of original planting or when planting replacements.

653.9-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
653001-*	VINES, FAST GROWING, "***key number, ***size"	EACH
653002-*	VINES, MEDIUM GROWING, "***key number, ***size"	EACH

* Sequence number

****Division's "Vines and Ground Cover List"** in effect on the date of the invitation for bids. Copies of the complete "Vine and Ground Cover List" in effect on any date may be obtained from the Division.

******* Size designations will be in accordance with the "American Standards for Nursery Stock".

SECTION 654

TREE AND SHRUB PLANTING

654.1-DESCRIPTION:

This work shall consist of furnishing, delivering, and planting nursery-grown or collected plants, in accordance with these Specifications and at locations shown on the Plans or designated by the Engineer. This work shall include the furnishing of topsoil and related materials together with all other work including clean-up of planted areas.

654.2-MATERIALS:

654.2.1-Topsoil: Topsoil for plant backfill shall conform to the applicable requirements of [651](#).

654.2.2-Water: Water shall conform to the requirements in [652.2](#).

654.2.3-Ground Agricultural Limestone: Ground agricultural limestone shall conform to the requirements of [715.25](#).

654.2.4-Fertilizer: Fertilizer for landscape plantings shall conform to the applicable requirements of [715.26](#).

654.2.5-Mulch and Mulch Anchor: Mulch for landscape plantings shall conform to the requirements of [715.27.2](#).

654.2.6-Trees and Shrubs: Trees and shrubs shall conform to the requirements of [715.35](#). The trees and shrubs shall be true to the type and size indicated on the Plans.

Collected plants may be used in place of nursery grown plants only when called for on the plans.

654.2.7-Tree Paint: Tree paint shall conform to the requirements of [715.36](#).

654.2.8-Miscellaneous Materials: Wire, hose, stakes, tree wrapping paper, anti-desiccant spray, and other incidental materials shall conform to the

654.3

requirements of 715.37.

CONSTRUCTION METHODS

654.3-INSPECTION AND DELIVERY OF PLANT MATERIAL:

The Contractor shall notify the Engineer at least five days in advance of digging or shipping of plants from the nursery or collecting source. All plants will be subject to inspection where growing in the nurseries or collecting areas.

All plants shall be dug with care by experienced workmen, retaining essential roots and avoiding mechanical damage to root systems. All plants shall arrive with their roots in a moist and healthy condition. Each species or variety shall be handled and packaged in an approved manner and as required by soil and climatic conditions at the time of digging, with due regard to conditions of shipment and time to be consumed in transit and delivery. All plants shall be legibly tagged with name and size. All balled and burlapped plants shall be handled by the earth ball only.

All evergreen and all deciduous trees, regardless of size, and all other plants so designated on the Plans shall be balled and burlapped for shipment. All such plants shall be so dug and transported as to provide and retain a firm ball of earth. All balled and all bare-root material shall be adequately protected from severe changes in temperature and wind-burn while in transit.

Upon delivery to the Project, plants will be inspected for number, type, species, size, quality, and condition. Defects or injuries, such as dried out or broken roots and tops, evidence of "sweating", mildew, freezing, or broken or manufactured rootballs, will be cause for rejection, and immediate steps shall be taken to replace rejected plants.

654.4-CARE AFTER DELIVERY:

Plant material delivered to the Project and accepted shall be planted immediately, or "heeled-in" in moist soil or other approved moist material in a manner as shown on the Plans. All "heeled-in" plants shall be kept moist and protected until planted.

654.5-DIGGING HOLES FOR PLANTS:

Planting holes shall be excavated according to the following table:

PLANTING HOLE DIAMETER			
Rootball Inches (mm) (Specified)	Planting Hole Inches (mm) (Approximate)	Rootball Inches (mm) (Specified)	Panting Hole Inches (mm) (Approximate)
8 (200 mm)	20 (500 mm)		
10 (250 mm)	22 (550 mm)	28 (700 mm)	49 (1 225 mm)
12 (300 mm)	24 (600 mm)	32 (800 mm)	56 (1 400 mm)
14 (350 mm)	28 (700 mm)	38 (950 mm)	66 (1 650 mm)
16 (400 mm)	32 (800 mm)	42 (1 50 mm)	73 (1 825 mm)
18 (450 mm)	34 (850 mm)	48 (1 200 mm)	84 (2 100 mm)
20 (500 mm)	36 (900 mm)	54 (1 350 mm)	94 (2 350 mm)
22 (550 mm)	38 (950 mm)	60 (1 500 mm)	105 (2 625 mm)
24 (600 mm)	42 (1 050 mm)	72 (1 800 mm)	126 (3 150 mm)

The depth of the hole shall extend 8 inches (200 mm) below the depth of the rootball. During normal weather conditions, digging and planting holes may be allowed as much as two weeks in advance of planting. During hot dry weather, the planting holes shall be dug just prior to planting. When holes present a hazard along the highway, they should be dug immediately prior to planting.

Planting holes for container grown plants shall be dug to the size required for the equivalent balled and burlapped plants.

654.6-PLANT BACKFILL:

All backfill for planting shall be four parts topsoil mixed with one part peat moss (loose measurement) or other approved additive. Eight pounds (4.75 kg) of fertilizer shall be added per cubic yard (meter) of backfill and bulk mixed with the topsoil and peat moss.

Any adjustment needed in the pH reaction of the backfill material will be specified in the Plans.

The rate of fertilizer application for individual plant replacement shall be as follows:

Deciduous trees—1 lb/in. (0.02 kg/mm) diameter

654.7

Evergreen trees--One pound (0.5 kg) per tree

Small flowering trees--One pound (0.5 kg) per tree

Shrubs--One-half pound (0.25 kg) per plant.

No backfill in a frozen or muddy condition shall be used.

654.7-PLANTING:

654.7.1-Planting Season: Planting season for balled and burlapped evergreens shall begin September 15. Planting season for all deciduous balled and burlapped plants and all bare root plants shall begin October 15. No bare root plants shall be planted during freezing temperature. The cut-off date for fall planting and the starting date for spring planting will be determined by the Engineer. All initial planting shall be completed by May 20.

Any extension of time granted due to a delay in giving notice to proceed, as indicated in the Proposal, is not intended to extend the initial planting deadline of May 20. It is the intent of this specification that all plants shall be in the planting holes by May 20. Should there be a delay in giving notice to proceed, the staking, guying, wrapping, and other incidental items may be deferred by the Engineer until all plants are placed in the planting holes. Such approval of the planting procedure will not relieve the Contractor of their responsibility for loss of any plants.

654.7.2-Planting Method: All balled and burlapped plants shall be planted so the top of the ball is slightly above the natural ground level to allow for normal settlement unless otherwise specified on the Plans. When planting beds, the individual plants shall be selected and arranged according to spread and height to present a uniform appearance.

Backfill material under the rootball or roots shall be tamped prior to placing the plant in the hole.

When planting balled and burlapped plants, the burlap and twine may be left intact; however, any twine attached to the stem and considered to have a girdling or detrimental effect shall be removed. Bare-rooted plants shall be placed in the planting holes with the roots spread out in a natural position while the specified backfill is placed. Nonplantable containers shall be carefully removed from all container grown or potted plants immediately prior to planting.

Planting beds shall be prepared by destroying the existing vegetation before excavating the planting holes. Recommendations for control of existing vegetation will be shown on the Plans.

Sufficient amounts of water, without puddling, shall be used in the process of planting to settle the backfill material around the roots or ball. Additional backfill material shall be placed and further compaction accomplished by tamping. This watering is not to be confused with the maintenance procedure in 654.14.1.

During the initial planting period, September 15 to May 20, any plant determined by the Engineer not to be in an acceptable growing condition, or

failing to meet other requirements of these specifications, shall be removed from the project and replaced immediately with nursery stock meeting the specifications. It is the intent of this specification that all plants shall be alive at the beginning of the growing season.

654.8-PRUNING:

Primarily, all dead and broken branches shall be removed from deciduous and evergreen plant material during the process of planting. Further pruning shall be carried on in accordance with the normal nursery practice or as directed by the Engineer. All cuts over 1 in. (25 mm) shall be painted with a tree paint.

654.9-STAKING AND GUYING:

All deciduous and evergreen trees and all ornamental flowering trees (including multiple stem) shall be staked in accordance with tree staking details shown on the Plans and to the satisfaction of the Engineer.

654.10-MULCHING:

Mulch material shall be furnished and placed around the plants as soon as possible after planting. However, during extremely wet periods, the application of mulch shall be delayed and placed as directed by the Engineer.

The mulch shall be applied in the saucer areas of individual trees and shrubs and over the entire area of shrub beds. Heavy mulches like woodchips and wood bark products shall be applied to a depth of 3 inches (75 mm). Light mulch material shall be applied 4 inches (100 mm) deep. When black polyethylene film is specified for weed control, the mulch depth shall be reduced to 2 inches (50 mm).

654.11-WRAPPING AND FOLIAGE PROTECTION:

The trunks of all deciduous and small flowering trees shall be wrapped with four inch (100 mm) waterproof sisal paper. The wrapping shall start from the ground and extend up the trunk in a spiral manner with one-third overlap, ending with one wrap above the lowest branch. The wrapping shall be neatly secured with binder twine at approximately 18-in spacings and at the top and bottom.

All evergreens shall be thoroughly sprayed at the nursery prior to delivery, with an anti-desiccant spray (protective emulsion) at the rate specified by the manufacturer. All deciduous trees and shrubs in any stage of leafing out, at the time of delivery, shall receive the anti-desiccant spray. Certification of this spray application will be required by the Division. Deciduous trees and shrubs that have leafed out while in the "healing-in" area will require the anti-desiccant spray before being transported to the planting site.

654.12-RAIN BASINS:

A shallow rain basin equal to the diameter of the planting hole shall be formed by shaping the soil around each tree or shrub and shall be maintained

654.13

until final inspection and acceptance of the work.

654.13-CLEAN-UP AFTER PLANTING:

After the planting has been completed, all planting sites shall be cleaned up. Subsoil, rock, excess topsoil, and other waste material shall be removed and disposed of as directed.

All holes dug and not used, or areas disturbed in attempting to find a suitable planting site, shall be refilled by the Contractor, and the area shall be restored to its original condition and reseeded.

654.14-CARE AND REPLACEMENT OF PLANTS:

654.14.1-Care: The Contractor shall maintain the plants in a healthy, living condition during the life of the Contract, which includes any warranty period indicated in the Contract, and shall maintain an adequate supply of moisture in the root zone at all times.

The Contractor and the Engineer shall make a monthly inspection of the plantings to determine the need for maintenance and water during the first growing season, June through October. Any maintenance determined necessary shall be taken care of during the two-week period immediately following the inspection. When moisture in the root zone is deficient, watering shall be started within 48 hours with sufficient labor and equipment to completely water all the plants within a two-week period unless otherwise directed by the Engineer.

Other maintenance required during the contract period shall include:

- i. The control of weed and grass growth, by destroying the top growth as well as roots, in plant beds and individual plant saucers.
- ii. Protect plants from damage by insects and diseases.
- iii. Repair rain collars and replace any lost mulch.
- iv. Maintain stakes and guys supporting trees, and any other practices necessary to maintain the plants in a healthy, living condition.

654.14.2-Replacement of Plants: The Contractor and the Engineer will make an inspection of the plantings between September 1 and 10 following the initial planting period, to determine the number of dead, missing or defective plants, for which replacement will be required.

During this fall replacement period, September 15 through November 30, all maintenance including stake and wire tightening, mulch replacement, rain collar repair, pruning or trimming, trunk wrapping, and removal of any wire tags shall be accomplished.

The replacement plants shall be planted in the same manner as the original plants with necessary backfill and mulch added to accomplish the job. The fertilizer shall be added in the hole prior to replacing the plant. However, when a plant has been lost due to poor drainage or other adverse soil condition, the replacement shall be planted at a more acceptable location, and the old site shall be restored to its original condition.

All replanting and maintenance shall be completed by November 30 for final acceptance of the Contract by December 15.

654.15-METHOD OF MEASUREMENT:

The quantity of plants to be paid for will be the number of living trees or shrubs planted in accordance with these Specifications and accepted. Only living plants in healthy condition at the time of final inspection will be accepted.

Progress payment for the initial planting of trees and shrubs will be based on the premise that 90 percent of the work has been completed when the plants have been completely planted. The remaining 10 percent withheld will be considered for maintenance, plant replacement, and for any delayed mulching when authorized by the Engineer. Retainage, from the amount determined as above, will be in accordance with 109.6.

The final acceptance and payment for any particular plant will be made after completing proper care and replacement as described in 654.14.

Water for maintenance during the period of establishment will be measured by the gallon (liter), expressed in thousand-gallon (liter) units.

654.16-BASIS OF PAYMENT:

The number of plants, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments will constitute full compensation for furnishing and delivering plants and all incidental materials including water required during the process of planting, topsoil, mulch, fertilizer, ground agricultural limestone, and additives; for planting, staking, pruning and for performing all the work prescribed in a workmanlike and acceptable manner, including all labor, equipment, tools, and incidentals necessary to complete the work.

Maintenance work other than watering will be included in the contract unit prices bid for each plant.

The accepted quantities of water used during the period of establishment will be paid for at the contract unit price per 1,000 gal. (L), which price shall be full compensation for furnishing, delivering, applying, and performing all other work. No payment will be made for watering at the time of original planting or when planting replacements.

654.17-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
654001-*	TREE, DECIDUOUS, "***key number, ***size"	EACH
654002-*	TREE, ORNAMENTAL FLOWERING, "***key number, ***size"	EACH
654003-*	SHRUB, DECIDUOUS, "***key number, ***size"	EACH
654004-*	SHRUB, EVERGREEN, "***key number, ***size"	EACH
654005-*	TREE, EVERGREEN, "***key number, ***size"	EACH
654006-*	WATER FOR PLANTS	THOUSAND GALLON (LITER)

* Sequence number

** The Key Numbers for plants are referenced to the Division's "trees and Shrubs List" in effect on the date of invitation for bids. Copies of the "Trees and Shrubs List" in effect on any date may be obtained from the Division.

*** Size designated will be in accordance with "American Standards for Nursery Stock".

SECTION 655

MATTING FOR EROSION CONTROL

655.1-DESCRIPTION:

This work shall consist of furnishing and placing erosion control matting in accordance with these specifications and at the locations shown on the plans or designated by the Engineer.

655.2-MATERIALS:

The matting shall meet the requirements specified in [715.24](#). Devices used to anchor the mat shall be as recommended by the manufacturer of the matting and be of sufficient strength and size to secure the mat until it is anchored by vegetation, siltation, etc.

CONSTRUCTION METHODS

655.3-PLACING:

The area to be covered shall be prepared as a fine seedbed, fertilized and seeded before the matting is applied.

The erosion control mat shall be placed and anchored in accordance with the recommendations of the manufacturer of the matting. The mat shall be adequately watered to firmly bond the mat to the soil and aid in the germination of the seed.

655.4-MAINTENANCE AND REPAIRS:

The Contractor shall maintain the areas upon which the matting is placed until all work on the Contract has been completed and accepted.

656.2.4

Maintenance shall include the repair of areas damaged by erosion, wind, fire, or other causes. Repair may include reestablishing the condition and grade of the soil, replacement of the matting, and refertilizing and reseeding in accordance with the applicable portions of 652.

655.5-METHOD OF MEASUREMENT:

The quantity of work done will be measured by the square yard (meter) of matting placed. Measurements will be made on the surface of the matting exclusive of laps and material that may have been placed in slots.

655.6-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

655.7-PAY ITEMS:

SECTION 656 SEEDLING PLANTING

656.1-DESCRIPTION:

This work shall consist of furnishing and planting seedlings of the species called for on the Plans and in the manner prescribed or as directed by the Engineer.

656.2-MATERIALS:

656.2.1-Topsoil: Topsoil shall conform to the applicable requirements of 651.

656.2.2-Water: Water shall conform to the requirements in 652.2.

656.2.3-Ground Agricultural Limestone: Ground agriculture limestone shall conform to the requirements in 715.25.

656.2.4-Fertilizer: Fertilizer for landscape plantings shall conform to the

656.2.5

applicable requirements in 715.26.

656.2.5-Seedling Plants: Seedling plants shall conform to the requirements specified in 715.34. The seedling plants shall be true to the type and size indicated on the Plans.

CONSTRUCTION METHODS

656.3-PLANTING SEEDLING PLANTS:

The method of planting seedling plants will be determined to a great extent by the site conditions, namely soil, slope, and type of cover. On areas covered with grass or weed mass, the equivalent of about one square foot (300 sq. mm) area shall be cleared, including roots. The cleared material shall be placed on the lower side of the plant hole to help retain moisture runoff. A hole large enough for the plant roots shall then be dug, and the plant placed and backfilled with one pint backfill mix and completed with excavated material. The soil then shall be packed around the roots with the foot or heel.

Plant backfill mixture for seedlings shall be three parts topsoil to one part peat moss, with 100 lbs. of fertilizer adder per cubic yard (60 kg of fertilizer adder per cubic meter) of backfill. Any other additives will be shown on the Plans. In loose shale or sand without sod cover, selection of plant location shall be where the soil is stable and not subject to rapid accumulation or erosion. On steep banks a slit shall be opened large enough to receive the plant roots and the replaced soil shall be tamped with the heel.

Seedling plants shall be individually mulched and watered during the planting operations as directed by the Engineer.

The Contractor shall furnish material and mark the location of all seedling plants for future reference. A row shall be identified by a stake at each end and a bed or mass identified by stakes around the perimeter. Wire stake flags will be accepted as markers.

656.4-REPLACEMENT OF SEEDLING PLANTS:

At the discretion of the Engineer, or in the event that it is determined that the survival is not satisfactory, replacement may be required. Only such replacements as are ordered and countered by the Engineer shall be made. All replacement planting shall be in accordance with the requirements of the Contract application to initial plantings.

656.5-CARE DURING AND AFTER DELIVERY:

There is a great tendency for bare-root plants to dry out during shipment and during the planting operation; therefore it is extremely important that the roots of all plant material shall be kept moist during shipment and during the construction period.

656.6-METHOD OF MEASUREMENT:

Measurement of seedling plants will be by the number of plants initially

planted in an acceptable manner and all such replacements as are ordered and planted in accordance with this Specification.

656.7-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit prices bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials, including water, topsoil, peat moss, limestone, fertilizer, and mulch, and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies and incidentals necessary to complete the work.

All replacements ordered by the Engineer will be paid for at the contract unit price for the item listed.

656.8-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
656001-*	SEEDLING, "***key number", "***size"	EACH

* Sequence number

** Key numbers for seedlings are referenced to the Division's "Seedling Plant List" in effect on the date of the invitation for bids. Copies of the complete "Seedling Plant List" in effect on any date may be obtained from the Division.

*** Size designated will be in accordance with the "American Standards for Nursery Stock".

SECTION 657 ROADSIDE SIGN SUPPORTS

657.1-DESCRIPTION:

This work shall consist of the fabrication and erection of all supports for roadside mounted signs in accordance with the requirements of the Plans and of these Specifications. This shall include the supports for all signs which are located outside of the shoulder and do not extend over the shoulder.

All details not specified or not shown on the Plans shall conform to the details and requirements set forth in the following specifications and publications:

- i. The Manual on Uniform Traffic Control Devices for Streets and Highways, latest issue, as printed by the Federal Highway Administration, U.S. Department of Transportation. (Referred to as the MUTCD).
- ii. Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals, latest issue, including revisions, American Association of State Highway and Transportation Officials.

657.2

657.2-MATERIALS:

Materials furnished by the Contractor shall be of new stock, shall be the product of reputable manufacturers of signing equipment, shall conform to the Division's Specifications, and shall meet the approval of the Engineer.

All materials shall conform to Division 700 of the Standard Specifications and specifically as follows. All referenced specifications for materials shall be understood to mean the latest available specifications and revisions at the time of award of the Contract.

657.2.1-Aluminum:

657.2.1.1-Tapered Tubular Supports: Supports shall be void of circumferential welding except at the base. Subject to the Engineer's approval, other alloys may be used in place of those called for. The Contractor shall submit, for approval of the Engineer, design calculations for the above substitutions prior to the fabrication of the supports.

Tapered tubular aluminum supports shall be fabricated from Alloy 6063-T6, ASTM B 221, or ASTM B 429. Taper of the supports shall be uniform and continuous from the base to the top of the support.

657.2.1.2-Structural Supports: Structural aluminum supports shall be of a standard wide-flange shape and of Alloy 6061-T6, conforming to ASTM B 308. Each support shall be fabricated from one piece of metal. Posts built up by welding short pieces together will be rejected. The support shall include a base plate which shall be designed for anchoring to a concrete footing with galvanized steel bolts as shown on the Plans.

657.2.1.3-Support Bases: Bases for roadside mounted signs shall be fabricated from either plates, Alloy 6061-T6, ASTM B 209, or from castings Alloy SG70B-T61, ASTM B 108, or Alloy SG70A-T6, ASTM B 26, or ASTM B 108. Only one of the above type bases will be used on a project. The underside of the bases shall be coated with an alkali-resistant bituminous paint.

657.2.1.4-Support Caps: Castings form aluminum support caps shall be Alloy S5A, ASTM B 26, or Alloy SG70A, ASTM B 26 or ASTM B 108 and shall be held in place by stainless steel set screws. The same type cap must be used throughout a project.

657.2.2-Steel: All steel items shall be galvanized in accordance to ASTM A 123 or ASTM A 153, unless otherwise specified.

657.2.2.1-Tapered Tubular Supports: Supports shall be void of circumferential welding except at the base. Subject to the Engineer's approval, other types of steel may be used in place of those called for. The Contractor shall submit, for the approval of the Engineer, design calculations for all substitutions prior to the fabrication of the supports.

Tapered tubular supports shall be fabricated from SAE 1020 sheet. These sheets shall be formed and welded, using only one longitudinal weld, then cold processed to the final shape and to minimum yield strength of 55,000 psi. (380 MPa) Taper of the supports shall be uniform and continuous from the base to the top.

657.2.2.2-Structural Supports: Galvanized structural steel supports shall be standard wide flange shapes fabricated from steel conforming to ASTM A36 or ASTM A572 Grade 50 as specified (Breakaway Supports). These supports shall be galvanized in accordance with ASTM A123.

Each wide-flange section shall be fabricated from one piece of metal. Those supports built up by welding short pieces together will be rejected. The steel base plate shall be welded to the support and shall be designed for anchoring to a concrete footing with galvanized steel bolts or to an embedded post stub for break-away sign supports as shown on the Standard Drawings.

657.2.2.3-Pipe Posts: Pipe shall conform to the requirements of ASTM A 53, TYPE E or S, Grade B. Hydrostatic tests are not required.

The steel base plate shall be welded to the support and shall be designed for anchoring to an embedded post stub or anchor bolts as shown in the Plans.

657.2.2.4-Channel Bar Supports: Steel channel post shall comply with the requirements of ASTM A499, Grade 60 and shall be galvanized in accordance with the requirements of ASTM A123. Steel channel posts shall be supplied to the WVDOT in accordance with MP707.02.13.

657.2.2.5-Support Bases: Bases shall be fabricated from steel plate conforming to ASTM A 36 or from cast steel meeting the requirements of ASTM A 27, Grade 65-35. Only one type base shall be used throughout a project.

657.2.2.6-Friction Caps for Pipe Post: Caps shall be fabricated from a good commercial grade steel of either hot rolled or cold rolled steel sheets. Caps shall have an electrodeposited coating of zinc in accordance with the requirements of B 663, Class 12.

657.2.2.7-Support Caps: Support caps castings shall be cast steel conforming to ASTM A 27, Grade 60-30, or cast aluminum Alloy S5A, ASTM B 26, or Alloy SG70A, ASTM B 26 or ASTM B 108. Caps shall be held in place by stainless steel set screws. Only one type cap shall be used throughout the project.

657.2.2.8-Reinforcing Steel: Reinforcing steel shall conform to the requirements of 602.

657.2.2.9

657.2.2.9-Anchor Bolts: Anchor bolts shall be of sufficient size and strength to fully develop the bending moment of the shaft. **Anchor bolts shall be fabricated from a commercial quality hot-rolled carbon steel bar with a minimum yield strength of 50,000 psi (345 MPa).** Each bolt shall have the threaded end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Nuts shall be hot-dipped galvanized and meet the physical, chemical and dimensional requirements of ASTM A-563, Grade A.

657.2.3-Wood:

657.2.3.1-Posts: Material for wood sign posts shall conform to the requirements of 710. The posts shall meet the structural requirements of the current AASHTO Standard Specifications for Highway Bridges for the grade specified. They shall consist of select structural grade posts, seasoned and treated in accordance with these Specifications and the Standard Drawings. Prior to the preservative treatment, the posts shall be cut as indicated on the drawings. Preservatives for treatment shall conform to the requirements of 710.

657.2.4-Concrete: Concrete for sign foundations shall be Class B in accordance with 601.

CONSTRUCTION METHODS

657.3-FABRICATION:

657.3.1-General: Fabrication of all parts of supports shall be in accordance with dimensions shown on the Plans and Standard Drawings. Work shall be done in a uniform workmanlike manner.

657.3.2-Shop Drawings: If supports vary from the Standard Drawings, the Contractor shall submit for the Engineer's approval complete detail drawings, eight copies, showing all structural steel, structural aluminum, aluminum castings, light fixtures and supports, sign brackets and any miscellaneous accessories.

657.3.3-Packaging: All aluminum supports shall be protected by tire wrapping during shipment and storage. The wrapping shall be adequate to prevent damage to the support. Supports delivered for use on a project shall be stored off the ground and under cover in a manner meeting the approval of the Engineer.

657.4-ERECTION:

657.4.1-General: All signs and delineators shall be supported at the points designated on the Plans or by the Engineer in accordance with these specifications and approved shop drawings and shall be erected in reasonably

close conformity to the locations, elevations, and angles shown on the Plans or established by the Engineer.

The Contractor shall take full responsibility for checking all cross sections at approved sign locations to determine final support lengths.

Before starting the excavation for footings, the Contractor shall establish the location of each sign in accordance with the Plans or as directed by the Engineer, and shall mark each site with construction stakes. The Contractor shall furnish stakes, paint, other materials, and labor for performing the locating and staking as described. When the sites have been staked and are ready for inspection, the Contractor shall inform the Engineer, who will check and approve the site or make necessary changes. Centerline station information will be furnished to the Contractor by the Engineer.

Galvanized coating damaged for any reason shall be repaired by the application of a zinc-rich paint conforming to Military Specification MIL-21035 or Federal Specification TIP-461 or as directed by the Engineer.

657.4.2-Setting Posts: All sign posts shall be set vertically so that the sign will be level and at the proper angle with the roadway as shown on the Plans. Posts with bolt-down plates shall be securely bolted to the cast-in-place concrete footings. Leveling shall be accomplished by the use of two nuts and washers on each anchor bolt. One nut with washer shall be turned on each anchor bolt to its approximate position. After setting, the post top nuts and washer shall then be turned into place loosely and the post adjusted to the vertical position by adjusting both upper and lower nuts. The upper nuts shall then be snugly tightened. After leveling the posts, the space between the base plate and the concrete footing shall be filled with grout consisting of one part cement to 1-½ parts of sand, with the addition of an approved admixture to produce high strength and minimum shrinkage grout, or other nonshrink grout approved by the Engineer. Exposed edges of the grout shall be finished to present a neat appearance.

Channel posts shall be driven either by hand or by mechanical devices to the required line and grade, and they shall be plumb above the ground. During driving, posts shall be protected by a special driving cap. Any post bent or otherwise damaged so as to be unfit for use in the finished work shall be removed from the site and replaced by the Contractor at their expense.

All channel posts which are to be erected back-to-back shall be bolted together with 5/16 in. (8 mm) steel bolts for the entire length of the post at the following spacing:

- i. From the ground level to the top of the posts, shall be spaced at 18 in. (457 mm) centers.
- ii. From the ground level to the bottom of the posts, bolts shall be spaced at four inch (102 mm) centers.
- iii. All bolts shall be sufficiently tightened.

657.4.3

When posts are to be located in existing concrete such as dividers or islands, the concrete shall be carefully opened by drilling or other suitable methods. The post shall then be placed to the required depth of embedment and backfilled with base course material to a point approximately 2 inches (50 mm) from the top of the opening. The opening shall then be sealed with approximately 2 inches (50 mm) of a liquid, rubberized asphalt compound in accordance with 708.3.

Post mounted delineators shall be supported by channel bar posts of the material, design, and dimensions specified, driven in earth or inserted in concrete dividers or island. Posts shall be driven plumb in undisturbed earth to a minimum of 24 in. (600 mm) and with the top 4 feet (1.2 m) above the near pavement edge, as shown on the Standard Drawings, and faced toward approaching traffic.

Posts shall be spaced laterally 2 feet (600 mm) beyond the shoulder; in curbed sections 2 feet (600 mm) behind the face of curb; in areas protected by guardrail, in the line of guardrail posts; and in the center of dividers less than 8 feet (2.4 m) in width or as shown on the Standard Drawings.

657.4.3-Structural Excavation: The Contractor shall do all excavation for each sign installation to the levels and dimensions shown on the Plans or as directed by the Engineer to obtain a suitable foundation. Excavation may be accomplished manually or by mechanical means. The Contractor is advised that the grading specifications permit the construction of embankment of rock fill to at least 12 in. (300 mm) below the bottom of subbase.

If rock or a boulder is encountered in excavation, it shall be removed to a depth sufficient, in the opinion of the Engineer, to obtain the stability which would have been obtained had the excavation been made in earth to the depth required by the Plans.

The Contractor shall remove all excavated material from the site that is not needed to backfill and level the disturbed area and restore the site to its original condition.

The Standard Drawings are compiled on the basis of average soil conditions. When, in the opinion of the Engineer, soil conditions will permit lesser foundations or require larger foundations, the Contractor shall propose to the Engineer for written approval the necessary revisions to either post or foundations, or both. Any work in such cases shall be performed without change in the unit bid price.

If the soil tends to cave in, forms shall be used to support the sides of the excavation. The forms shall be placed in such a manner as not to disturb the adjacent soil. If the Contractor elects to remove the form, the removal shall be done immediately after the concrete is poured so that the flowing concrete may fill the space occupied by the form. Otherwise, the form shall become a permanent part of the installation. In the latter case the top portion of the form shall be removed to a minimum of 6 inches (150 mm) below the ground.

The Engineer will determine when forms are necessary. This form work shall be performed at the expense of the Contractor and no compensation will

be allowed therefor.

657.4.4-Footings: Concrete footings are required for all sign supports, except for those specified to be driven. Footings for each sign will vary according to the size of the sign. The Contractor shall construct footings based on the size of the sign and in accordance with these Specifications and the Standard Drawings and Plans, unless otherwise directed by the Engineer. Both circle data as supplied by the manufacturer of the supports shall be followed by the Contractor. All concrete footings shall be flush with the uphill side of the ground line as shown on the Plans or approved drawings. The tops of foundations for embedded posts shall be flush with the ground and sloped to assure proper water drainage away from the posts. When forms for encasement above ground are used, they shall not be removed for at least 18 hours after the concrete is poured.

The concrete footing shall not be loaded by mounting sign support on the anchor bolts until the concrete has cured in accordance with 601 for a period of seven days.

All concrete pedestals shall be given an ordinary finish.

657.4.5-Backfilling: All excavations shall be backfilled with suitable random material in horizontal layers not to exceed 4 inches (100 mm) after compaction. Each lift shall be compacted to the satisfaction of the Engineer. Testing is not required. All surplus material shall be removed from the right-of-way and the backfill finished flush with surrounding natural ground, including replacement of any damaged facilities or appurtenances. The Contractor shall restore all areas disturbed by this excavation or other operations to their original conditions including grading, seeding, mulching and fertilizing as directed by the Engineer.

No separate payment will be made for backfilling materials.

657.4.6-Field Painting of Posts: All aluminum and steel supports shall be painted as specified below. No painting shall begin until the concrete foundations are firmly set.

657.4.6.1-Channel Posts: The 4 inches (100 mm) of a channel post above the concrete foundation shall receive sufficient coats of an asphaltic paint, conforming to the requirements of 705.7, to provide a film of paint approximately 1/8-in. (3 mm) thick. Three coats shall be lapped onto the concrete foundations to provide seal between the post and concrete. Care shall be taken to cover no more of the footing than necessary to provide a proper seal.

657.4.6.2-Aluminum: Protection of aluminum is required where aluminum members are to be attached to steel members or concrete masonry. To avoid the possibility of galvanic corrosion, aluminum members attached to steel shall be coated at the points of contact with a zinc chromate primer. The surface of

657.5

non-galvanized steel members shall be coated at the points of contact with suitable paint, followed by a coat of aluminum paint. Where aluminum surfaces are to be in contact with concrete or masonry, they shall first be given a heavy coat of an alkali-resistant bituminous paint.

657.5-METHOD OF MEASUREMENT:

657.5.1-Class B Concrete Footing, Plain: The quantity of work done for Class B Concrete Footing, Plain will be measured in cubic yards (meters), complete in place and accepted, as determined by the dimensions on the Plans or Contract documents and will be the number of cubic yards (meters) established in the Proposal, subject to adjustment as provided for in 104.2 and 109.2.

Payment will be made at the contract unit price per cubic yard (meter) for "Class B Concrete Footing Plain". Such price will be full compensation for furnishing all labor, materials, and equipment necessary to construct all footings, including staking out footings and stakes for this purpose; excavation for footings regardless of the type of material encountered; constructing and removing forms when required; furnishing, placing, finishing, and curing the concrete; and all other incidentals necessary to complete the work.

657.5.2-Class B Concrete Footing, Reinforced, Roadside: The quantity of work done for Class B Concrete Footing, Reinforced, Roadside will be measured in cubic yards (meters), complete in place and accepted, as determined by the dimensions on the Plans or Contract documents and will be the number of cubic yards (meters) established in the Proposal, subject to adjustment as provided for in 104.2 and 109.2.

Payment will be made at the concrete unit price per cubic yard (meter) for "Class B Concrete Footing, Reinforced, Roadside". Such price will be full compensation for furnishing all labor, materials, and equipment necessary to construct all footings, including staking out footings and stakes for this purpose; excavation for footings regardless of the type of material encountered; constructing and removing forms; furnishing and installing reinforcing steel, anchor bolts, washers and nuts; furnishing and installing electrical grounding and conduit sleeves when required; furnishing, placing, finishing, and curing the concrete; furnishing and placing grout as required by the Plans; and all other incidentals necessary to complete the work.

657.5.3-Wood Supports: Measurements for payment for "Wood Supports" will be based on the linear feet (meters) of wood supports for each size necessary to complete the work. The quantity to be paid for shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines the Plan quantity is in error. In such cases the Plan quantity shall be recomputed to the nearest foot (0.25 meter).

Payment will be made at the contract unit price per linear foot (meter) of support and shall be full compensation for furnishing and erecting the supports, furnishing and installing the galvanized steel sleeve inserts in footings if

required on the Plans, furnishing and installing aluminum angles, and all other materials, equipment, tools, and labor necessary to complete the work.

657.5.4-Channel Posts: Measurement for payment of "Channel Posts" will be based on the linear feet (meters) of steel channel post of each size necessary to complete the work. The length shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines that the Plan quantity is in error. In such case the Plan quantity shall be recomputed to the nearest foot (meter).

Payment will be made at the contract unit price per linear foot (meter) for each size of post required by the Plans. For back to back installation the price per linear foot (meter) shall include all necessary hardware. Such price and payment shall be full compensation for furnishing and erecting the posts, and all labor, equipment, tools, materials, and incidentals necessary to complete the work.

657.5.5-A 36 Supports: Measurement for payment of "A 36 Supports", a specified for A 36 steel in 657.2.2.2, will be based on the number of linear feet (meters) of supports for each size necessary to complete the work. The quantity to be paid for shall include the supports and base plates. The length shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines that the Plan quantities are in error, in which cases the Plan quantities will be recomputed. Lengths will be computed to the nearest ½ ft. (150 mm) for each installation and the nearest 1 ft. (300 mm) for the total length. This item does not include brackets or clamps for attaching the sign to the supports.

Payments will be made at the contract unit price per linear foot (meter) of supports for each size and shall be full compensation for furnishing and erecting all supports and materials, tools, labor, and equipment necessary to complete the work.

657.5.6-Structural Supports, Aluminum: Measurement for payment of "Structural Supports, Aluminum" for Alloy 6061-T6 as specified in 657.2.1.2 will be based on the number of linear feet (meters) of supports for each size necessary to complete the work. The quantity to be paid for shall include the supports and base plates. The length shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines that the Plan quantities are in error, in which cases the Plan quantities will be recomputed. Lengths will be computed to the nearest ½ ft. (150 mm) for each installation and the nearest 1 ft. (300 mm) for the total length. This item does not include brackets or clamps for attaching the sign to the supports.

Payment will be made at the contract unit price per linear foot (meter) of support for each size and shall be full compensation for furnishing and erecting all supports and materials, tools, labor, and equipment necessary to complete the work.

657.5.7-Tubular Supports: Measurement for payment of "Tubular Supports" will be based on the number of linear feet (meters) of supports for each size necessary to complete the work. This material shall be either steel or aluminum, as required by the Plans. The quantity to be paid for shall include the supports, base plates, and pole caps. The length shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines that the Plan quantities are in error, in which cases the Plan quantities will be recomputed. Lengths will be computed to the nearest ½ ft.(150 mm) for each installation and the nearest 1 ft. (300 mm) for the total length. This item does not include brackets or clamps for attaching the sign to the supports.

Payments will be made at the contract unit price per linear foot (meter) of supports for each size and shall be full compensation for furnishing and erecting all supports and materials, tools, supplies, labor, and equipment necessary to complete the work.

657.5.8 - A572 Supports, Galvanized: Measurement for payment of "A572 Supports, Galvanized" as specified for A572 Grade 50 steel in 657.2.2.2 will be based on the number of linear feet (meter) of supports for each size necessary to complete the work. The quantity to be paid for shall include the supports and all special items included in the break-away support design configuration. The length shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines that the Plan quantities are in error, in which cases the Plan quantities will be recomputed. Lengths will be computed to the nearest ½ ft.(150 mm) for each installation and the nearest 1 ft. (300 mm) for the total length. This item does not include brackets or clamps for attaching the sign to the supports.

Payment will be made at the contract unit price per linear foot (meter) of support for each size and shall be full compensation for furnishing and erecting all supports and materials, tools, labor, and equipment necessary to complete the work.

657.5.9-A572 Supports, Painted: Measurement for payment of "A572 Supports, Painted" as specified for A572 Grade 50 steel in 657.2.2.2 will be based on the number of linear feet (meter) of supports for each size necessary to complete the work. The quantity to be paid for shall include the supports, all special items included in the break-away support design configuration, and painting of these supports. The length shall be the Plan quantity unless the Engineer orders changes in the lengths of posts or determines that the Plan quantities are in error, in which cases the Plan quantities will be recomputed. Lengths will be computed to the nearest ½ ft. (150 mm) for each installation and the nearest 1 ft. (300 mm) for the total length. This item does not include brackets or clamps for attaching the sign to the supports.

Payment will be made at the contract unit price per linear foot (meter) of support for each size and shall be full compensation for furnishing and erecting all supports and materials, tools, labor, and equipment necessary to complete

the work.

657.5.10-Pipe Posts: Measurement for payment of "Pipe Posts" will be based on the actual number of pipe posts of each type necessary to complete the work. This quantity shall be the Plan quantity unless the Engineer determines the Plan quantity to be in error and changes the quantity of pipe posts per type.

Payment will be made at the contract unit price per type of pipe post and shall be full compensation for furnishing and erecting all posts and materials, tools, labor, and equipment necessary to complete the work.

657.5.11-Post Removal: Measurement for payment of "Post Removal" will be based on the actual number of posts that are designated on the Plans and are necessary to complete the work. This quantity shall be the Plan quantity unless the Engineer determines the Plan quantity to be in error and changes the quantity of posts to be removed.

Payment will be made at the contract unit price per post. This price shall also be full compensation for the removal and disposal of the signs and sign assemblies, including hardware and bracing, the removal and disposal of the post supports and the restoration of the ground surface to its original condition.

657.6-BASIS OF PAYMENT:

The quantities, determined as provided, will be paid for at the contract unit price for the items listed below, which prices and payment shall be full compensation for furnishing all the material and doing all the work prescribed in a workmanlike and acceptable manner, including all tools, equipment, supplies and incidentals necessary to complete the work. All incidental work and materials for which no basis of payment is provided will be considered as completely covered by the prices bid for the items included in the Contract.

SECTION 658

OVERHEAD SIGN STRUCTURES

658.1-DESCRIPTION:

This item shall consist of the fabrication and erection of overhead bridge, cantilever, and butterfly sign supports and fastening accessories in accordance with the requirements of the Plans and of these Specifications. All details not specified or not shown on the Plans shall conform to the details and requirements set forth in the following Specifications and publications:

The Manual on Uniform Traffic Control Devices for Streets and Highways, latest issue, including revisions, as printed by the Federal Highway Administration, U.S. Department of Transportation. (Referred to as the MUTCD).

Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals, latest issue, including revisions, American Association of State Highway and Transportation Officials.

658.2-MATERIALS:

Materials furnished by the Contractor shall be of new stock conforming to the requirements of the Standard Specifications, and shall meet with the approval of the Engineer.

All materials shall conform to the requirements of Division 700 of the Standard Specifications and shall also conform to the following requirements unless otherwise modified on the Plans. All referenced specifications for materials shall be the latest available specifications and revisions at the time of award of the contract.

658.2.1-Aluminum: Tubular aluminum supports of a uniform diameter

658.2.2.1

shall be fabricated from Alloy 6061-T6 or Alloy 6063-T6, ASTM B221, B429, or B 241 for extruded sections or ASTM B 209 for sheet sections.

Structural shapes and bars shall be Alloy 6061-T6, ASTM B 221, or B 308. Plates shall be Alloy 6061-T6, ASTM B209.

Castings for support top caps and horizontal member end caps shall be ASTM B 26 Alloy 356-F or Alloy 43, and shall be held in place by stainless steel set screws. The same type cap must be used throughout a project.

Aluminum hardware shall meet the requirements of 661.2.1.3. Steel nuts, bolts and washers used on aluminum structures shall be stainless.

Welding wire shall be in accordance with 658.4.

658.2.2-Steel:

658.2.2.1-Galvanized Steel: All steel items shall be galvanized in accordance with ASTM A 123 or ASTM A 153, unless otherwise specified.

Vertical poles, transverse horizontal beams and horizontal arms shall be tapered tubular sections or tubular sections of uniform diameter and shall have a minimum yield strength of 55,000 psi (380 MPa) after fabrication. All tubular sections shall have only one longitudinal weld. Any taper shall be uniform and continuous. Other tubular structural members shall be uniform in diameter and shall be fabricated from seamless or welded pipe conforming to ASTM A 501 or ASTM A 53, Type E or S, Grade B (hydrostatic tests are waived).

Tubular sections of a uniform diameter shall be fabricated from seamless and welded pipe conforming to ASTM A 501 or ASTM A 53, Type E or S, Grade B (hydrostatic tests not required).

Steel for other structural members, plates and structural shapes shall conform to ASTM A 36, except plates over 1 in. (25 mm) thick shall conform to ASTM A 572, Grade 42.

Support top and horizontal end cap castings shall be ASTM B 26 Alloy S5A or Alloy 356-F. Caps will be held in place by stainless steel set screws. The same type cap shall be used throughout the project.

Stainless steel bolts, nuts and washers for splicing flanges shall be AISI 300 series, commercial grade and passivated. High strength bolts and nuts for splicing flanges shall conform to ASTM A 325 or ASTM A 193-B7.

Reinforcing materials shall be in conformance with 709.1 to 709.4, inclusive, except that welded wire fabric may be furnished in rolls.

Anchor bolts shall be of sufficient size and strength to fully develop the bending moment of the shaft. **Anchor bolts (unless otherwise directed on the Plans) shall be fabricated from high strength steel, meeting ASTM A1554, Gr. 105.** Each bolt shall have the threaded end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Each bolt shall be provided with two heavy hex nuts and two heavy washers. Both nuts and washers shall be hot-dipped galvanized in accordance with ASTM A 153 and the nuts shall meet the physical, chemical and dimensional requirements of

658.2.2.2

ASTM A 563, Grade DH or ASTM A 194-2H.

Detailed properties, dimensions, bolt circles and appropriate backup calculations for any proposed alternate design anchor bolts shall be submitted to and approved by the Division before fabrication.

658.2.2.2-Weathering Steel: All components of the overhead sign supports including miscellaneous fixtures, shall be fabricated from plates, bars, standard W, M, and S shapes produced from steel conforming to ASTM A 588 and supplementary of AASHTO M 222, and tubes produced from steel conforming to ASTM A 618, Grade 1, and supplementary Table S1 of AASHTO M 222.

Expanded metal screen shall be fabricated from steel sheets conforming to ASTM A 606, Type 4, with special alloys to provide weathering properties equivalent to ASTM A 588 or ASTM A 618 steel. Framing plates for expanded metal screen shall be fabricated from steel conforming to ASTM A 588 or ASTM A 242.

Bolts, nuts and washers for field splices and connections shall conform to ASTM A 325, Type 3. When allowed by the Engineer, they shall conform to ASTM A 325, Type 1 or 2, with hot-dipped galvanizing in accordance with ASTM A 153. Etching and painting shall be performed to match 595 standard color 20062.

The truss of post connections for box truss overhead supports shall be cast steel conforming to ASTM A 486, Class 90. Pins shall conform to ASTM A 108, Grade 1118. Pin holes in the casting shall be reamed to true size.

Reinforcing materials shall be in conformance with 709.1 to 709.4, inclusive, except that welded wire fabric may be furnished in rolls.

Anchor bolts shall be of sufficient size and strength to fully develop the bending moment of the shaft. Anchor bolts shall be fabricated from high strength steel having a minimum yield strength of ASTM A1554, Gr. 105 Each bolt shall be provided with two heavy hex nuts. Both nuts shall be hot-dipped galvanized and, as a minimum, meet the physical, chemical and dimensional requirements of ASTM A 307. Washers shall be of standard commercial grade steel having the dimensions shown on the Detail Drawings and be hot-dipped galvanized in accordance with ASTM A 153.

Filler metal for welds shall conform to the requirements of 615.5.7.

658.2.3-Concrete: Concrete for sign foundations shall be Class B in accordance with 601.

658.2.4-Reinforcing Steel Bars: Reinforcing steel bars shall conform to the applicable requirements of 602.

CONSTRUCTION METHODS

658.3-FABRICATION:

658.3.1-General: Before fabrication of any sign structure, the Contractor shall submit for the Engineer's approval complete detail drawings, eight copies, of each structure. This shall include drawings of all structural steel or aluminum framing and bracing, aluminum or steel castings, lighting fixtures and supporting brackets, sign brackets and any miscellaneous accessories for the above. It is expressly understood that the review by the Engineer of these drawings relates to the requirements for strength and general details, and will not relieve the Contractor from responsibility for errors in detail, dimension, or quantity of materials, etc.

Overhead sign supports shall be fabricated in accordance with the Plans and this Specification. Any alternate design or significant departure from the Plans proposed by the Contractor must be presented in written or plan form for approval. The Division will approve or disapprove alternate proposals in writing. All materials in any alternate proposal which is a significant departure from the Specifications shall conform to the requirements of current AASHTO and ASTM Specifications. The Division will not approve substitution of material or design detail changes which constitute a reduction in quality, workmanship or strength of the structures.

Ends of sections shall be cut true and smooth, free from burrs and ragged breaks. Open ends of tubular sections shall be capped as shown on the Plans. Drain holes and handholes shall be provided wherever shown or necessary.

Sign supports, either aluminum or steel, shall be void of circumferential welding except at the base, flanges, or intersection of diagonals.

The welding of steel shall be in accordance with the requirements of American Welding Society D1.1 and shall be done by qualified welders. Aluminum Alloy Welding shall be accomplished in accordance with 658.4.

The loading, transporting, unloading, and piling of structural materials shall be conducted so that the metal will be kept clean and free from injury in handling. Structural materials shall be stored above the ground upon platforms, skids, blocks, or other supports. They shall be kept free from accumulation of dirt, oil, acids, or other foreign matter. Any structural material which has been deformed shall be straightened by approval methods before being laid out, punched, drilled, or otherwise worked upon in the shop. Sharp kinks or bends will be cause for rejection.

Where required or indicated on the Plans, a sufficient number of reinforced handholes and electrical wire inlets and outlet fittings shall be built into the structures. Where a cable passes through a hole or runs along a surface at any point through or on the complete assembly, such holes and surfaces shall be deburred and void of any sharp edges through or along the surface. A "J" hook shall be provided on the inside of the top of the vertical support on which the electrical wiring shall be placed as shown on the Detail Drawings.

658.3.2-Structures Utilizing Galvanized Steel: The flanges at the center

658.3.3

of the cross beam and at the ends of the horizontal arms shall be fastened to the tapered or straight sections by means of two circumferential welds. One of the circumferential welds shall firmly weld the outside of the flange to the tube. Any alternate flange connection offered shall be designed to develop fully the strength of the tubular sections being jointed together by means of the flange connection.

It is essential that all exposed surfaces of the completed steel structure by finished with a galvanized coating. The frame shall be fabricated into sections as large as can be handled in pickling and galvanizing tanks and then dipped as complete units, ready for field bolted connections wherever possible. Field welding and the need for repairing zinc coatings damaged by assembly shall be kept to an absolute minimum.

Galvanized coatings damaged for any reason shall be repaired by the application of a zinc rich paint conforming to the requirements of 711.21.

The places to be painted shall be thoroughly cleaned before the paint is applied.

658.3.3-Structures Utilizing Weathering Steel: Overhead sign structures of weathering steel are to have a natural weathering finish and shall be kept clear of all paint, grease, or other agents which will tend to cause an uneven finish on the posts. Any identification marks shall be painted on the bottom of the base plates, inside faces of loose column components and the top surface of horizontal members. All structures shall be delivered to the job site at least three months prior to completion of the work and stored in a manner that will allow them to obtain initial natural weathering. If they are stacked on the job site during this period, they shall be rotated at least once each two months. All members shall be shop cleaned in accordance with 615.6.4, utilizing commercial blast cleaning throughout. No corrosion inhibitors shall be used in the processes.

All welding shall conform to the requirements of AWS D1.1.

658.4-WELDING OF ALUMINUM ALLOYS:

These specifications apply to the welding of aluminum alloys used in sign structures, bridge rails, lamp posts, etc.

The welding terms used in these specifications shall be interpreted in accordance with the definitions given in the latest edition of AWS Definitions--Welding and Cutting (AWS A3.0) of the American Welding Society.

The welding symbols used on plans shall be those shown in the latest edition of Standard Welding Symbols (AWS A2.0) of the American Welding Society. Special conditions shall be fully explained by added notes or details.

658.4.1-Base Metals: The aluminum alloys to be welded under these specifications may be any of the following alloy designations (ASTM designations):

- i. Wrought non-heat-treatable alloys

- Alloy 3003
- Alloy 3004
- Alloy 5052
- Alloy 5083
- Alloy 5086
- Alloy 5456
- ii. Wrought heat-treatable alloys
 - Alloy 6061
 - Alloy 6063
- iii. Cast heat-treatable alloys
 - Alloy 356.1
 - Alloy A356.2

658.4.1.1-Materials used for permanent backing shall be at least equivalent in weldability to the base metal being welded.

658.4.2-Welding Processes: These Specifications include provisions for welding by the gas metal-arc process and the gas tungsten-arc process. Other processes shall not be used except as permitted by the Engineer.

658.4.3-Filler Metal: Bare wire electrodes for use with gasmetal-arc process and welding rods for use with the gas tungsten-arc process shall conform to the requirements of the latest edition of Specifications for aluminum and aluminum alloy rods and bare electrodes AWS A5.10.

Tungsten electrodes for the gas tungsten-arc process shall conform to the requirements of the latest edition of Specifications for Tungsten-Arc-Welding Electrodes, AWS A5.12.

Filler metals to be used with particular base metals shall be as shown in Table 658.4.3. Other filler metals may be used as approved by the Engineer.

658.4.3

TABLE 658.4.3	
Base Metal	Filler Material
3003 to 3003	ER1100
3004 to 3004	ER4043
5052 to 5052	ER5356*
5083 to 5083	ER5183
5086 to 5086	ER5356*
5456 to 5456	ER5556
5670B to 6061	ER4043*
5670B to 6063	ER4043*
356.1 to 6061	ER4043
A356.2 to 6063	ER4043
6061 to 6063	ER4043 or ER5356
6061 to 6061	ER4043 or ER 5356
6063 to 6063	ER 4043 or ER5356

Filler metals shall be kept covered and stored in a dry place at relatively uniform temperatures. Original rod or wire containers shall not be opened until time to be used. Rod and wire shall be free of moisture, lubricant, or other contaminants. Spools of wire temporarily left unused on the welding machine shall be kept covered to avoid contamination by dirt and grease collecting on the wire. If a spool of wire is to be unused for more than a short length of time, it shall be returned to the carton and the carton tightly resealed.

658.4.4-Shielding Gases: Shielding gases shall be welding grade or better.

Shielding gas for gas metal-arc welding shall be argon, helium, or a mixture of the two (approximately 75 percent helium and 25 percent argon).

Shielding gas for gas tungsten-arc welding done with alternating current shall be argon.

Shielding gas for gas tungsten-arc welding done with direct current, straight-polarity, shall be helium.

Hose used for shielding gases shall be made of synthetic rubber or plastic. Natural rubber hose shall not be used. Hose which has been previously used for acetylene or other gases shall not be used.

658.4.5-Preparation of Materials: Joint details shall be in accordance

with design requirements and detail drawings. The locations of joints shall not be changed without the approval of the Engineer.

Edge preparation shall be by sawing, machining, clipping, or shearing. Gas tungsten-arc or gas metal-arc cutting may also be used. Cut surfaces shall meet the American Standards Association surface roughness rating value of 1,000. Oxygen cutting shall not be used.

Surfaces and edges to be welded shall be free from fins, tears, and other defects which would adversely affect the quality of the weld.

Dirt, grease, forming or machining lubricants or any organic materials shall be removed from the areas to be welded by cleaning with a suitable solvent or by vapor degreasing.

On all edges and surfaces to be welded, the oxide shall be removed just prior to welding by wire brushing or by other mechanical methods such as rubbing with steelwool or abrasive cloth, scraping, filing, rotary planing, or sanding. If wire brushing is used, the brushes shall be made of stainless steel. Hand or power driven wire brushes which have been used on other materials shall not be used on aluminum.

Where mechanical methods of oxide removal are found to be inadequate, a standard chemical method shall be used. Welding shall be done within 24 hours after chemical treatment.

When gas tungsten-arc welding with direct current, straight polarity is being used, all edges and surfaces to be welded shall have the oxide removed by a standard chemical method.

Welding shall not be done on anodically treated aluminum, unless the condition is removed from the joint area to be welded.

658.4.6-Welding Procedure: All butt welds requiring 100 percent penetration, except those produced with the aid of backing, shall have the root of the initial weld chipped or machined out to sound metal before welding is started from the second side. Butt welds made with the use of backing shall have weld metal thoroughly fused with the backing. Where accessible, backing for welds that are subject to computed stress or which are exposed to view on the completed structure and which are not otherwise parts of the structure, shall be removed and the joints ground or machined smooth. In tubular members, butt welds subjected to computed stresses shall be made with the aid of permanent backing rings or strips.

The procedure used for production welding of any particular joint shall be the same as used in the procedure qualification for that joint.

All welding operations, either shop or field, shall be protected from air currents or drafts so as to prevent any loss of gas shielding during welding. Adequate gas shielding shall be provided to protect the molten metal during solidification.

The work shall be positioned for flat position welding whenever practicable.

In both shop and field, all weld joints shall be dry at the time of welding.

658.4.7

The size of the electrode, voltage and amperage, welding speed, gas or gas mixture, and gas flow rate shall be suitable for the thickness of material, design of joint, welding position and other circumstances attending the work.

Gas metal-arc welding shall be done with direct current, reverse polarity.

Gas tungsten-arc welding shall be done with alternating current or with direct current straight polarity.

When the joint to be welded requires specific root penetration, the Contractor shall make a sample joint and a macroetched cross section of the weld to demonstrate that the joint welding procedure to be used will attain the required root penetration. The sample joint shall have a length of at least 1 ft. (300 mm) and shall be welded with the electrode, polarity, amperage, voltage, speed, gas mixture and gas flow rate that are proposed to be used in production welding. The Engineer, at their discretion, may accept evidence on record in lieu of the preceding test.

Where preheat is needed, the temperature of preheat shall not exceed 350° F (175 ° C) for heat-treated alloys or 600° F (315° C) for non-heat-treated alloys. The temperature shall be measured by temperature indicating crayons or by pyrometric equipment. Heat treated alloys shall not be held at the maximum preheat temperature or at temperatures near the maximum for more than 30 minutes.

658.4.7-Weld Quality: Regardless of the method of inspection, the acceptance or rejection of welds shall be determined by the following conditions:

- i. Cracks in welds or adjacent base metal will not be acceptable.
- ii. Copper inclusions will not be acceptable.
- iii. Porosity in excess of that permitted by Appendix IV, Section VII of the ASME Boiler and Pressure Vessel Code will not be acceptable.
- iv. Lack of fusion, incomplete penetration, or tungsten or oxide inclusions will be acceptable only if small and well dispersed.

Undercut shall not be more than 0.01 in. (250 µm) deep when its direction is transverse to the primary stress in the part that is undercut.

Undercut shall not be more than 1/32 in. (800 µm) deep when its direction is parallel to the primary stress in the part that is undercut.

No overlap shall be allowed.

All craters shall be filled to the full cross section of the welds.

Welds having defects greater than the levels of acceptance specified above shall be considered as rejected unless corrected in accordance with 658.4.9.

658.4.8-Inspection: To determine compliance with 658.4.7, all welds shall be visually inspected and, in addition, all welds subjected to computed stress shall be inspected by the dye penetrant method except as specified in 658.4.8.3.

658.4.8.1-For highway sign structures, the dye penetrant method shall be

used on butt welds in columns and main chord members, and on fillet welds connecting columns to bases and main chord members, including the associated flanges, gussets, or main load carrying brackets or members; also, on fillet welds connecting flanges to the main truss chord members.

658.4.8.2-The dye penetrant tests shall be performed in accordance with the requirements of ASTM E 165, Method B, Procedures B-2 or B-3.

658.4.8.3-Dye penetrant inspection may be omitted provided that the inspector examines each layer of weld metal with a magnifier of 3X minimum before the next successive layer is deposited.

658.4.9-Corrections: In lieu of rejection of an entire piece or member containing welding which is unacceptable, the corrective measures listed below may be permitted by the Engineer, whose approval shall be obtained prior to making each repair.

658.4.9.1-Defective welds shall be corrected by removing and replacing the entire weld, or as follows:

- i. Cracks in welds or base metal: Determine full extent of crack by dye penetrant method or other positive means. Remove crack throughout its length and depth, and reweld.
- ii. Excessive porosity, lack of fusion: Remove defective portions and reweld.
- iii. Copper or tungsten inclusions: remove defective portions and reweld.
- iv. Excessive concavity of crater, undercut, undersize weld Clean and deposit additional weld metal.
- v. Overlap: Reduce by removal of excess weld metal.

658.4.9.2-The defective areas shall be removed by chipping or machining. Oxygen cutting shall not be used. Before rewelding, the joint shall be inspected to assure that all the defective weld has been removed. If dye penetrant has been used to inspect the weld, all traces of penetrant solutions shall be removed with solvent, water, heat, or other suitable means before rewelding.

658.4.10-Qualification of Procedures, Welders and Welding Operators: Joint welding procedures which are to be employed in executing contract work under these specifications shall be previously qualified by tests prescribed in Part B, Section IX, of the ASME Boiler and Pressure Vessel Code. The qualifications shall be at the expense of the Contractor. The Engineer, at their discretion, may accept evidence of previous qualification of the joint welding procedures to be employed.

All welders and welding operators to be employed under these specifications shall be previously qualified by tests as prescribed in Part B,

658.5

Section IX, of the ASME Boiler and Pressure Vessel Code. The Engineer, at their discretion, may accept evidence of previous qualification of the welders and welding operators to be employed. The same process and type of equipment that is required for execution of the construction work shall be used in qualifying welders and welding operators.

658.5-ERECTION:

Erections of sign structures shall be in accordance with the applicable provisions of the current edition of the Standard Specifications and the requirements given below. The Contractor shall provide all tools, equipment and appliances necessary for the expeditious handling of the work, all of which shall be subject to the approval of the Engineer. Materials and workmanship not previously inspected will be inspected on the site of the work and all rejected material shall be removed from the site of the work.

In order to reduce the hazards of performing work over roadways and to provide sign loads to sign bridges immediately, the sections of a horizontal strut of any bridge shall be spliced together for the full length of one span and all sign panels, lighting and other accessories required thereon, as described elsewhere in these Specifications, shall be fully installed before erecting the complete assembly between the previously erected columns or as directed by the Engineer. The fully assembled structure shall be handled and erected in such a manner as not to damage any of the installations thereon.

Overhead sign supports shall provide a vertical clearance, between the bottom edge of the sign or luminaire support for the full width of the pavement and shoulders of not less than 17 feet (5.2 m).

The Contractor shall take full responsibility for checking all cross sections at approved sign locations to determine final sign structure dimensions.

Where cylindrical concrete footings are used, the concrete shall be placed against undisturbed earth. Earth augers, if used shall be of the same diameter as the footings. Where a trench is required, it shall be only as wide and long as is necessary to accommodate the work. The excavation shall be made in accordance with the applicable provisions of the Standard Specifications. All excavations shall be backfilled with suitable random material in horizontal layers not to exceed 4 inches (100 mm) after compaction. Each lift shall be compacted to the satisfaction of the Engineer. Testing is not required. All surplus material shall be removed from the right-of-way and the backfill finished flush with surrounding natural ground, including replacement of any damaged facilities or appurtenances. The Contractor shall restore all areas disturbed by this excavation or other operations to their original conditions including grading, seeding, mulching and fertilizing as directed by the Engineer.

If rock or boulders are encountered during the excavation, they shall be removed to a depth sufficient, in the opinion of the Engineer, to obtain the stability necessary to support the complete sign structure.

The footings shall be of Class B concrete, reinforced, of the types shown on the Plans. Steel reinforcement, anchor bolts and conduit for the footings shall

be as shown on the Plans.

All overhead sign structures shall have ground rods,irregardless of whether they have sign lighting or other electrical components. Ground rods shall be copperclad steel, $\frac{3}{4}$ inches (19 mm) in diameter with a minimum length as noted on the Plans and shall be one piece. Sectional or segmented ground rods are not permitted. The ground rods shall be complete with ground clamp and square head bolt.

The anchor bolts shall be set accurately, by means of a template in the position shown on the drawings and held rigidly in the forms so as to avoid displacement during the pouring of concrete. The steel reinforcement and conduit shall have been properly placed and secured before the pouring of concrete. The Contractor shall make periodic checks of the bolt positions and elevations during concreting operations. It is essential that the distance between the centers of anchor bolt groups of the two or three foundations of a frame be exactly the span lengths shown on the Plans.

Two inch (50 mm) diameter galvanized conduit shall be furnished and installed in the post foundations at locations as specified on the Plans. The conduit shall terminate above the top of the foundation and shall be fitted with a 2 in. (50 mm) capped grounding bushing above the foundation. The lower end of the conduit shall emerge from the side of the footing to be joined to conduit from the junction box.

The entire structure shall be erected and adjusted for plumbness, grades and alignment by the manipulation of the leveling nuts on the anchor bolts.

Electrical materials and other installations need not be in place on the columns at the time of column erection.

Brackets for attaching signs shall be spaced as shown on the Standard Drawings or the Plans. There shall be a minimum of two brackets per sign.

The field assembling of the component parts of a structure shall be done in a manner not likely to produce damage by twisting, bending, or otherwise deforming the metal. Any member slightly bent or twisted shall have all defects corrected in an approved manner before being placed. Members seriously damaged will be rejected. All exposed surfaces shall be free of blemishes and scratches. Painting will not be allowed. Just prior to erection, the aluminum shall be thoroughly cleaned and any accumulations of oil, grease, dirt or foreign materials shall be removed by the use of an approved solvent cleaner.

Protection of aluminum is required where aluminum members are to be attached to concrete masonry or steel which is neither galvanized nor stainless.

To avoid the possibility of corrosion, aluminum members attached to such bare steel shall be coated at the points of contact with a zinc chromate primer or as called for on the Plans. The surfaces of steel members, nongalvanized, shall likewise be coated at the points of contact with a suitable priming paint and this shall be followed by a coat of aluminum paint. Where aluminum surfaces are to be in contact with concrete or masonry, they shall first be given a heavy coat of an alkali-resistant bituminous paint.

658.5.1 - Erection of Columns or Cantilever Uprights:

- I. Place leveling nuts, then washers on anchor bolts at level position.
- II. Insure anchor bolts and the bolt holes in base plate are properly aligned.
 - a. No cold working of bolts will be allowed.
 - b. No cutting or reaming of holes will be allowed without prior approval from the Traffic Engineering Division.
- III. Place column or cantilever upright onto the anchor bolts.
- IV. Hold column or cantilever upright at true plumb.
 - a. Adjust leveling nuts as necessary (column may not always be exactly perpendicular to base plate due to welding distortion, etc.).
- V. All bolts will be coated with either of the following waxes Jon Cote 639 or MacDermid Torque 'N Tension Control Fluid. The top anchor bolt nuts must be installed the same day that the wax is applied to the anchor bolts.
- VI. Place washers, then the top anchor bolt nuts on the anchor bolts.
- VII. Snug the anchor bolt nuts alternating corner-to-corner and side-to-side. Snug tight is defined as the tightness which exists due to the full effort of a man using a spud wrench with the appropriate length handle for the bolt being tightened. The following chart indicates the size of the wrench to be used when snugging bolts:

<u>BOLT DIAMETER</u>	<u>HANDLE LENGTH OF WRENCH</u>
¾ in (19.05 mm)	23" (575 mm)
7/8 in (22.23 mm)	23" (575 mm)
1 in (25.40 mm)	23" (575 mm)
1¼ in (31.75 mm)	23" (575 mm)
1½ in (38.10 mm)	36" (900 mm)
1¾ in (44.45 mm)	36" (900 mm)
2 in (50.80 mm)	36" (900 mm)
2¼ in (57.15 mm)	36" (900 mm)

- VIII. Apply 1/3 turn to each nut in the same sequence as snugging. Mark top anchor bolt nuts, anchor bolts, and base plate for reference to insure proper rotation is achieved. A hydraulic torque wrench meeting the minimum requirements specified

must be used to properly tension the anchor bolt nuts. Breaker bars, cheater bars, air wrenches, or other mechanical devices will not be allowed as they cannot achieve the proper tension.

- IX. Release any load by crane or other erection device. The anchor bolt nuts must be properly tightened before removal of the crane.
- X. Check structure. If problems exist such as the anchor connections are loose, then repeat the nut tightening procedure.

658.5.2 - Connection of Spans:

- I. Lift span, with signs, lighting and other accessories attached, to columns and insure bolts and bolt holes properly aligned.
- II. Insure connecting plates fit with no burrs or other seating inhibitors.
- III. Install bolts, nuts, and washers to snug tight, corner-to-corner and side-to-side. Use the above chart to determine a proper size wrench for snugging bolts. All bolts will be properly waxed before the nuts are installed.
- IV. Apply appropriate rotation to turning element in the same sequence as snugging and for high strength bolts in accordance with Table 615.3.214B of the Standard Specifications.
- V. Check structure. If problems exist, such as loose arm connections or showing gaps, the load must be removed from the area in question and steps repeated as necessary.

658.5.3 - Hydraulic Torque Wrench Specifications:

Anchor bolt nuts may only be tightened by a hydraulic wrench with a Minimum Capacity of 5300 ft. lbs. (7,180 Newton Meter), and must be capable of tightening or loosening.

658.5.4 - Verification of Contractor's Equipment and Personnel:

The Contractor will contact the Materials Control, Soils and Testing (MCS&T) Section ten working days prior to erection of the first sign structure. MCS&T personnel will meet with the inspector and contractor to verify installation procedures.

658.6-METHOD OF MEASUREMENT:

658.6.1-Class B Concrete Footing, Reinforced, Overhead: The quantity of work done for Class B Concrete Footings, Reinforced, Overhead will be measured in cubic yards (meters), complete in place and accepted, as determined by the dimensions on the Plans or Contract documents and will be the number of cubic yards (meters) established in the Proposal, subject to adjustment as provided for in 104.2 and 109.2.

658.6.2-Overhead Sign Structures: Measurement for payment for overhead sign structures will be based on each unit complete in place, which will include

658.7

the various elements of the structure consisting of vertical end support units, horizontal units, vertical sign brackets, structural framing for signing if required, sign lighting support hardware if required (horizontal brackets, pads, bolts, nuts, plates, etc.) and any other accessories or hardware as required to make a complete installation as called for on the Plans or as directed by the Engineer.

658.7-BASIS OF PAYMENT:

The quantities, determined as provided above, shall be paid for at the contract unit price for the items listed below, which prices and payment shall be full compensation for furnishing all the materials and doing all work prescribed in a workmanlike and acceptable manner, including staking out footings and stakes therefore; excavating for footings regardless of the type of material encountered; constructing and removing forms; furnishing and installing reinforcing steel, anchor bolts, washers and nuts; furnishing and installing electrical grounding and conduit sleeves; furnishing, placing, finishing and curing the concrete; furnishing and placing grout as required by the Plans; fabrication, delivery and erection of each overhead sign; and including all tools, equipment, supplies and incidentals necessary to complete the work. All incidental work and materials for which no basis of payment is provided will be considered as completely covered by the prices bid for the items included in the contract.

658.8-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
658001-*	CLASS B CONCRETE FOOTINGS, REINFORCED, OVERHEAD	CUBIC YARD (METER)
658002-*	OVERHEAD SIGN, STEEL-ALUMINUM COMBINATION	EACH
658003-*	OVERHEAD SIGN, GALVANIZED STEEL	EACH
658004-*	OVERHEAD SIGN, WEATHERING STEEL	EACH

SECTION 659

SIGN LIGHTING

659.1-DESCRIPTION:

Sign lighting shall consist of furnishing and installing or modifying sign illumination systems, including all necessary accessories, in accordance with the Plans and the following Specifications or as directed by the Engineer.

All electrical equipment shall conform to the standards of the National Electrical Manufacturers Association (NEMA), the Underwriters' Laboratories, Inc. (UL), or the Electronic Industries Association (EIA), whichever is applicable. In addition to the requirements of the Plans and these Specifications, all materials and workmanship shall conform to the requirements of the National Electrical Code (NEC), referred to as the Code; the American Society for Testing Materials (ASTM); the American National

Standards Association (ANSI); The American Wire Gauge (AWG), and any local ordinances which may apply.

Wherever reference is made in these Specifications to the Code or to the standards mentioned above, the references shall mean the code or standard, including revisions, that is in effect at the time of the award of the contract.

659.2-MATERIALS:

The materials furnished and used shall be new, except as may be specifically provided on the Plans. The materials shall be manufactured, handled, and used in a workmanlike manner to insure a completed installation in accordance with the Plans and Specifications.

All electrical materials shall conform to the special requirements and to the Standardization Rules of the Institute of Electrical and Electronic Engineers, IPCEA and, when governing, shall also conform to the National Electrical Code, local and special laws or ordinances, and the Underwriter's Laboratories.

659.2.1-Equipment Lists and Drawings: The Contractor shall submit to the Engineer for approval detailed drawings in duplicate of switch box and luminaire equipment and of any proposed deviations from the Plans. Following checking, correction, and approval, not less than eight complete sets shall be submitted to the Engineer. The Division will not be liable for any material purchased, labor performed, or delay to the work prior to such approval.

If ordered by the Engineer, the Contractor shall submit for approval sample articles of the materials proposed for use. Parts list, service instructions, and all apparatus warranties packaged with or accompanying the electrical equipment to be installed on the project shall be delivered to the Engineer.

659.2.2-Conduit: All conductors shall be run in conduit, except for overhead or temporary installations and where conductors are run inside poles. Conduit to be installed underground, on the surface of poles, or in structures, except as shown on the Plans, shall be Type R, Type F, or Type P as follows:

- i. Type R (Rigid Steel Conduit) shall meet the requirements of Section 715.42.10.1.
- ii. Type F (Flexible, Liquid-Tight Conduit) shall meet the requirements of Section 715.42.10.2.
- iii. Type P (Polyvinyl Chloride Conduit) shall meet the requirements of Section 715.42.10.3.

Standard and expansion couplings and other fittings for the Type P conduit shall all be of the same materials as the conduit.

Other fittings for metal conduit shall be threaded malleable iron conforming to the requirements of ASTM A 338 and shall be galvanized in accordance with the requirements of ASTM A 153.

The size of conduit used shall be as shown on the Plans or as specified. If size is not shown on the Plans, the National Electrical Code shall govern as to the necessary conduit size.

659.2.3

659.2.3-Pull or Junction Boxes: Pull or junction boxes for structure installation shall be as shown on Plans or Type L. Boxes for ground (including sidewalk) installation shall be Type H (10x10). Type L shall meet the requirements of 715.42.11.1. Type H (10x10) shall meet the requirements of Section 715.42.11.2.

659.2.4-Cable: All wire and cable for sign lighting branch circuits shall conform to the requirements of the current edition of the National Electrical Code and shall meet all relevant ASTM Specifications. Conductors shall be coated softdrawn copper, unless otherwise noted on the Plans or in these Specifications. Insulation shall be Type THWN. Cable shall be UL approved.

Conductor sizes shall be standard American Wire Gauge sizes and shall be as noted on the Plans. All conductors shall be stranded. Stranded wire shall have a minimum of 19 strands.

Wire and cable for sign lighting projects included with roadway lighting projects shall be the same type as specified for the roadway lighting project.

All wire and cable shall have the size, voltage rating, and type of insulation and manufacturer's name permanently marked on the outer covering at regular intervals. The Manufacturer shall furnish to the Engineer and the Contractor all splicing or terminating information necessary for proper installation of the cable.

Color coding for sign lighting cables shall be permanent solid color as follows:

Single Phase		Three Phase	
Leg A	Black	Phase A	Black
Leg B	Red	Phase B	Red
Neutral	White or Natural Gray	Phase C	White or Natural Gray
Equipment Ground	Green	Equipment Ground	Green

Color coding of electrical conductors by use of phase tape or field paint is not acceptable. Conductors shall be manufacturer-colored, striped or ridge-marked.

Bare ground conductors shall be softdrawn copper, unless otherwise specified.

659.2.5-Connectors: Cable connections in boxes and handholes shall be made by means of connector kits, fused or non-fused, as indicated on the Plans. Splices for the signs shall be made by means of straight through or "Y" connector kits as required and as noted on the Plans. Where these connector kits cannot be used, as verified by the Engineer, connections on cables in

junction boxes shall be made by splicing as described elsewhere.

Fused "Y" connectors, if required, shall be composed of "Y" line side housing assembled with a load side and fuse terminal housing.

The housing shall be formed from water-resistant synthetic rubber. Each housing shall provide a water seal around the cables and when fully assembled shall form a watertight connector.

The interior shall be arranged to receive and retain line side wiring and the fuse contacts. The fuse contacts shall be spring-loaded copper designed for 30 amperes, 600 volts; shall have 90 percent minimum conductivity and shall be suitable for gripping a 10 amp, 600 volt cartridge-type midget fuse, 13/32 inch (10.3 mm) in diameter and 1-1/3 in. (33.9 mm) long. The contacts shall be fully annealed. The load side conductors shall be connected by crimping and the line side conductors shall be connected with screws. The connector shall be of the nonlocking type that will break off under extreme tensile stress leaving no exposed metal contacts on the line side of the connector.

The cable diameters used shall determine the size of each housing. The load side housing shall retain the fuse when disconnected.

Non-fused connectors shall be similar to the fused "Y" connectors. The cable diameter shall determine the size of each housing of each connector.

Fuses for connectors shall be rated at 10 amperes, unless otherwise noted.

659.2.6-Bonding and Grounding: Metallic cable sheaths, conduit, transformer cases, anchor belts, and metal poles and pedestals shall be made mechanically and electrically secure to form a continuous system and shall be effectively grounded. Bonding and grounding jumpers shall be copper wire or copper strap of the same cross sectional area as #4 AWG for all lighting systems.

Ground rods shall be copper clad steel, 3/4 inches (19 mm) in diameter with a minimum length as noted on the plans and shall be one piece. Sectional or segmented ground rods are not permitted. The ground rods shall be complete with ground clamp and square head bolt.

659.2.7-Service: Service equipment for a sign lighting system shall be provided as required by the Plans unless changed by the Engineer to meet a local condition. Where a meter is required, a meter base complete with sealing rings shall be installed by the Contractor. Installation of electric meter and final hookup shall be done by the serving utility company. A circuit breaker mounted in a NEMA Type 4 (dust and moisture proof) enclosure shall be installed as indicated on the Standard Drawings.

659.2.8-Wood Poles: All wood poles shall meet the requirements of Section 710.8.

659.2.9-Enclosures: Pole mounted enclosures for sign lighting shall of the type shown on the Plans and shall be NEMA Type 4 (dust and moisture proof).

659.2.10

The design shall be of AISI 300 Series stainless steel with a flange mounted switch handle and a double defeater cover lock mechanism. Enclosure locks shall be such that all enclosures on the project can be opened with the same key. Locks shall be of quality bronze construction with bronze keeper chains.

Enclosure mounting brackets for mounting the enclosure on the sign support shall be as shown on the Plans.

659.2.10-Sign Lighting Fixtures: Type 3 (Mercury Vapor Sign Light) 100, 175 or 250 Watt:

The Type 3 luminaire shall be of the remote ballast, 100, 175 or 250-watt as indicated on the plans, mercury vapor type, furnished complete with housing, mounting bracket, reflector, refractor, lamp socket, ballast and lamp; Hollophane, Guth, G.E. or equal as approved by the Engineer. The luminaire shall be 250 watt unless otherwise indicated.

The housing shall be die-cast aluminum with captive closed cell neoprene and felt double gasketing. Closure shall be positive by use of stainless steel pressure latches and stainless steel hinges.

The reflector shall be assymetric polished aluminum. The refractor shall be molded prismatic thermal shock resisting borosilicate glass.

The lamp socket shall be of a heavy duty type and be provided with adjustable settings for varying beam pattern.

The ballast shall be 100, 175 or 250 watt high power factor constant wattage or constant wattage auto transformer for use with appropriate lamp and system voltage.

The lamp shall be 100, 175 or 250 watt deluxe white mercury vapor heavy glass type with rated life of 24,000 hours, equal to ANSI Code H38-4HT (100), H39-22KB (175) or H37-5KB (250).

The complete luminaire optical assembly consisting of reflector, refractor, lamp socket position and lamps shall produce a light distribution conforming to the Isofootcandle and Utilization Curves of Guth Vertol Signliter, Hollophane 780 Express lite or equal as approved by the Engineer.

659.2.11-Photoelectric Controls (For Independent Sign Light System Only): Photoelectric controls shown on the Plans shall be capable of switching multiple fluorescent or mercury vapor luminaires directly.

The photocell shall consist of a light-sensitive element connected directly to a control relay and shall be equipped with circuitry designed to accept a supply voltage of 120 volts, unless otherwise indicated on the Plans.

The unit shall be preset to "turn on" between 1.0 and 3.5 footcandles. "Turn off" shall be at least two times the "turn on" level; however, "turn off" must be greater than 3.0 and less than 15.0 footcandles.

The unit shall meet all relevant NEMA standards and shall be twistlock type equipped for pole-top mounting using a slipfitter or conduit stem, or where pole-top mounting is impossible, bracket mounting to the side of the pole. The unit shall be north oriented.

CONSTRUCTION METHODS

659.3-GENERAL:

Existing electrical systems (traffic signal, highway and street lighting, flashing beacon, and sign illumination), or approved temporary replacements thereof, shall be in effective operation for the benefit of the traveling public during the progress of the work, except when shut-down is permitted to allow for alterations or final removal of the systems.

All systems shall be complete and in operation to the satisfaction of the Engineer upon completion of all the work. This includes field focusing of lamp fixtures.

659.3.1-Excavating and Backfilling: The excavations required for the installation of conduit, foundations, and other appurtenances shall be performed in such a manner as to cause the least possible damage to streets, sidewalks, landscaping, and other improvements. The trenches shall not be excavated wider than necessary for the proper installation of the electrical appurtenances and foundations. Excavation shall not be performed until immediately before the installation of conduit and other appurtenances. The material from the excavation shall be placed in a position that will not cause damage or obstruction to vehicular and pedestrian traffic or interfere with surface drainage.

All excavations shall be backfilled with suitable random material in horizontal layers not to exceed 4 inches (100 mm) after compaction. Each lift shall be compacted to the satisfaction of the Engineer. Testing is not required.

All surplus material shall be removed from the right-of-way and the backfill finished flush with surrounding natural ground, including replacement of any damaged facilities or appurtenances. The Contractor shall restore all areas disturbed by this excavation or other operations to their original conditions including grading, seeding, mulching and fertilizing as directed by the Engineer.

The Contractor shall employ hand excavation methods in areas where underground facilities exist, in order to avoid damaging these facilities. Any damage caused by the Contractor to existing facilities shall be repaired by the Contractor at his own expense, to the satisfaction of the Engineer. The Contractor will be responsible for all claims and damages for interrupted service and all other damage suits which may result from such interrupted service.

659.3.2-Removing and Replacing Improvements: Improvements such as sidewalks, curbs, gutters, portland cement and asphalt concrete pavement, bituminous surfacing, base material, lawn and plants, and any other improvements removed, broken or damaged by the Contractor's operations shall be replaced or reconstructed with materials of equal quality. The new work shall be left in a serviceable condition satisfactory to the Engineer.

659.3.3

Whenever a part of a square or slab of existing concrete sidewalk or driveway is broken or damaged, the entire square or slab shall be removed and the concrete reconstructed as specified.

The outline of all areas to be removed in portland cement concrete pavements shall be cut to a minimum depth of 4 inches (100 mm) with an abrasive type saw prior to removing the pavement material. The cut for the remainder of the required depth may be made by a method satisfactory to the Engineer. Cuts shall be neat and true with no shatter outside the removal area.

659.3.3-Conduit Installation:

659.3.3.1-Type R Conduit: Where pull boxes are installed adjacent to the base of a standard or a sign structure post, conduit installed between pull boxes and base shall not be less than 2 inches (50 mm) in diameter.

It shall be the option of the Contractor, at his expense, to use conduit of larger size than specified and where used, the larger size shall be for the entire length of the run from outlet to outlet. No reducing coupling will be permitted.

The ends of all conduits, whether shop or field cut, shall be reamed to remove burrs and rough edges. Cuts shall be made square and true so that the ends will butt or come together for the full circumference. Slip joints or running threads will not be permitted for coupling conduit. When a standard coupling cannot be used, an approved threaded union coupling shall be used.

The treads on all conduit shall be painted with a compound meeting specification MIL-P-21035 before the couplings are made up. All couplings shall be screwed up until the end of the conduits are brought together, providing a good structural connection throughout the entire length of the conduit run. Where the coating on the conduit has been damaged in handling or installation, such damaged places shall be painted with an approved rust preventative paint.

So far as practical, all conduit shall be run without traps. Where dips are unavoidable, a pull box or drainage tee shall be placed at each low point to drain any moisture accumulation. Conduit runs shall be made with as few couplings as standard length will permit and the total angle of all bends between any two boxes shall not exceed two quarter bends (180 degrees) unless otherwise approved by the Engineer.

Two cubic feet (600 cubic mm) of coarse aggregate (crushed stone or gravel) of a size and grade approved by the Engineer shall be placed at drainage tees for underground conduits.

Conduit bends, except factory bends, shall have a radius of not less than six times the inside diameter of the conduit. Where factory bends are not used, the conduit shall be bent without crimping or flattening, using the longest radius practicable.

Conduit shall be laid at a depth of not less than 18 in. (450 mm) below the curb grade in the sidewalk area, 36 in. (900 mm) below the highway pavement grade in the road areas, and 24 in. (600 mm) below the finished grade in all other areas. All conduit placed under paved roads shall have a minimum diameter of 2 inches (50 mm).

Conduit shall be placed under existing pavement by jacking or drilling methods. Pavement shall not be disturbed without the approval of the Engineer. All local subterranean utility maps shall be checked before any jacking or drilling operations begin.

The near side of the jacking or drilling pits shall have a four foot (1.2 m) horizontal clearance from the edge of any type of pavement wherever possible. Water jetting will not be permitted.

Conduit terminating in standards or pedestals shall have a projection above the foundation of 4 inches (100 mm) and shall be sloped towards the handhole opening.

Conduit ends shall extend into concrete Junction boxes at least 1½ in. (40 mm) and be equipped with approved bonding bushings. Conduit shall be 2 inches (50 mm) above the bottom, and shall be sloped to facilitate pulling of conductors. Conduit entering through the bottom of a pull box shall be located near the end walls to leave the major portion of the box clear. At all outlets, conduits shall enter from the direction of the run.

Expansion or deflection fittings, or both, shall be installed in metallic conduit runs at all joints in the structure to compensate for deflection and expansion. Expansion fittings shall be bonded with approved flexible tinned copper bonding jumpers.

Where new pull boxes are placed in existing conduit runs, the conduit shall be fitted with threaded bushings and bonded as shown on the Plans.

Conduit run on the surface of bridge structures shall be secured with approved strapping spaced not more than 5 feet (1.5 m) apart. Expansion fittings, as detailed on the structure Plans, shall be installed where the conduit crosses an expansion joint in the structure. Each expansion fitting shall be provided with a bonding jumper of at least # 6 AWG copper wire or equal.

Conduit leading to soffit, wall or other lights or fixtures below the grade of the pull box shall be sealed by means of an approved sealing fitting and sealing compound.

A # 12 AWG copperclad pull wire shall be installed in all conduits which are to receive future conductors. At least 2 feet (600 mm) of pull wire shall be doubled back into the conduit at each termination.

After backfilling is completed and prior to the installation of cable, all conduits, existing and new, shall be rodded throughout their entire lengths with a mandrel ¼ in. (6 mm) smaller in diameter than the conduit and 2 inches (50 mm) in length, and with a cylindrical wire brush the same diameter as the conduit.

659.3.3.2-Type P Conduit: Type P conduits shall be installed in accordance with the applicable methods as prescribed for Type R conduits, with regard to parallel conduit installations, coordinated with the existing or newly installed facilities.

Type P conduit shall be made watertight by joining with solvent in accordance with manufacturer's specifications. Ends terminating in junction

659.3.4

boxes shall be terminated with expansion couplings and end bells. Ends joining to metal conduit elbows at lighting standard foundations shall be connected through expansion couplings and adapters.

659.3.4-Luminaires: No luminaire shall be installed until the lamp socket position has been inspected and approved by the Engineer for conformance to the manufacturer's recommended position for the specified distribution.

The connections between the luminaire and connector kits shall be made with # 10 wires.

659.3.5-Pull Boxes: Pull boxes shall be installed at the locations shown on the Plans or, in long runs, shall be spaced at not more than 250 ft. (75 meters) It shall be the option of the Contractor, at his expense, to install additional pull boxes to facilitate his work.

Pull boxes shall be installed so that the covers are flush with the curb or sidewalk or 2 inches (50 mm) above the surrounding ground when no finished grade is established.

659.3.6-Cables: The Contractor shall provide adequate equipment for installation of cable, shall pull all wires through conduits in such a manner as not to overstress or stretch any wire, and shall use precautions so as not to score, cut, twist or damage the protective covering or insulation. In the pulling of cables in conduits, where the strain on the cables is likely to prove excessive, the Contractor shall use soapstone powder or other approved lubricant. Where two or more cables are to occupy the same conduit, they shall be drawn in together and kept parallel to each other by the use of a pulling head.

The Contractor, in connecting sockets, outlets and other similar equipment, shall ground the most accessible bare parts of each piece of equipment. In order to ensure that this has been done, each piece of equipment shall be tested after installation, and under the supervision of the Engineer, with a test lamp, one leg of which has been connected to a definite ground, or by other approved means of testing.

All cables in pull boxes and handholes shall be tested for circuit connections which shall be in conformity with those indicated on the detail drawings. All cables in junction boxes (pull boxes), manholes and standard bases shall be provided with individual non-corrosive metal (minimum 1½ in. (40 mm)) tags, die-stamped with control station, circuit and phase designation as applicable. Similarly designed tags shall be used in the switch boxes. The tags shall be securely attached to the cables with nylon cord of 1/16 in. (2 mm) minimum diameter.

Splices where necessary to form continuous circuits, complete and ready for operation, shall be made by the Contractor. Cable splices will be permitted only in accessible locations. Cable splices shall be accomplished by the use of manufactured splice kits. Splice design with a final wrap of tape will not be acceptable. Splice kits shall be installed strictly in accordance with the manufacturer's instructions.

Upon the completion of each wiring system, and before any connection is made to operating equipment, it shall be the responsibility of the Contractor to perform, in the presence of the Engineer, the following tests of each circuit to determine whether the installations are in acceptable working order:

- i. Tests for continuity
- ii. Tests for grounds
- iii. Tests for insulation resistance between circuit wires and from circuit wires to ground.

Upon completion of the electrical system, with fuses removed and before energizing, the insulation resistance shall be not less than fivemegohms.

659.3.7-Grounding:

659.3.7.1-General: The necessary conduit, conductors, bonding jumpers, clamps, connectors, ground rods, etc. for the grounding system shall be furnished, installed and connected by the Contractor.

Conduit systems must be effectively and permanently grounded with a cross section as required by the National Electrical Code and of capacity sufficient to ensure continuity and continued effectiveness of the ground connections for fault current. Ground conductors shall be as short and straight as possible, protected from mechanical injury and, if practicable, without splice or joint.

659.3.7.2-Codes and Approvals: All grounding work shall be done in accordance with the latest edition and revisions of the National Electrical Code and the regulations of State and local codes.

All connections in ground network shall be those of a type approved by NEC, Article 250.

659.3.7.3-Metal Conduits: All metal conduit ends shall be bonded and grounded by means of a # 4 bare copper cable. The grounding shall be accomplished by driving ground rods as detailed on the Plans and connecting it through a # 4 copper conductor in the foundation as shown on the Plans; or by driving ground rods through the junction box drainhole, and connecting it through a # 4 copper connector attached to a grounding stud on the sign lighting standard junction box frame, etc. The connection of the bonding cable to the junction box frames and to the shafts of the metallic sign lighting standard shall be done by means of a grounding stud, Burndy's Type K2C, Dossert Type DCM, or approved equal. Where the supply voltage is greater than 120/140, the neutral conductor shall be grounded at the service panels only with the neutrals of dry transformers.

At each service point, a ground electrode shall be furnished and installed. Ground electrodes shall be one-piece lengths of copperclad rod, diameter and length as shown on the Plans. Ground electrodes shall be installed in accordance with the provisions of the Code and as indicated on the Plans.

659.3.8-Service: Service points shown on the Plans are approximate only. The Contractor shall determine the exact locations from the serving utility.

Poles shall be placed in the ground to a depth of at least 5 feet (1.5 m).

The Contractor shall furnish conduit, conductors and all other necessary material to complete the installation of the service riser. Service riser conduit shall terminate with a weather head to prevent the entrance of water, as approved by the serving utility.

Where a meter is required, a meter base, furnished by the serving utility, shall be installed by the Contractor.

Each multiple service installation shall be grounded in accordance with the provisions in the Code.

Where an approximate service point is shown on the Plans, installation and materials for the connection between the actual service point, as established by the serving utility, and the nearest pull box of the electrical system shown on the Plans, shall be paid for by the Contractor.

Where a service point is omitted from the Plans, installation and materials for the connection between the service point, as established by the serving utility, and the nearest pull box of the electrical system shown on the Plans, shall be paid per section 109.4 and 104.3.

Upon request of the Contractor, the Engineer will arrange with the serving utility to complete the service connections and the Contractor shall pay all costs and fees required.

Upon request of the Contractor, the Engineer will arrange for furnishing electrical energy. Energy used prior to the completion of the contract will be charged to the Contractor, except that the cost of energy used for the public benefit, when such operation is ordered by the Engineer, will be borne by the Division.

When the power service is within a roadway lighting system, it shall be necessary only to provide the connections as shown on the Plans.

659.3.9-Field Tests: Prior to the completion of the work, the Contractor shall cause the following tests to be made on all lighting circuits, in the presence of the Engineer.

- i. Each circuit shall be tested for continuity.
- ii. Each circuit shall be tested for unspecified grounds.
- iii. A megger test shall be made on each circuit between the circuit and the ground. The insulation resistance shall not be less than the values specified in the provisions of the Code.
- iv. A functional test shall be made in which it is demonstrated that each and every part of the system functions as specified or intended.

After the installation is completed, the Contractor shall conduct a continuous 24-hour operating test for approval. In addition, final acceptance of an installation will not occur until 30 days of operation termed satisfactory by the Engineer.

During the 30 days of operation, the Contractor shall be responsible for repairing or replacing any defective equipment within 24 hours after being notified by the Engineer. After any malfunctioning equipment has been repaired or replaced, the 30-day test shall begin anew.

Where the sign lighting installation is a part of, and connected to, a roadway lighting installation, the functional test shall be the same as the functional test for the roadway lighting system.

659.3.10-Ballasts And Isolating Transformers: Splices at ballasts and transformers shall conform to the Code. Where more than one conductor enters a ballast or transformer sleeve, the insulation and taping shall be applied between the conductors in such a manner as to provide a watertight joint. The splice installation shall be capable of satisfactory operation under continuous submersion in water.

659.4-METHOD OF MEASUREMENT:

Measurement for payment for sign lighting will be based on each individual lighting system (normally one per overhead sign structure) complete in place, which will include power service, service poles, meter bases, switch box, polemounted enclosure, transformers, photoelectric controls, disconnects, junction boxes, cable, conduit, luminaires, lamps, ballasts, impact-proof shields and any other accessories or hardware as required to make a complete installation as called for on the Plans or as directed by the Engineer.

659.5-BASIS OF PAYMENT:

The quantity, determined as provided above, shall be paid for at the contract price for each installation for the item listed below, which price and payment shall be full compensation for furnishing all the materials and doing all the work prescribed in a workmanlike and acceptable manner. This price shall include all compensation for fabrication, delivery, erection and for any additional materials, tools, equipment, incidentals and labor not shown on the Plans or called for which are necessary to complete the installation of the various systems and as directed by the Engineer, including any necessary excavating and backfilling, restoring sidewalk, pavement and appurtenances damaged or destroyed during construction, salvaging existing materials and making all required tests.

659.6-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
659001-*	SIGN LIGHTING, TYPE "type"	LUMP SUM

*Sequence number

659-SIGN LIGHTING APPENDIX A STANDARD SPACING FOR TYPE 3 LUMINAIRE

USING DELUX WHITE MERCURY LAMP
(Where two or more signs have 3.0 ft. (1 m) or less
between the two signs, treat as one sign.)

SIGN OR GROUP LENGTH FEET (meter)	NUMBER OF LUMINARIES	DISTANCE OF FIRST LUMINAIRE FROM LEFT EDGE FEET (meter)	DISTANCE BETWEEN LUMINAIRES FEET (meter)

SECTION 660

TRAFFIC SIGNALS

660.1-DESCRIPTION:

This work shall consist of furnishing and installing various types of traffic signal systems. It shall include, but not be limited to, traffic signals and traffic signal interconnection systems to be installed in accordance with this Specification, as shown on the Plans or as directed by the Engineer.

All electrical work shall conform to current requirements of the *National Electrical Code*, latest edition, all local codes and Section 631 of the Standard Specifications.

All details not specified or not shown on the Plans shall conform to the requirements of the latest issue of the *Manual on Uniform Traffic Control Devices*, (referred to as the MUTCD). This Manual is published by the Federal Highway Administration of the U.S. Department of Transportation and supplemented by the publication "Official Ruling on Request" and the West Virginia Division of Highways Traffic Engineering Division Directives.

660.2-MATERIALS:

All materials shall be new and shall conform to the requirements of the following subsections of 715.42, Traffic Signals.

MATERIALS	SUBSECTION
Pre-Timed, Fixed Cycle Traffic Signal Controllers	715.42.1
Solid State Traffic Actuated Signal Controllers	715.42.2
Traffic Adjusted Master Controller (Type OPV)	715.42.3
Local Coordinating Units	715.42.4
Traffic Detectors	715.42.5

MATERIALS	SUBSECTION
Adjustable Face Signal Heads	715.42.6
Auxiliary Traffic Signal Equipment	715.42.7
Cabinets	715.42.8
Signal Supports	715.42.9
Electrical Conduit	715.42.10
Junction Boxes	715.42.11
Messenger Cable	715.42.12
Conductors	715.42.13
Supplemental Flashing Beacons & Mountings	715.42.14

Within 15 day following the award of the Contract, the Contractor shall submit to the Engineer a list of equipment and materials which the Contractor proposes to install. The list shall be complete as to the name of manufacturer, size, and identifying number of each item. The list shall be supplemented by such other data as may be required, including detailed scale drawings and wiring diagrams of any special equipment. A signed statement shall accompany the materials list stating that the materials meet the applicable requirements of these Specifications.

CONSTRUCTION METHODS

660.3-GENERAL:

Construction methods shall conform to the requirements of the Plans and the latest issue of the West Virginia Division of Highways Standard and Supplemental Specifications, except as modified.

660.4-MAINTAINING TRAFFIC:

During the installation of traffic signals and appurtenances, the roadway shall be kept open to all traffic by the Contractor in such a way that both local and through traffic will be adequately and safely accommodated through the work area. See the Manual, "Traffic Control for Street and Highway Construction and Maintenance Operations", and applicable sections of the Standard Specifications.

660.5-REMOVING EXISTING SIGNAL EQUIPMENT:

Existing traffic signal equipment at the intersection shall be removed by the Contractor. If there is not a pay item in the proposal, the Contractor shall

660.6

remove the signal heads, controller and poles and render the equipment unusable as traffic control devices. If there is a pay item in the Proposal for signal removal, the Contractor shall remove the controller, signal heads, hardware and poles, if required, in such a manner so as not to damage the equipment. These heads, controllers and poles shall be turned over to the Engineer and become the property of the Division. Salvaged wire and conduit shall become the property of the Contractor.

When a foundation is to be abandoned, the top of foundation, anchor bolts, and conduits shall be removed to a depth of not less than 6 inches (150 mm) below the surface of the sidewalk or unimproved ground. The resulting hole shall be backfilled with material equivalent to the surrounding material.

660.6-REMOVING AND REPLACING IMPROVEMENTS:

Existing improvements, such as sidewalks, curbs, gutter, portland cement and asphalt concrete pavement, underlying material, lawns and plants, and any other improvements removed, broken or damaged by the Contractor's operations, shall be replaced or reconstructed with the same kind of material as found on the work or with materials of equal quality. The new work shall be left in a serviceable condition.

Whenever a part of a square or slab of existing concrete sidewalk, curb, gutter, or driveway is broken or damaged, the entire square, section or slab shall be removed and the concrete reconstructed as specified above.

The outline of all areas to be removed in portland cement concrete sidewalks and driveways and in pavements shall be cut to a minimum depth of 2 inches (50 mm) with an abrasive-type saw prior to removing the sidewalk, driveway and pavement material. Cuts shall be neat and true with no shatter outside the removal area.

660.7-EXCAVATING AND BACKFILLING:

Excavations required for the installation of foundations, conduit and other appurtenances shall be performed in such a manner as to avoid any unnecessary damage to streets, sidewalks, landscaping, and other improvements. Pavement cuts and excavations shall be no wider than necessary for the proper installation of the electrical appurtenances and foundations, or as required for the proper replacement of pavements or other improvements.

Excavation shall not be performed until immediately before installation of conduit, foundations or other appurtenances. The material from the excavation and the equipment used in the excavation shall be placed in a position that will least interfere with surface drainage and that will least obstruct vehicular and pedestrian traffic.

At the end of each day's work, and at all other times when construction operations are suspended, all equipment and other obstructions shall be removed from the portion of the roadway open for use by vehicular and pedestrian traffic. All surplus excavation material shall be removed and disposed of, within 48 hours, outside of the highway right-of-way, unless otherwise directed by the Engineer.

All excavations shall be backfilled with suitable random material in horizontal layers not to exceed 4 inches (100 mm) after compaction. When the trench width is less than 12 inches (300 mm), each lift shall be compacted to the satisfaction of the Engineer. Testing is not required. When the trench width is 12 inches (300 mm) or greater, each lift shall be compacted to 95 percent of the maximum dry density. All surplus material shall be removed from the right-of-way and the backfill finished flush with surrounding natural ground, including replacement of any damaged facilities or appurtenances. The Contractor shall restore all areas disturbed by this excavation or other operations to their original conditions including grading, seeding, mulching and fertilizing as directed by the Engineer.

660.8-FOUNDATIONS:

Foundations for controller cabinets and signal support structures shall be of Class B portland cement concrete and shall be proportioned, mixed and placed in accordance with Section 601 of the Standard Specifications or as specified.

All reinforced material used in signal support structures shall be in conformation with Sections 602 and 709 of the Standard Specification.

The Contractor shall inform the Engineer when the excavation is complete and no concrete shall be placed until the Engineer has approved the excavation for each individual foundation. No foundation shall be set over recent fill of extensive depth or muck except by the approval of the Engineer. For foundations set in solid rock see Standard Details.

Foundations shall conform to the sizes and shapes shown on the Plans and shall be monolithic. Forms shall be used for the top 12 in. (300 mm) of a foundation; they shall be true to line and grade and securely braced in place. Tops of foundations shall be finished to curb or sidewalk grade or as directed by the Engineer.

When embedded poles are used, a pre-cast concrete block or concrete cast in place 24 hours before setting the pole, shall be set in the bottom of the foundation excavation as shown on the Standard Detail sheet. Suitable anchoring devices to hold the embedded pole in the proper positions, until the surrounding concrete has set for at least 12 hours, must be provided. These devices must be approved by the Engineer and the pole shall not be allowed to be set without such devices.

Anchor bolts shall be accurately set in accordance with a detail furnished by the pole manufacturer. Conduit ends and anchor bolts shall be held in the proper position and to the proper height by means of a template until the concrete sets.

Forms shall be oiled and excavation surfaces that come in contact with the concrete shall be thoroughly moistened before concrete placement. Forms shall not be removed until the concrete has thoroughly set.

Ordinary surface finish as described in Section 601 of the Standard Specifications shall be applied to exposed surfaces of concrete.

660.9

All concrete foundations shall be allowed to set for 72 hours before any support structures are installed.

Support structures shall be plumb or raked as directed by the Engineer.

Foundations for wooden poles shall be excavated to dimensions slightly larger than the pole diameter and the excavation around the pole shall be backfilled with suitable random material in horizontal layers not to exceed 4 inches (100 mm) after compaction. Each lift shall be compacted to the satisfaction of the Engineer. Testing is not required.

Depth of the pole foundation shall be as specified on the Plans. A device to hold the wooden pole in place with the proper rake until backfilling is complete shall be provided. Blocks wedged between the excavation and the pole are not acceptable.

Ground rods shall be $\frac{3}{4}$ inch in diameter with a minimum length as shown on the Plans and shall be one piece. Sectional or segmented ground rods are not permitted. All signal supports shall have ground rods. The ground rods shall be complete with ground clamp and square head bolt.

660.9-LOOP TRAFFIC DETECTORS:

Installation shall conform to the details and notes shown on the Plans.

Slots cut in the pavement for the loop conductor shall be neat and true to the dimensions shown on the Plans. Slots shall be blown out and dried before loop conductors are installed.

The # 14 THWN stranded loop conductor shall run continuous and unspliced from the roadway loop to a junction box or conduit as indicated in the Plans. Each loop shall consist of a single separate wire and shall be connected to the detector by a separate lead-in wire. The loops shall consist of three turns of wire, unless otherwise specified.

All loop wire installation shall be made without damage to the wire or its insulation and all damaged wires shall be replaced. The wire must be so placed that there are no kinks or curls and no straining or stretching of the insulation.

It shall be installed and secured as deep in the slot as possible. A blunt object, similar to wooden paint stirrer shall be used to seat the loop wire. A screwdriver or other sharp tool shall not be used for this purpose.

Prior to placing the loop slot sealant, the loop wire shall be checked for continuity, resistance and insulation integrity. Insulation integrity shall be checked by applying a megger between each end of the loop wire and the nearest reliable electrical-ground street light, fire hydrant, etc. If no available ground exists, a suitable ground shall be established for the measurement, (e.g., driven metal spike). The megger reading shall be in excess of ten megohms under all conditions, (500 volts DC). The continuity and megger checks shall be recorded by the Engineer.

Lead-in wire from the loop conductor to the detector terminal strip shall be two # 14 AWG solid copper.

The lead-in wire shall also be continuous and unspliced from junction box or conduit to the detector terminal strip in the cabinet.

Splices between the loop conductor and the lead-in wire shall be soldered

with fuseable metal or alloy. These splices shall first be joined and made mechanically secure and tested electrically. No spring connectors will be allowed for splicing. When the mechanical connection has been shown to be electrically functional under operational conditions, it shall then be soldered. Each splice shall then be insulated with a permanent, waterproof covering as specified or as approved by the Engineer. Waterproof adhesive shall be applied to the splice and on at least 2 inches (50 mm) of loop wire and lead-in wire insulation on both sides of the splice. The splice shall then be covered with half-lapped, $\frac{3}{4}$ in. (19 mm), self-bonding electrical tape; starting at the center of the splice and proceeding to $\frac{3}{4}$ in. (19 mm) onto the wire insulation, returning to the center of the splice. The entire splice shall then be wrapped with half-lapped, $\frac{3}{4}$ in. (19 mm), all-weather electrical tape using the same procedure as above. When both ends of the loop wire and lead-in wires are so spliced and wrapped, both splices shall then be wrapped together with $\frac{3}{4}$ in. (19 mm), all-weather electrical tape. The entire splice area to the end of the adhesive coating shall be covered. The splice shall then be completed by inserting a four-inch (100 mm) piece of all-weather electrical tape into the "V" formed by the loop wires.

The loop slot cuts in the pavement shall be filled with a permanent, flexible weatherproof sealant after the placement of the loop wire in the slots. The sealant shall be resistant to traffic, water, gasoline, chemical fumes, mild alkalis, oils and mild acids; no noticeable deterioration of the sealant shall be apparent after exposures to temperatures ranging from minus 20° F (-6° C) to plus 160° F (71° C). Before sealing the loop, slots must be clean and dry and blown out with oil-free air. The sealant shall be placed to within $\frac{1}{8}$ in. (3 mm) of the pavement surface and surplus sealant shall be removed from the adjacent road surfaces without the use of solvents.

The loop slot sealant shall be of "Weatherban 101 Sealer" as manufactured by the 3-M Company or an approved equal.

660.10-SIGNAL HEADS:

All signal heads shall be either plumb or level, symmetrically arranged, and securely assembled. All suspended heads shall be provided with leveling hangers and balance adjusters. In addition, all signal head faces shall be aimed and secured in the direction of traffic they control.

Signal heads suspended from messenger cable and mast-arm suspended heads that are not rigidly mounted shall be attached directly to the cable or mast-arm hanger and balance adjuster. If approved by the Engineer, one head per span or mast arm may be lowered to the proper height by use of $1\frac{1}{2}$ in. galvanized steel piping connecting the signal head to the cable or mast-arm hanger. If piping is used, it must be painted to match the signal-head housing and a positive permanent means of securing the head to the pipe to prevent rotation shall be provided. In all cases, piping of signal heads should be avoided if possible.

All red sections of signal heads on a single span or mast arm shall be at the

660.11

same elevation.

Optically programmed signal heads shall have a permanent, rigid mount fitting to assure reliable control of visibility. Programmed heads shall be aimed, fixed and programmed to control vehicle or pedestrian traffic only in the cut-off area specified on the Plans and as directed by the Engineer.

All type signal heads that are installed before a signal system is made operative shall be hooded with a black plastic material that will completely conceal the signal faces (even when lit) as well as cover the entire signal head. The material shall be weather resistant and fastened in such a way that it will be completely wind resistant.

660.11-CABINETS:

The cabinets for all types of traffic controllers or flasher units shall be mounted and installed at the location shown on the Plans and in accordance with typical installation details. No mounting holes or special outlets shall be made through the cabinet walls without the specific approval of the Engineer.

Adjustable steel bands or universal cabinet mounting bands shall not be used for mounting cabinets to poles or pedestals. Cabinets mounted on wood poles shall be attached with wood pole mounting brackets, secured with lag screws.

660.12-SUPPORT STRUCTURES:

Strain and mast-arm poles shall be installed with the amount of rake recommended by the pole manufacturer. The rake shall assure a substantially vertical set when the load is applied. For anchor base type poles, threaded adjusting nuts shall be used to establish the rake. The use of shims or other leveling devices is not permitted. Hardware and fittings shall be installed as shown on the manufacturer's installation drawings. When embedded or wooden poles are used, the rake shall be established as the pole is set.

Pedestal poles supporting only a vertical dead load shall be installed in a true vertical plane.

The Contractor shall take full responsibility for checking all cross sections to determine final support lengths.

660.13-MESSENGER CABLE:

When completely loaded the messenger cable, cable rings and conductor wire shall present a straight, clean, neat appearance. Excessive slack shall be pulled out of conductor wire and the ring supports shall be set at 15-in.(375 mm) centers.

Span wire sag shall be kept at a practical minimum and in no case exceed five percent of the span.

660.14-CONDUIT:

Conduit runs shown on the Plans may be changed to avoid underground obstructions with the written approval of the Engineer. Approximate lengths of conduit are shown on the Plans. The Contractor shall determine the exact

lengths of conduit in the field.

The ends of all conduits, whether shop or field cut, shall be reamed to remove burrs and rough edges. Cuts shall be made square and true so that the ends will butt or come together for the full circumference thereof. Standard conduit couplings shall be used for joining all metal conduit. Slip joints or running threads will not be permitted for coupling conduit. However, expansion fittings shall be installed where the conduit crosses an expansion joint on a structure. Continuity through the expansion fitting shall be provided by means of # 6 AWG copper wire jumper. Conduit runs on the surface of structures shall be secured with galvanized malleable iron clamps spaced not more than 5 feet (1.5 m) apart.

The threads on all ferrous metal conduit shall be painted with rust preventative paint before couplings are made up. All couplings for metal-type conduit shall be tightened until the ends of the conduit are brought together, providing a good electrical connection throughout the entire length of the conduit run. Where the coating on metal conduit has been damaged in handling or installing, such damaged places shall be painted with an approved rust preventive paint. Exposed ungalvanized threads on metal conduit resulting from field cuts shall be painted with an approved rust preventative paint.

All metal-type conduit ends shall be threaded and shall be capped with a standard pipe caps until wiring is started. When caps are removed, the threaded ends shall be provided with conduit bushings.

Conduit bends, except factory bends, shall have a radius of not less than six times the inside diameter of the conduit. Where factory bends are not used, conduit shall be bent, without crimping or flattening, using the longest radius practicable.

A # 12 AWG galvanized pull wire shall be installed in all conduits which are to receive future conductors. At least 2 feet (600 mm) of pull wire shall be doubled back into the conduit at each termination. All conduit runs shall be free of dirt, debris and excessive moisture before cable is pulled.

Existing underground conduit to be incorporated into the new system shall be cleaned with a mandrel or cylindrical wire brush and blown out with compressed air.

Conduit shall be laid to a depth of not less than 18 in. (450 mm) below finished grade in all areas, except that conduit may be laid on top of and secured to the existing pavement within new curbed medians being constructed on top of the pavement.

Rigid metal conduit shall be placed under existing pavement by approved jacking or drilling methods. Pavement shall not be disturbed without permission from the Engineer. In the event obstructions are encountered, upon approval of the Engineer, small test holes may be cut in the pavement to locate obstructions. Jacking or drilling pits shall be kept 2 feet (600 mm) clear of the edge of any type of pavement wherever possible. Water jetting will not be permitted.

Conduit terminating in pile or pedestal bases shall extend 4 inches (100

660.15

mm) vertically above the foundation and shall be sloped towards the hand-hole opening. At all conduit termini, the conduit shall enter the outlet from the direction of the run. Conduit size shall be the same for terminal point to terminal point. No reducing couplings will be permitted.

If it is determined by the Engineer that it is impractical to bore the conduit under concrete or asphaltic pavement due to unforeseeable obstructions, the Contractor may, with the Engineer's permission, cut the existing pavement. The pavement shall be cut along neat and true lines by means of a concrete saw. The depth of the trench shall be as specified and the width shall be the minimum required for proper excavation and backfilling. The trenching operation, along with replacement operation, shall be performed according to Standard Detail TES-04. Concrete shall be allowed to set for a minimum of 49 hours without being exposed to traffic. At no time shall more than one-half of the roadway be closed for any conduit placement operations.

Conduit to be placed beneath railroad tracks shall comply with the following:

The conduit shall be rigid metal type, 2 in. (50 mm) minimum size and shall be placed to a minimum depth of 5 feet (1.5 m) below the bottom of the tie. The near side of each conduit jacking pit shall be constructed not less than 12 ft. (3.6 m) from the centerline of track. When the jacking pit is to be left overnight it shall be covered with substantial planking.

660.15-JUNCTION BOXES:

Junction boxes shall be installed at the locations shown on the Plans or, in long runs, they shall be spaced at not over 200 ft. (60 m) intervals. The Contractor may, at his own expense and with the approval of the Engineer, install additional junction boxes to facilitate his work.

The tops of junction boxes installed in the ground or in sidewalk areas shall be flush with the surrounding grade or pavement.

Concrete junction boxes shall be poured in place. However, pre-cast junction boxes may be used, when in the opinion of the Engineer, the surrounding subgrade has sufficient bearing qualities to support the box and cast iron frame.

All junction boxes shall be set on at least 12-in. (300 mm) bedding of aggregate base material as shown on the Plans. Grouting shall be done prior to the installation of conductors. No junction boxes shall be set on uncompact ground.

Concrete work shall be done in accordance with the applicable requirements of 660.8.

660.16-WIRING:

Sufficient five-conductor signal light cables shall be provided to perform the functional operation of the signal system and, in addition thereto, one spare conductor of a size equal to the largest signal light conductor in the run, except neutral, shall be provided throughout the signal light system.

No more than two signal heads shall be on the same conductor run. When

two signal heads are on the same conductor run, they must be of the same signal color sequence.

All signal light conductors shall be run continuously without splices from the terminal block located in a cabinet, compartment, or signal head, to a similarly located terminal block, unless otherwise specified on the Plans. Signal light conductors shall not run to a terminal block on a standard unless they are to be connected to a signal head that is mounted. All spare wires shall be placed on a special terminal block mounted in the controller cabinet for this purpose.

Five-conductor IMSA cable as specified shall be provided for all signal light circuits. This cable shall consist of red, orange, green, black and white insulated wires. The insulation color shall correspond as nearly as possible to the associated signal sequence color.

Permanent identification labels shall be attached to all controller and detector cabinet wiring to identify circuit and associated phase. Sequence color need not be identified if clearly indicated by conductor insulation color.

Wiring diagrams, detailing on one sheet all wires in the controller cabinet that are external to the controller itself, must be included with all signal systems. The diagrams must be complete and show all connections including switches, terminal block, connectors, relays and all other mechanisms in the cabinet. Other wiring for the controller shall be as required by the wiring diagrams and instructions furnished with the controller by the manufacturer.

Connection to each terminal of a pedestrian push button shall be by # 14 AWG single conductor in two-wire IMSA cable as required. The neutral for pedestrian push button circuits shall be separate from the signal light circuit neutral. Pedestrian push button circuits shall be limited to 12 volts AC or DC.

Conductors shall be pulled into conduit by hand. The use of winches or other power actuated pulling equipment will not be permitted. Powdered soapstone, talc, or other inert lubricants shall be used in placing conductors in conduit. When conductors are to be added to existing conductors in a conduit, all conductors shall be removed; the conduit shall be cleaned as provided in 660.14, and both old and new conductors shall be pulled into the conduit as a unit.

Where signal conductors are run in lighting standards containing high-voltage series street lighting conductors, either the signal conductors or the lighting conductors shall be encased in flexible or rigid metal conduit, to a point where the two type of conductors are no longer in the same raceway. Where telephone circuits are installed adjacent to signal and lighting circuits, the telephone conductors shall be encased in UL approved flexible metal conduit.

All wiring shall be installed in a neat and workmanlike manner. Conductors within fixtures or cabinets shall be cabled together with self clinching nylon cable ties, waxed lacing or other method permitted by the Engineer. Wiring within the controller cabinet shall be firm, neatly arranged and laced, or enclosed in plastic tubing or raceways. The finished wiring shall present a neat, clean appearance so that individual wires may be easily traced

660.16

to their terminal points. Unnecessary slack in the conductor wires will not be permitted. Wiring workmanship shall be subject to the approval of the Engineer.

The ends of wires which are to be attached to terminal blocks of the barrier screw type shall be provided with solderless terminals that meet the requirements of the National Electrical Code. These terminals shall be the pre-insulated positive grip type. The terminal crimping tool shall produce a transverse crimp on the wire. Wires which insert into a positive wire insert type terminal block will not require terminals. No more than two conductors shall be brought to any one terminal.

On all pin and receptacle type connections, the receptacle shall be on the line side of the circuit.

Conductor splices may be permitted only in the following types of circuits at the following locations:

- i. Loop conductor and lead-in wire in junction boxes at traffic detectors.
- ii. In modified traffic signal systems where shown on the Plans (low voltage only).

Splices, where permitted, may only be made at points of access in conductor runs or raceways (handholes, junction boxes, etc.) and no splices shall be permitted in controller cabinets. All splices, with or without connectors, shall be soldered by the pouring or dipping method, except that soldering of pressure connectors and terminals may be omitted provided the connectors and terminals are applied with the proper type tool as recommended by the manufacturer of the connector or terminal being applied. Finished connections and terminals shall comply with the requirements of Military Specification MIL-T-7928. Splices shall be insulated by one of the following methods:

- i. Cast insulation of self-curing epoxy resin which is compatible with the wire insulation to form a moisture resistant joint. The resin shall be resistant to weather, with aromatic, straight chain solvents, and shall not sustain combustion. The resin shall be cured into molds of dimensions suitable for the splice.
- ii. A minimum of two thicknesses of electrical insulating pad, composed of a laminate of 0.085-in. (2 mm) thickness of electrical grade polyvinyl chloride and a 0.125-in. (3 mm) thickness of butyl splicing compound with removable liner. Pads shall be applied to the splice in accordance with the manufacturer's recommendations. The ends of the applied pad shall be wrapped with the polyvinyl chloride tape half lapped over the conductor insulation.
- iii. Heat shrinkable insulating tubing shall be applied after completing the splicing procedure shown on the Plans. Insulation over the connector shall consist of a heat shrinkable, mastic lined, heavy wall

polyolefin cable sleeve or cover, to which heat shall be applied at a temperature greater than 120EC until the sleeve or cover shrinks and covers the connector, and the mastic material has flowed completely around the cable to form a waterproof insulation.

Electrical tape shall be UL approved and be one of the following types:

- i. Self-fusing, oil and flame-resistant, synthetic rubber.
- ii. Pressure sensitive, adhesive, polyvinyl chloride, 0007 in. (178 μ m) minimum thickness.

Where polyvinyl chloride tape is used for a final layer, an electrical insulating coating shall be used which shall be fast drying, resistant to oil, acids, alkalies and corrosive atmospheric conditions and compatible with the tape.

All splices shall be noted on the Plans and approved by the Engineer.

Unless otherwise specified, shown on the Plans or directed by the Engineer all signal system conductors shall run continuous and unspliced from terminal to terminal. Signal system conductors shall include but not be limited to power service wires, signal circuit conductors, controller panel wiring, controller wire harness, loop lead-in and loop wire. System interconnect cable shall be continuous and unspliced from controller cabinet terminal to controller cabinet terminal.

660.17-POWER SERVICE:

The power connection shall be made to a single-phase 120/240 volt, three-wire, 60Hz, AC supply. The approximate location of utility service points may be shown on the Plans; however, the Contractor shall determine the exact location of the power supply. Each signalized intersection or control unit shall have a separate power service and no more than one power service shall be utilized per intersection or unit.

Electrical service installation and materials shall conform to the requirements of the serving utility. The service equipment shall be installed as soon as possible to enable the utility to schedule work well in advance of the completion of the project.

Enclosed circuit breakers, external to the controller cabinets, shall be provided in the power service. Four singlepole breaker units rated at 30 amps each are required. The breaker enclosure shall be weathertight with a top hinge cover, hasp for sealing cover and provisions for padlocking the cover. The Contractor shall provide an all-weather padlock and two sets of keys with each power service. Circuit breakers shall be approved and listed by the Underwriter's Laboratory.

Breakers # 1 and 2 shall provide power for the signal control equipment (controller cabinet). Specifically circuit breaker # 1 shall power the controller circuits and # 2 shall power the flasher and associated circuitry. These two

660.18

circuits must be of the same polarity. Breakers # 3 and 4 are spare terminals to accommodate future lighting circuits and breakers 3 and 4 must be of opposite polarity to provide a 240 volt circuit.

The Contractor shall make all arrangements for connection to the power supply and shall obtain a meter and meter socket from the power company at the time these are required. The Contractor shall furnish, install, pay installation fee and provide all materials necessary for the power connection not provided by the power company.

All external power service wiring from the service head or service point on shall be enclosed in rigid metal conduit; this includes equipment ground wires.

When complete and in place the power service shall provide in the signal controller cabinet, two separate fused 120 VAC, 60 Hz power sources rated at 30 amps each of the same polarity or phase.

660.18-TESTING:

660.18.1-Operational Field Tests: Upon completion of the installation of a traffic signal system, operational field tests shall be run on each and every part of the system. After the initial field tests are run satisfactorily, the Contractor shall conduct a continuous 12-hour operating test for approval.

Upon successful completion of the 12-hour test and with the approval of the Engineer, a 30-day test period will then be initiated. Final acceptance of an installation will not occur until 30 days of system operation are completed and termed satisfactory by the Engineer.

A final inspection may be conducted by the Division at any time prior to completion of the 30-day test. At the option of the Engineer, equipment found to be defective during this inspection may warrant the renewal of the full or any part of the operational test period.

In addition, the Contractor shall be responsible for equipment malfunctions that occur during any test period. The Contractor shall repair or replace any defective equipment within 24 hours after being notified by the Engineer. After the repair has been effected, the Engineer may at his option renew any or all of the operational test period.

660.19-METHOD OF MEASUREMENT:

660.19.1-Signal Controllers: Signal controllers shall be measured as a complete unit in place by intersection or control location. This item shall consist of the complete electrical mechanism for controlling the operation of traffic control signals, including the timing mechanism and all necessary auxiliary equipment mounted in a cabinet or other enclosure.

Included under signal controllers shall be traffic adjusted master controllers and computers and associated equipment. This item shall include cabinets or other enclosures as required.

660.19.2-Traffic Detectors: Traffic detectors shall be measured per unit complete and in place, mounted in a cabinet or enclosure as required. This item

shall consist of the detector tuning unit only. Roadway traffic sensors such as loops, probes, etc. shall be considered "Miscellaneous Signal" items. Cabinets or other enclosures as required for the detector tuning units shall also be included in "Miscellaneous Signal".

660.19.3-Signal Sections: Signal heads shall be measured complete and in place by signal head section. Red, yellow, green, arrow and walk-don't walk signal sections shall be considered complete when assembled on the support structure in accordance with the signal head configuration shown on the Plans. Both vehicular and pedestrian heads shall be included in this item. In addition, this item shall include all the necessary hardware for mounting the signal heads to the support structures. Optical programming shall be included in this item.

660.19.4-Signal Supports: Signal supports shall be measured as a complete unit in place, per mast arm structure or per pole support, including foundation. This item includes guys, messenger cable and anchor bolts for support structures, but does not include such items as controller cabinet mounting brackets and signal head mounting hardware covered in other sections.

660.19.5-Junction Boxes: Junction boxes shall be measured as a complete unit in place. This item includes aggregate base, concrete, iron frame and cover as required. All junction boxes shall be included under this item both units constructed for the signal system as well as those required for the signal interconnect.

660.19.6-Signal Interconnect: Signal interconnect shall be measured as a complete unit in place per interconnected system. This item includes most of the materials and construction related to the signal interconnection system only. Supports and wire-ways constructed primarily for other purposes shall not be included in this item. Conduit, support structures, support hardware wire and messenger cable installed solely for the interconnect system shall come under this item. This item shall not include coordinating units or interconnect system junction boxes.

660.19.7-Miscellaneous Signal: Miscellaneous signal items as required to complete a traffic signal system in accordance with the Plans or these Specifications shall be measured complete in place by intersection or control location. This item shall include but not be limited to power services, electrical conduit, vehicle sensors (loops, probes, etc.), pedestrian push buttons and all wiring, appurtenances and work not included in other Contract items.

660.19.8-Signal Removal: Signal removal shall be measured as a complete unit by intersection. It shall include the furnishing of all necessary equipment and labor to adequately remove the existing signal equipment as

660.20

necessary to meet the requirement of the Plans. The existing roadway and traffic control devices shall be maintained or revised as required during construction to assure the safe and expedient movement of traffic (See 660.4).

660.20-BASIS OF PAYMENT:

660.20.1-General: When accepted as complete, the quantities determined as provided above will be paid for at the contract unit price bid for the items listed below, which prices and payments shall be full compensation for furnishing all materials and doing all the work prescribed in a workmanlike manner, including excavating, backfilling, replacing sidewalks and pavements, replacing curb and gutter, disposal of waste and debris and for furnishing all labor, equipment, tools, and incidentals necessary to complete the work.

Unit bid prices shall be submitted as indicated on the Plans per code unit, type or intersection number.

660.20.2-Traffic Detectors: Pay item codes shall be as follows:

(LPS)-Loops

(PBS)-Probes

660.20.3-Signal Sections: Pay item codes shall be as follows:

(V-8)--8" ((V-203) --203 mm) Vehicle Signal Sections (R, Y or G)

(V-12)--12" ((V-305) -- 305 mm) Vehicle Signal Sections (R, Y, G or ARROW)

(V-8P)--8" ((V-203) --203 mm) Programmed Vehicle Signal Sections (R, Y or G)

(V-12P)--12" ((V-305) -- 305 mm) Programmed Vehicle Signal Sections (R, Y, G or Arrow)

(P-9)--9" ((P-229) -- 229 mm) Pedestrian Signal Sections (W-DW)

(P-12)--12" ((V-305) -- 305 mm) Pedestrian Signal Sections (W-DW)

660.20.4-Signal Supports: Pay item codes shall be as follows:

(Type)--Poles and Mast Arms

(PED)--Pedestal

660.20.5-Junction Boxes: Pay item codes shall be as follows:

(Type)--H or L

660.20.6-Signal Removal: Payment for traffic signal removal shall be in accordance with one of the following:

- i. If there is a pay item in the Contract for Signal Removal, the Contractor shall remove the equipment as specified and payment shall be one lump sum, per intersection basis.
- ii. If there is not a pay item in the Contract for Signal Removal, and removal is required for completion of the Contract, existing signal

660.21

equipment shall be removed by the Contractor unless otherwise specified. No additional compensation will be paid and removal work as well as salvage value of equipment if applicable, shall be considered in the bid price for “Miscellaneous Signal” items.

Removal and disposition of salvaged equipment shall be in accordance with 660.5 of these Specifications.

660.21-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
660001-*	SIGNAL CONTROLLER	LUMP SUM
660002-*	TRAFFIC DETECTOR, “type”	EACH
660003-*	SIGNAL SECTION, “type”	EACH
660004-*	SIGNAL SUPPORT, “type”	EACH

SECTION 661

TRAFFIC SIGNS AND DELINEATORS

661.1-DESCRIPTION:

This item shall consist of the fabricating, furnishing, and erecting of a complete system of traffic signs and delineators in accordance with the requirements of the Plans and of these specifications. All details not specified or not shown on the Plans shall conform to the details and requirements set forth in the following specifications and publications:

Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals, latest issue, including revisions, American Association of State Highway and Transportation Officials (AASHTO). *Manual on Uniform Traffic Control Devices for Streets and Highways*, latest issue, including revisions, as printed by the Federal Highway Administration, U.S. Department of Transportation. (Referred to as the MUTCD).

Standard Alphabets for Highway Signs, as printed by the Federal Highway Administration, U.S. Department of Transportation. *West Virginia Manual of Uniform Traffic Control Devices, Fabrication Details*, latest issue, including revisions. (Referred to as the Fabrication Manual).

661.2-MATERIALS:

The criteria for sampling, inspection, and acceptance of signing material are documented in MP 661.02.40.

661.2.1-Aluminum:

661.2.1.1-Sign Panels: Panels shall be of the type specified in the Plans and shall meet the following Specifications:

661.2.1.1.1-Sheets: Aluminum for sheet sign panels shall be Alloy 6061-T6, ASTM B 209 or Alloy 5052-H38, and shall meet the ASD fabrication requirements for mill products. For signs using porcelain enamel background on sheet aluminum, the Contractor shall use an alloy which has been recommended by the manufacturer and approved by the Engineer, specially designed and prepared for the application of porcelain enamel.

661.2.1.1.2-Extrusions: Aluminum for the extruded panels shall be Alloy 6063-T6, ASTM B 221.

661.2.1.1.2-Structural Shapes: Structural shapes, rolled or extruded, used for sign framing or mounting brackets shall be of Alloy 6061-T6 or Alloy 6063-T6, ASTM B 211 or B221.

661.2.1.1.3-Hardware: Aluminum for hex lock nuts for use with post clip bolts and stitch bolts shall conform to Aluminum Alloy 2017-T4. Lock nuts

shall have anodic coating conforming to MIL-A-8625. Thread fit shall be as recommended by the manufacturer.

Flat washers for use with stitch bolts and post clip bolts shall conform to current ASTM B 209, aluminum alloy 2024-T4 or Alclad 2024-T4. Washers shall be used with all lock nuts and stitch bolts.

Spring, lock-washers shall conform to current ASTM B 211, Alloy 7075-T6, aluminum alloy bars, rods and wire.

Post clips shall conform to current ASTM B 108, Alloy 356-T6, aluminum base alloy permanent mold castings.

Post clip bolts and stitch bolts shall conform to current ASTM B 211, Alloy 2024-T4, aluminum alloy bars, rods and wire. Bolts shall have an anodic coating and shall be chromate sealed in accordance with MIL-A-8625.

Nuts, 1/4 in. (6 mm) top and under, and all bolts and machine screws shall be made from Alloy 2024-T4, ASTM B 211. Nuts 5/16 in. (8 mm) and over, shall be Alloy 6262-T9, ASTM B 211. All nuts, bolts and machine screws shall have an anodic coating with a chromate seal conforming to MIL-A-8625.

U-bolts shall be fabricated of 2024-T4 aluminum alloy conforming to ASTM B 211 and connecting clips shall be fabricated of 6061-T6 aluminum alloy conforming to ASTM B 221.

661.2.1.4-Demountable Copy: Demountable copy, including all items of legend and border, shall be fabricated of aluminum 0.040 in. (1 mm) thick sheet conforming to ASTM B 209, Alloy 5052 H38.

Demountable copy shall be coated with white type II high-intensity sheeting unless another color is specified on the Plans.

Demountable legend shall be in accordance with the current MUTCD. Combined upper and lower case alphabets shall be Series E modified by widening the stroke width to approximately one-fifth of the letter or numeral height of the upper case alphabet. Capital alphabets shall be Series D modified by widening the stroke width to approximately one-fifth of the letter or numeral height.

661.2.1.5-Rivets: All rivets used for the attachment of demountable copy shall be blind, dome head, self-plugging or pull through type mandrel, made of aluminum alloy that will not produce streaking or discoloring of the sign face. The manufacturer of the rivets shall determine the method of rivet application.

All rivets used for the attachment of delineators shall be blind, dome head, self-plugging or pull through type mandrel. The rivets shall be an aluminum alloy.

661.2.2-Steel: Hardware-Low carbon steel bolts and nuts shall be in accordance with ASTM A 307. Manufacturer's markings on A 307 bolts will not be required. High strength steel bolts, nuts, and washers shall be in accordance with ASTM A 325. Stainless steel bolting materials shall be in accordance with ASTM A 320 and shall be of the type recommended by the

661.2.3

manufacturer of the material. Galvanizing, if required, should conform to ASTM A 153. Cadmium plating, if required, should conform to ASTM B 766, Class 12 (0.47 mils) (12 μm).

Material used for banding and buckles, clamps, bolts, and lockwashers shall be stainless steel.

Steel clamps for attaching sign to tubular supports shall be of two types. Type I, a light duty clamp shall be capable of withstanding loads equivalent to a sign area of 20 sq. ft. (2 sq. m) and shall be fabricated from material meeting the requirements of ASTM A 575 or A 576, Grade 1020. Type II, a heavy duty clamp, shall be capable of withstanding the loads equivalent to a sign area of 80 sq. ft. (7.5 sq. m) and shall be fabricated from material conforming to the requirements of ASTM A606, A607 or ASTM A242.

Steel shapes and plates used as mounting hardware or as sign framing shall be Grade 1020 conforming to ASTM A 575 or A 576.

Steel for delineator supporting brackets shall be commercial quality steel galvanized in accordance with ASTM A 123.

661.2.3-Enclosed Lens Reflective Sheeting: The reflective sheeting shall conform to [715.9.2.1](#).

661.2.4-Reflex Reflectors: The reflectors shall conform to [715.9.2.4](#).

661.2.5-Delineators: A delineator shall consist of one reflective unit of the color required, assembled separately or in groups of two or three, on steel flanged channel bar post, or on metal brackets in accordance with Standard Drawings and the following Specifications:

661.2.5.1-Reflex Reflector: Single reflective units shall be a minimum of 3 inches (75 mm) in diameter. A unit shall consist of a reflex reflector and an 0.020-inch (508 μm) thick aluminum housing conforming to ASTM B-209, Alloy 5052, with one center-mount hole for attachment to the support.

Reflective units shall be attached to the posts or brackets with aluminum rivets.

The reflector shall consist of a clear and transparent plastic face, with seven square inches (4 500 sq. mm) of reflective area, referred to as the lens with a heat sealable plastic coated metallic foil back fused to the lens under heat and pressure around the entire perimeter of the lens and the central mounting hole to form a unit permanently sealed against dust, water, and water vapor.

Specific Intensity-The specific intensity of each reflector intended for use in delineators shall be equal to or exceed the following minimum values, with measurements made with the reflector spinning. Failure to meet the specific intensity minimum shall constitute failure of the reflector being tested; failure of more than two reflectors out of fifty subjected to test shall constitute failure of the lot.

Observation Angle (Degrees)	Entrance Angle (Degrees)	Specific Intensity (Candlepower/Footcandle)	
		White	Amber
0.1	0	119	71
0.1	20	47	28

Test procedure shall be in accordance with MP 107.07.21.

661.2.5.2-Encapsulated Lens: Single reflective units shall be 4 by 4 inches (100 mm by 100 mm). A unit shall consist of silver or yellow encapsulated sheeting permanently adhered to a flat sheet aluminum (Alloy 6061-T6, ASTM B 209 or Alloy 5052-H38) 0.080 inches (2.03 mm) thick with one center-mount hole for attachment to the support. The flat sheet aluminum shall be prepared in accordance with 661.3.4.

Reflective units shall be attached to the posts of brackets with aluminum rivets.

The reflective material shall conform to the requirements of 661.2.10.

Prior to manufacture and fabrication, a sample of each type of delineator assembly shall be submitted by the Contractor to the Engineer for written approval, if delineator assemblies are not similar to those shown on the Plans.

661.2.5.3-Three Unit Delineators: The three unit delineator shall consist of three reflex reflector delineators (661.2.5.1) riveted to a 6 x 15-inch (150 by 375 mm) aluminum sheet (Alloy 6061-T6, ASTM B 209 or Alloy 5052-H38) of 0.125-inch (3.18 mm) thickness. The aluminum sheet shall be primed with high quality synthetic baking primer and enameled with yellow enamel.

661.2.5.4-Nine Unit Delineators: The nine unit delineator shall consist of reflex reflector delineators (661.2.5.1) riveted to a 18 x 18-inch (450 by 450 mm) aluminum sheet (Alloy 6061-T6, ASTM B 209 or Alloy 5052-H38) of 0.125-inch (450 by 450 mm) thickness. The aluminum sheet shall be primed with high quality synthetic baking primer and enameled with yellow enamel.

661.2.6-Inks: Inks for reflective sheeting shall meet the requirements of Section [711.13](#).

661.2.7-Nylon Washers: Nylon washers shall be of commercial grade.

661.2.8-Route Markers for Guide Signs: Route marker shields to be mounted on guide signs shall be fabricated using aluminum alloy 6061-T6 or 5052-H38, ASTM B209. The minimum thickness of the aluminum sheet shall be 0.040 inches (1.02 mm). All shields shall be attached to the guide signs using

661.2.8.1

approved rivets.

661.2.8.1-Reflective Guide Signs: U.S. and State route marker shields shall have white encapsulated lens, reflective sheeting background, with black nonreflective sheeting numerals.

Interstate shields shall have red and blue encapsulated lens, reflective sheeting background, with white numerals and border.

661.2.8.2-Blank

661.2.9-Nonreflective Sheeting: Nonreflective sheeting shall conform to the requirements of [715.9.2.2](#).

661.2.10-Encapsulated Lens Reflective Sheeting: The reflective sheeting shall conform to [715.9.2.3](#).

CONSTRUCTION METHODS

661.3-FABRICATION:

661.3.1-General: Fabrication of all sign parts shall be in accordance with the dimensions shown on the Plans and approved shop drawings. Work shall be done in a uniform workmanlike manner.

661.3.2-Shop Drawings: If not as shown on the Plans, the Contractor shall submit to the Engineer for approval scale drawings, eight copies, of those signs having variances, showing arrangement and spacing of all letters, symbols and borders for all signs having demountable legend, attachment of sign panels, and copies of all layout templates for silk screen signs.

If a method of attaching sign panels to supports is other than as shown on the Standard Drawings, the Contractor shall submit to the Engineer for approval detailed drawings, eight copies, showing the proposed method of attaching each type of sign panel to each type of support.

661.3.3-Metal Cutting and Refinishing: Panels one-half inch (13 mm) thick or less shall be cut by one of the following methods: sheared, blanked, sawed or milled. Panels over one-half inch (13 mm) thick shall be sawed or milled. Re-entrant cuts shall be filleted by drilling prior to cutting. No flame cutting will be permitted. Cut edges shall be refinished to present a true and smooth edge that is free from burrs and ragged breaks. Holes shall be made in such a manner as not to affect the finished surface.

661.3.4-Sign Panel Preparation: Prior to application of ink or reflective sheeting to the sign panels, they shall be given a chemical conversion treatment meeting the requirements of ASTM B449, Class 1 or 2.

All fabrication, including cutting, welding, riveting, and punching of holes

other than mounting holes for demountable letters, numerals, symbols and borders, shall be completed prior to surface preparation. However, it will be permissible to weld studs to panels after application of sheeting.

661.3.4.1 Through 661.3.4.3 -Blank

661.3.4.4-Handling: Sign panels shall not be handled, except by mechanical devices or clean canvas gloves, between all cleaning and etching operations and the application of reflective sheeting. There shall be no opportunity for metal to come in contact with grease, oils, or other contaminants after cleaning and etching and prior to the application of the background material.

661.3.5-Application of Reflective Sheeting: The application of reflective sheeting to the backing material shall be in full accordance with instructions of the manufacturer of the reflective sheeting used.

Reflective sheeting shall cover one entire side of the flat sheet blank, which side shall be the sign face. When applied to extruded sign panels, reflective sheeting shall be rolled over each edge of the extrusion $\frac{1}{4}$ in. (6.35 mm) (plus $\frac{1}{16}$ in. (1.6 mm), minus 0 in. (mm)) to prevent an opened surface on the sign face.

Reflective sheeting shall be applied mechanically in a manner specified by the manufacturers of the reflective sheeting.

Signs 48 in. (1.2 m) and less on the shorter side shall be covered by a single piece of reflective sheeting. On signs larger than 48 in. (1.2 m), adjacent pieces shall be carefully matched for color to provide uniform reflective quality. All seams shall be straight and the edges of adjustment pieces shall be overlapped a minimum of $\frac{3}{16}$ in. (5 mm) the length of the seam.

661.3.6-Application of Copy:

661.3.6.1-Demountable Copy: Each letter, symbol and border shall be supplied with mounting holes and shall be secured to the sign surface with approved rivets. The use of tape, glue or other substance to secure the copy to the sign face during fabrication or in its final form, other than approved rivets, will not be allowed.

Demountable letters, digits, borders and alphabet accessories shall be attached flush against sign faces after background material has been applied.

Spacing of all legends and borders shall be as specified with an allowable tolerance of plus or minus 2 percent on any individual measurement as shown on the Plans or approved shop drawings. A sufficient number of rivets shall be used to securely fasten demountable legends and borders to sign panels.

661.3.6.2-Screen Processing: All legends or borders on signs, except demountable letters or borders, shall be applied by screen processing, reverse

661.3.7

screen processing, or cut out letters after the reflective sheeting is applied to the panels. All screening shall be done in a workmanlike manner and as recommended by the manufacturer of the reflective sheeting. The Contractor may apply legends and borders to signs having reflectorized backgrounds by equally effective methods after approval of the Engineer. All legends, borders and backgrounds shall be of the color specified and placed on the sign as shown on the Plans.

The screening shall be done in a manner which results in a uniform color and tone, with sharply defined edges of legend and border and without blemishes on the sign background. Where screening is required, free hand painting will not be permitted. Proper size screen mesh shall be used in reverse screening to ascertain that the finished colors match the prescribed Standard Interstate Colors.

661.3.7-Sign Panels:

661.3.7.1-Flat Sheet: Flat sheet signs shall be fabricated of a single piece of sheet material without joints and without supporting frame. The height or width of the sign shall be within plus or minus 1/8 in. (3 mm) tolerance of the dimensions indicated on the Plans. Corner radii shall be within plus or minus 1/16 in. (1.6 mm) tolerance of the dimensions shown on the Plans.

The following minimum thickness shall be used for the appropriate width unless the height of the sign is less than half the width, in which case the next heavier gauge (up to 0.100 in. (2.54 mm)) shall be used. The width is measured perpendicular to the post.

{ENGLISH}

Width (Inches)	Thickness Based On	
	Single Post Mounting (Inches)	Two Post Mounting (Inches)
Up to 30 Inclusive	0.080	----
31 to 37 Inclusive	0.100	----
38 to 47 Inclusive	0.100	0.800
48 to 60 Inclusive	0.100	0.100
61 to 72 Inclusive	0.100	0.100

{METRIC}

Width (mm)	Thickness Based On	
	Single Post Mounting (mm)	Two Post Mounting (mm)
Up to 750 Inclusive	2.03	----
751 to 925 Inclusive	2.54	----
926 to 1 175 Inclusive	2.54	2.032
1 176 to 1 500 Inclusive	2.54	2.54
1 501 to 1 800 Inclusive	2.54	2.54

Panels shall have dimensions and corner radii in accordance with the Standard Drawings and shall be punched only with the holes necessary for proper mounting. Signs shall be free of buckles, warp, dents, and burrs prior to the application of reflective sheeting or other background material. Dimples or indentations shall not be noticeable from a distance of 10 feet (3 m) normal to the sign.

661.3.7.2-Extruded Panels: Extruded panel signs shall consist of extruded aluminum channel sections, bolted together at the flanges, to form a surface of the length, width, and depth required, to which the legend, border, and background have been applied.

The panel sections shall be of the shape, dimensions, and weight shown on the Standard Drawings. This section as shown is nominal and an alternate extruded panel section of equal or greater section modulus and having dimensions suitable to utilize hardware as shown on the Standard Drawings may be supplied by the Contractor upon receipt of the written approval of the Engineer. No splicing of sections will be permitted.

The sections shall be within the established commercial tolerances of the aluminum industry.

Each panel shall be flat and true within ¼ in. (6.35 mm) tolerance on an 8 ft. (2.4 m) length, with proportionately greater allowance on longer lengths. Flatness across the face of each panel shall be limited to 0.004 in. per inch (100 µm per 25.4 mm) of width.

The panels shall be assembled in the shop and firmly bolted to form a sign of the length and width required. Before bolting, the webs of the panels shall be in the same plane to form a smooth and uniform surface and the ends shall be free from projections. Adjacent panels shall be color matched both day and night.

It is intended that the sign shall be fabricated as a single unit. If the largest signs cannot be shipped as a single unit, they may be sectionalized as approved by the Engineer. All signs must be completely shop assembled but if field joining of panels is permitted, legend and border units which overlap the

661.3.7.3

joining must be removed and replaced in the field.

661.3.7.3-BLANK

661.3.7.4-Clear Coating and Edge Sealing: Signs to which reflective sheeting has been applied shall not be clear coated, except when it is recommended by the manufacturer of the sheeting. Edge sealer shall be applied to all splices and edges as recommended by the sheeting manufacturer.

661.3.7.5-Packaging: All signs shall be protected by packaging during shipment and storage. The packing shall be adequate to prevent damage to any part of the sign, including any demountable legends or borders. Before packaging, all signs shall be free of moisture and all paints shall be thoroughly dry. Adhesive tapes shall not be applied to any sign surfaces. All packaged signs shall be kept entirely dry.

Signs delivered for use on a project shall be stored off the ground and under cover in a manner meeting the approval of the Engineer.

Signs reflectorized with encapsulated lens sheeting shall be packaged and stored as specified, with careful consideration to avoid friction or rubbing between signs; shall be kept dry and at an ambient temperature not to exceed 150° F (66° C); and shall be stored on edge to prevent excessive pressure on the surface of the sheeting.

661.3.8-Application of Nonreflective Film: Nonreflective film shall be mechanically applied and processed in accordance with the recommendation of the film manufacturer.

Nonreflective sheeting shall be clear coated and force cured as recommended by the manufacturer of the sheeting.

661.4-ERECTION:

661.4.1-General: All signs and delineators shall be erected at the points designated on the Plans or by the Engineer in accordance with these Specifications and in reasonable close conformity to the locations, elevations and angles shown on the Plans or established by the Engineer.

Before starting the erection of signs, the Contractor shall establish the location of each sign in accordance with the Plans or as directed by the Engineer, and mark each sign site with construction stakes, having clearly indicated the sign number of the respective sign. The Contractor shall furnish stakes, paint, other materials and labor for performing the locating and staking as described. When the sites have been staked and are ready for inspection, the Contractor shall inform the Engineer, who will check and approve the site or make necessary changes. Centerline station information will be furnished to the Contractor by the Engineer.

The Contractor shall take full responsibility for checking all cross sections at approved sign locations to determine final support lengths. The supports

shall not be fabricated until such time as the above measurements prove acceptable to the Engineer. Upon approval of location and support length, the Contractor shall erect the proper sign at the staked location and complete all work.

After installation of the signs, they shall be inspected at night by the Engineer. If specular reflection is apparent on any sign, its positioning shall be adjusted by the Contractor at his expense to correct this condition.

661.4.2-Location of Ground Mounted Signs: Signs shall be oriented to minimize or eliminate specular reflection.

Ground mounted signs longer than 48 in. (1.2 m) shall normally be mounted at 93 degrees away from the direction of, and facing, the traffic that they are intended to serve.

On curves, structural posts shall be located and erected so as to face the sign at an angle of 85 degrees from the line of sight. The line of sight is defined as the line between the center of the sign and the centerline of the traffic lane adjacent to the sign. Its length in feet is equal to 50 (meters is equal to 0.6) times the letter height, in inches (mm), of the smallest legend in the major line of copy. (Example: 50 by 12 in. letter equals 600 ft. in the line of sight). (Example: 0.6 by 300 mm letter equals 180 meters in the line of sight).

Ground mounted signs shorter than 48 in. (1.2 m) shall normally be mounted approximately at right angles to the direction of, and facing, the traffic that they are intended to serve.

661.4.2.1-Multi-lane Roadways: Signs on the thru roadway and on ramp entrances and exits at the thru roadway shall have the following clearance from the roadway:

In ground installations, the signs shall be erected at a height, measured from the edge of the pavement to the bottom of the sign, as indicated in the following table, unless otherwise specified on the Plans. If, however, a secondary sign is mounted below a guide sign, the major sign shall be at least 8 feet (2.4 m) and the secondary sign at least 5 feet (1.5 m) above the level of the pavement edge unless otherwise specified on the Plans.

SIGNS	HEIGHT (Ft)(m)	MEASURED TO
Route Marker Assemblies	7 (2.1 m)	Bottom of Lowest Sign
Regulatory Signs	7 (2.1 m)	Bottom of Sign
Warning Signs	7 (2.1 m)	Bottom of Sign
Truck Weight Station Signs	7 (2.1 m)	Bottom of Sign
All other signs	7 (2.1 m)	Bottom of Sign

661.4.2.2

Overhead signs shall provide a clearance of not less than 17 ft. (5.2) over the entire width of the pavement and shoulders.

For roadways with no curbs or mountable curbs, the minimum horizontal clearance to any roadside sign or overhead sign structure shall be 4 feet (1.2 m) beyond the edge of the paved roadway shoulder, to either the right or left. Where there is an unmountable curb or guardrail, the horizontal clearance shall be at least 2 feet (600 mm) beyond the face of the curb or guardrail.

Mileposts shall be located in line with delineators and at a height of 4 ½ ft. (1.350 m), measured between the grade of the pavement and the bottom of the sign panel.

661.4.2.2-Other Roadways: Signs on frontage roads, roads or streets affording access to the multi-lane roadway, and on ramps (other than at the multi-lane roadway) shall have the following clearance from the roadway.

The bottom of the roadside signs shall be 7 feet (2.1 m) above the level of the roadway edge. If however, a secondary sign is mounted below the major sign, the secondary sign shall be at least 6 feet (2.1 m) above the level of the pavement edge.

When signs are placed over the pavement, a clearance of 17 ft. (5.2) shall be provided between the surface of the pavement and the bottom of the lowest part of the sign structure.

Roadside signs and overhead structures shall be placed at the edge of the road shoulders and normally shall have a horizontal clearance of two to twelve feet (0.6 to 3.6 m) beyond the edge of the pavement or travelway, except where conditions do not permit, or where otherwise shown on the Plans. Where a raised curb, guardrail, or paved shoulder is present, a sign shall ordinarily be placed with its nearest edge at least 2 feet (0.6 m) outside such curb line, guardrail, or paved shoulder.

661.4.3-Location of Delineators: The reflective units of the delineators shall be positioned to be clearly visible for a distance of 1,000 ft. (300 m) wherever possible during night time under normal weather and atmospheric conditions when illuminated by the upper beam of standard automobile headlights with the vehicle located in the right hand traffic lane approaching the delineator.

Reflective units shall be attached with aluminum rivets of suitable length as follows:

- i. One white unit shall be attached to posts or brackets located along the right side of the main roadway.
- ii. One white unit shall be attached to posts or brackets along the right of the main roadway through interchange areas and on the right side of the connecting roadways and ramps through the interchange area.
- iii. One amber unit shall be attached to posts or brackets along the left side of the connecting roadways and ramps as necessary through the interchange area.

- iv. Two white units shall be attached vertically to all posts along the right side on acceleration and deceleration lanes.
- v. Two amber units shall be attached vertically on each face of posts or brackets located in the center of dividers less than 8 feet (2.4 m) in width on ramps.

Post mounted delineators shall be supported by flanged channel bar posts of the material, design, and dimensions specified in 657.

When the required longitudinal spacing of posts falls on a structure, delineator brackets, Type A, Type B, or Type C shall be installed instead of a post as shown on the Standard Drawings. Bracket mounted delineators shall be supported on aluminum or steel brackets of the materials, design, and dimensions in accordance with these Specifications and the Standard Drawings. Type A delineator brackets shall be used on bridge railing with horizontal members having a round section. Type B delineator brackets shall be used on bridge railing with horizontal members having a rectangular section. Type C delineator brackets shall be used on bridges having no horizontal bridge rail members.

When the delineators are located above the top rail, the bracket shall be mounted on the fascia side of the railing. The required height of the top of the bracket shall be measured from the surface of the roadway at the edges of the traveled lane as projected from the adjacent fill sections, or as indicated by the pavement edge markings. Brackets shall be fastened to the member of the bridge rail by means of a stainless steel band and hardware as indicated on the Standard Drawings.

Delineators, three per unit or nine per unit, shall be attached as shown on the Standard Drawings to the post at the approach end of channelizing islands within the roadway or at other locations as designated by the Engineer.

661.4.4-Attaching Sign Panels:

- i. Flat sheet: Flat sheet signs shall be attached to supports, after the supports are erected, using a nylon washer and a flat steel washer between the sign face and bolt head, a lock washer between U channel posts and nuts as shown on the Standard Drawings. Bolts, nuts and flat and lock washers shall be cadmium plated.
- ii. Extruded Panel: After the supports are firmly set, the signs shall be mounted as shown on the Standard Drawings and Plans or as recommended by the manufacturer of the panels. All panels shall be horizontal, the faces shall be flush within commercial tolerances, and the face of the sign shall be flat. All hardware used in erection of the sign shall conform to the Standard Drawings and these Specifications. Any appreciable buckling, warping, or other defects in the panels shall be cause for rejection of the entire sign.

661.4.5

661.4.5-Final Clean Up: Before final inspection, the Contractor shall perform any touching up on paint finishes, cleaning of exposed sign and support surfaces, and leveling and repair of the site as may be deemed necessary by the Engineer to insure the effectiveness and neat appearance of the work.

661.5-METHOD OF MEASUREMENT:

661.5.1-Signs: Measurement for payment for all types of signs will be based on the area in square feet (meters) of the sign faces. Areas shall be calculated to the nearest 0.01 sq. ft. (m) for each sign and to the nearest square foot (m) for the total quantity. The area of any sign shall be the area of the smallest rectangular, triangular or trapezoidal shape that will encompass the entire sign; except for extruded panel signs, which shall have an area equal to the smallest combination of rectangular, triangular, or trapezoidal shapes that constitute the sign.

661.5.2-Delineators: Measurement for payment for delineators will be based on the actual number of delineators necessary to complete the work.

661.5.3-Delineator Brackets: Measurement for payment for delineator brackets will be based on the actual number of delineator brackets necessary to complete the work.

661.5.4-Installation of Reusable Signs: Measurement for payment for installation of reusable signs will be based on the actual number of reusable signs that are designated on the Plans, and are necessary to complete the work. This quantity, shall be plan quantity, unless the Engineer determines the plan quantity to be in error and changes the quantity of reusable signs to be installed.

661.6-BASIS OF PAYMENT:

The quantities, determined as provided above, shall be paid for at the contract unit price for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all work prescribed in a workmanlike and acceptable manner, including all tools, equipment, supplies, and incidentals necessary to complete the work. All incidental work and materials for which no basis of payment is provided will be considered as completely covered by the prices bid for the items included in the Contract.

661.6.1-Signs: Payment will be made at the contract unit price per square foot (m) of sign for the appropriate type of sign. This price shall be full compensation for fabricating, furnishing, and attaching the sign or sign assembly to the post or posts as shown on the Plans or specified. It shall include the furnishing of the aluminum sign panels; all framing, bracing, attachment, and connections necessary to attach the signs to the supports; furnishing and applying the reflective sheeting, or other sign facing material;

furnishing and applying the demountable copy or the process material and screens for screening the legend and border to the sign face as required by the Plans; furnishing all hardware required for the above; and all labor, equipment, tools, and incidentals necessary to complete the work. This item does not include posts.

661.6.2-Delineators: Payment will be made at the contract unit price per reflective unit for each color actually installed. The price shall include fabrication, furnishing and installing the reflective unit, suitable length aluminum rivets, aluminum rivet collar, and all other material, labor, equipment, and tools necessary to complete the installation. This item does not include the post or Type A, Type B, or Type C brackets.

661.6.3-Delineator Brackets: Payment will be made at the contract unit price per bracket for each type actually installed, which price shall include the fabrication, furnishing and installing of the bracket, all necessary hardware and all other materials, equipment, labor and tools necessary to complete the installation.

661.6.4-Installation of Reusable Signs: Payment will be made at the contract unit price per installation of reusable sign. This price shall be full compensation for transporting the sign to the nearest possible location shown on the Plans and erection of the sign, including furnishing the necessary hardware and all other material, labor, equipment and tools necessary to complete the installation.

SECTION 662 ROADWAY LIGHTING

662.1-DESCRIPTION:

This item shall consist of manufacturing, furnishing and installation of a lighting system in accordance with the requirements of the Plans and of these Specifications. All details not specified or not shown on the Plans shall conform to the details and requirements set forth in the following specifications and publications:

Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals, latest issue, American Association of State Highway and Transportation Officials (AASHTO).

National Electrical Code

American National Standards Institute

In addition to the Plans, these Specifications and the above noted publications, any applicable local code shall apply.

662.2-MATERIALS:

Materials furnished by the Contractor shall be of new stock, shall be the product of the reputable manufacturers of lighting equipment, shall conform to Division of Highways' Specifications and shall meet the approval of the Engineer.

All materials shall conform to Division 700 of the Standard Specifications and specifically as follows, unless otherwise modified on the Plans. Reference specifications for materials shall be understood to be the latest available specification and revision at the time of award of the contract.

662.2.1-Concrete: All concrete shall conform to Standard Specifications, Section 601, Types B or K (Bridge Superstructure).

662.2.2-Reinforcing Steel Bars: Reinforcing steel bars shall conform to the applicable requirements of Section 602 of the Standard Specifications.

662.2.3-Electrical Conduit: Electrical Conduit shall meet the requirements of Section 715.42.10.

662.2.3.1-Type R (Rigid Steel Conduit): Type R (Rigid Steel Conduit) shall meet the requirements of Section 715.42.10.1.

662.2.3.2-Type F (Flexible, Liquid-Tight Conduit): Type F (Flexible, Liquid-Tight Conduit) shall meet the requirements of Section 715.42.10.2.

662.2.3.3-Type P (Polyvinyl Chloride Conduit): Type P (Polyvinyl Chloride Conduit) shall meet the requirements of Section 715.42.10.3.

662.2.4-Junction Boxes: The following Specifications shall set forth minimum design requirements for junction boxes for lighting cable and other electrical wiring. The type shall be noted on the Plans.

Junction boxes as shown on the Plans shall be installed where indicated. The Contractor may, with the approval of the Engineer and at his own expense, install additional junction boxes to facilitate the work of installing conduit and pulling cable.

662.2.4.1-Types A, B and C: Types A, B, and C shall meet the requirements of Section 715.42.11.4.

662.2.4.2-Type L (Light Duty): Type L (Light Duty) shall meet the requirements of Section 715.42.11.1.

662.2.4.3-Type H (Heavy Duty): Type H (Heavy Duty) shall meet the requirements of Section 715.42.11.2.

662.2.5-Manholes: Manholes shall be constructed to the dimensions shown in the Plans. Unless otherwise noted on the Plans, all units shall be completely equipped with the necessary cable racks, rack insulators, frames and covers, and all other appurtenances detailed on the Plans and approved by the Engineer.

Concrete manholes shall be monolithic construction and maybe either precast or cast in place.

662.2.5.1-Cable Rack: The cable rack assembly shall be a combination of Line Material Company Catalog Nos. DU17B2, DU581 or DU582, DE11U1, and WDU4M1, Joslyn Catalog Nos. J5124, J5131 or J5132, and J5122, or equal.

662.2.5.2-Pulling Iron: The pulling iron shall be Line Material Company Catalog # DU2T2, Joslyn Catalog # J8119, or equal.

662.2.5.3-Ground Connector: The ground connector shall be Burndy Company Type KC22B1, Dossert #DGN-5, or equal.

662.2.6-Ground Rods: Ground rods shall be copperclad steel, $\frac{3}{4}$ inches (19 mm) in diameter with a minimum length as noted on the plans and shall be one piece. Sectional or segmented ground rods are not permitted. The ground rods shall be complete with ground clamp and square head bolt.

662.2.7-Roadway Luminaires: All castings shall be smooth, clean and free from cracks, blisters, pockets, voids, rough or chipped spots, or other similar defects.

662.2.7.1

The luminaire shall have a slipfitter capable of accepting mounting tenons made from 2 in. (50 mm) pipe and adjustable plus or minus three degrees about the tenon axis. No additional parts shall be required to accomplish the adjustment.

The luminaire shall have a terminal block prewired into the electrical system so that only two connections from the # 10 AWG tap wires need be made.

The ballast compartment shall be immediately accessible via a separate cover door such that the lamp area need not be opened to service the ballast.

The luminaire shall have a removable, parabolically formed aluminum reflector system with a finish as recommended by the manufacturer.

The luminaire shall have a porcelain mogul base socket capable of being adjusted along both the longitudinal and vertical axis of the lamp proper. A lamp grip shall also be provided at the socket.

The reflector-refractor chamber shall be gasketed with synthetic rubber or dacron felt gasket and filtered, when available for fixture type, with a replaceable activated charcoal or fiberglass filter such that the chamber shall be waterproof and dust-tight.

The refractor lens shall be cast for borosilicate glass or, when specified on the Plans, vandal resistant polycarbonate resin. It shall be temperature, shock and ultraviolet resistant and shall be free from visible cracks, blisters, bubbles, flashed or sharp flanges, or other similar defects.

The optical system shall produce the IES standard distribution patterns as specified and shall be capable of accepting internal, external, or internally molded--in shielding.

When so designated on the Plans, the luminaire shall be of a total cut-off type design, specially fabricated to recess the lamp and having a flat lens.

662.2.7.1-Luminaire Wattages: The luminaires shall be manufactured by General Electric, McGraw-Edison, Sylvania, American Electric or shall be approved equal.

The luminaires shall be designed to accommodate the appropriate lamps as called for on the Plans and Listed in [662.2.9](#).

662.2.7.2-Luminaire Ballasts: Luminaire ballasts shall be designed to rapidly restrike the lamp in the event of an outage and shall start the lamp at a minimum temperature of -20°F (-29°C).

The ballasts for high pressure sodium lamps shall be of the high power-factor type (93 to 99 percent), similar to constant wattage type, and shall be rated to the circuit voltage and lamp wattage specified. The ballasts shall deliver rated lamp current at line-voltage variation of plus or minus 10 percent, with no more than plus or minus 5 percent of lamp wattage regulation. Starting aids shall be of the encapsulated type.

662.2.7.3-Area Luminaires: The luminaire requirements for "area" and "walkway" lighting shall be as called for in the Plans and in accordance with

the latest edition of Special Provisions, Section 662, "SAFETY REST AREA LIGHTING" Subsection 662.11, Area Lighting Luminaires. Other portions of 662.2.7 above named shall not necessarily apply.

When incorporated as part of a Roadway Lighting project, the "area" or "walkway" type luminaire shall be Post Top Mounted on Type VII aluminum poles in accordance with 662.2.13.3. In this case, the "area" or "walkway" type luminaire shall be paid for under Item 662070-*, "LUMINAIRES", per each.

662.2.8-Underpass Luminaires: The luminaire housing shall be die-cast aluminum and shall be gasketed to form a weatherproof and dusttight unit. All castings shall be smooth and clean and free from cracks, blisters, pockets, voids, rough or chipped spots, or other similar defects.

The assembly shall be prewired. The refractor shall meet the requirements set forth in 662.2.7, and the refractor holder shall be hinged to the housing and secured by stainless steel latches and safety chain. The reflector shall be anodized finished polished aluminum. The socket shall be an adjustable porcelain mogul-base type with lamp grip. The ballast shall meet the requirement set forth in 662.2.7.2.

The luminaire shall be manufactured by Guth, General Electric, Holophane or shall be approved equal. The luminaire shall be designed to accommodate the appropriate lamp as called for on the Plans and listed in 662.2.9.

662.2.9-Lamps: The high pressure sodium lamps shall be as manufactured by General Electric, Crouse-Hinds, Hollophane or approved equal. Any lamp shall be of the manufacturer's latest specification and shall meet the following minimum characteristics:

For the following chart: Life = minimum rated life hours; Initial Lumens = minimum initial lumens in horizontal position; Relamping Factor = estimated lamp lumen depreciation at the end of relamping period.

TYPE/WATTS	LIFE-HOURS	INITIAL LUMENS	RELAMPING FACTOR
H.P.S./50-clear	24,000	4,000	0.73
H.P.S./70-clear	24,000	5,800	0.73
H.P.S./100-clear	24,000	9,500	0.73
H.P.S./150-clear	24,000	16,000	0.73
H.P.S./250-clear	24,000	30,000	0.73
H.P.S./400-clear	24,000	50,000	0.73
H.P.S./1000-clear	24,000	140,000	0.73

662.2.10

662.2.10-Wire and Cable: All wire and cable for feeder and branch circuits shall conform to the requirements of the current edition of the National Electric Code and shall meet all relevant ASTM Specifications. Conductors shall be coated softdrawn copper, unless otherwise noted on the Plans or in these Specifications. Insulation shall be type THWN or XHHW. Cable shall be UL approved.

Conductor sizes shall be standard American Wire Gauge sizes and shall be as noted on the Plans. All conductors shall be stranded. Stranded wire shall have a minimum of 19 strands.

The 15 KV wire and cable shall be single conductor G.E. Catalog # S1-58224, Anaconda AP-15315, Hatfield, Okonite, or approved equal. This cable shall have an approved stress cone at the terminating point.

All wire and cable shall have the size, voltage rating, type of insulation and manufacturer's name permanently marked on the outer covering at regular intervals. The manufacturer shall furnish to the Engineer and the Contractor all splicing or terminating information necessary for proper installation of the cable.

Color coding for the roadway lighting cables shall be permanent solid color as follows:

Single Phase		Three Phase	
Leg A	Black	Phase A	Black
Leg B	Red	Phase B	Red
Neutral	White or Gray	Phase C	Blue
Equipment Ground	Green	Equipment Ground	Green

Color coding of electrical conductors by use of phase tape or field paint is not acceptable. Conductors shall be manufacturer-colored, striped or ridge-marked.

Bare ground conductors shall be softdrawn copper.

662.2.10.1-Connectors: Cable connections in lighting support bases (except for Type IV and Type X) shall be made by means of connector kits, fused or nonfused, as indicated on the Plans. Underpass luminaires will be fused individually in the nearest accessible junction box.

Fused "Y" connectors shall be composed of a "Y" line side housing assembled with a load side and fuse terminal housing. The housings shall be formed from water-resistant synthetic rubber. Each housing shall provide a watertight seal around the cables and when fully assembled, shall form a watertight assembly. The cable size shall determine the connector size. Fuses shall be sized in accordance with nominally rated loads.

The line side housing shall contain a wye-tap having crimp or screwlug

type connectors for the line wires and spring-loaded fuse contacts. The assembly shall have 90 percent minimum conductivity.

The load side housing shall contain a crimp-type connector for the load wire and spring loaded fused contacts. The assembly shall have 90 percent minimum conductivity.

When a load-side wire is pulled or jerked, the load-side housing and assembly, including the fuse and any protruding contacts, shall separate from the line-side housing and assembly, leaving no exposed contacts in the line-side housing.

All wire to wire connections shall be made by the use of connector kits. Unfused connectors shall be used on all neutral wire. All wire to wire connections must be made in accessible locations with workable wire slack as required. Accessible locations include manholes, junction boxes and bases.

662.2.10.1.1-Splices: In special cases, such as conductor sizes in excess of #1/0 AWG and with written approval of the Engineer, wire splicing may be permitted. As with connector kits, splicing shall be done only in accessible, workable areas. Electrical splicing, when approved, shall be used at specific locations only and the number of splices shall be kept at a minimum.

When connector kits are not used, the following splicing method shall be used. Splices on all wire and in all boxes shall be made mechanically and electrically secure by means of an approved split bolt connector only. It shall then be wrapped with layers of insulating tape and in opposite directions. Over the insulating tape, two layers of friction tape shall be applied, followed by several layers of jacket tape, two final layers of friction tape and two coats of an electrical waterproofing paint. The insulating tape shall be wrapped to a wall thickness equal to 12 times the wall thickness of the cable insulation. Similarly, the jacket tape shall be wrapped to a thickness equal to 12 times the thickness of the cable jacket.

662.2.10.2-Aerial Cable: Aerial cable shall be either aluminum NSD or lashed galvanized messenger construction. Cable assembly shall be self-supporting.

662.2.10.2.1-Conductors: Insulated conductors shall conform to the requirements noted in 662.2.10. Insulation shall be XLP.

662.2.10.2.2-Messenger Cable: Messenger for the aluminum N-SD cable shall be bare, stranded, steel reinforced aluminum.

Messenger for the lashed galvanized cable shall be extra high strength galvanized steel wire with a breaking strength of not less than 11,000lb (49 kN). Lashing shall be stainless steel, ANSI 300 series.

662.2.11-Cable-in-Duct:

662.2.11

662.2.11.1-Description: The work under this item covers the installation of a system as described in the Plans and Special Provisions suitable for an installation buried directly in the earth.

662.2.11.2-Materials and Testing: The materials furnished and the testing necessary shall be as prescribed in the Plans.

662.2.12-Service and Control Stations:

662.2.12.1-General: The Contractor shall furnish and install service and control stations as noted on the Plans to serve the roadway lighting circuits. Service and control stations shall consist of cabinet (enclosure), all-weather padlock, control panel, conduit, cable, rock and earth excavation, backfill, concrete and steel reinforcement for the equipment pad, fencing and gate, transformer, grounding and all other incidentals for a complete and operable system as called for on the Plans.

Cabinets, electrical equipment, grounding and miscellaneous items shall conform to size, rating and description shown on the Plans and applicable NEMA and ANSI Standards as well as the usual practices of the local utility company and the National Electrical Code. Conductors shall be neatly arranged in a workmanlike manner and laced with nylon cable straps.

Cabinets (enclosures) shall be provided with nameplates and a wiring diagram of the circuits installed within the service and control station, sealed with a plastic cover and permanently attached to the inside of the door under a metal frame at a height of not less than one-half the door height.

Photoelectric controllers shall be the twistlock type, 120 volt, preset to "turn on" between 1.0 and 3.5 footcandles. "Turn off" shall be at least two times the "turn on" level; however, "turn off" must be greater than 3.0 and less than 15.0 footcandles. The unit shall meet all relevant NEMA Standards and shall be north oriented.

Transformers shall be built in accordance with the latest revision of the ANSI-NEMA standards for outdoor type distribution transformers, as manufactured by G.E., Westinghouse or shall be approved equal.

Two prints of shop drawings indicating the proposed dimensions and material specifications for the control center, cabinet (enclosure), and transformer, if required, shall be submitted for approval purposes within three weeks after the award of the Contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved" or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Resubmission of drawings to obtain final approval by the Division shall not be considered as being just cause for delay in completion of any contract.

662.2.12.2-Ground Mounted Cabinets: The entire assembly shall meet the requirements of NEMA Type 4 Standards.

Framed overlapping doors shall be installed in the front of each cabinet for

access to the panel interior, and they shall be hung on a substantial set of stainless steel hinges. The doors shall be provided with three-point and two-point, vault-type latch and padlock lugs. The cover joints shall have returned lips and shall be provided with gaskets which shall prevent water from entering the panels. A rain shield shall be provided over the doors.

Mounting plates and channels shall be provided within the cabinet for installing contractors, panelboards, auxiliary transformers, etc. The wiring shall be neatly arranged, laced and securely fastened in an approved manner.

Chain link fences shall conform to the requirements of 712.8 of the Specifications and shall contain at least four signs (one per center of each of the four sides) with the legend 'DANGER-HIGH VOLTAGE.'

Rock and earth excavation shall be in accordance with 207 of the Specifications, as revised and amended.

Adequate stainless steel screens and louvers shall be provided for the ventilation of internal equipment.

662.2.12.3-Pole Mounted Cabinets: The lighting circuit protector and disconnect switch shall have a NEMA Type 4 enclosure with operator capable of being locked in either position. Disconnect switch and fuse, or circuit breaker shall be rated and furnished with fuse or breaker size as shown on the Plans.

The framework steel and hardware used in the cabinet shall be stainless steel.

662.2.12.4-Service Poles: Service points shown on the Plans are approximate only. Final location of service poles shall be determined in the field. Materials and costs for the connections to the service point will be paid for by the Contractor. The Contractor shall conform to utility company requirements for this item. The service pole grounding system shall be installed as part of the pole in accordance with the requirements of the local power company.

All wiring on the poles shall be installed in steel conduits of sizes as shown on the Plans and shall be securely fastened to the service pole with pipe straps at not over four-foot (1.2 m) maximum spacing. All pole line hardware used in the service poles and control stations shall be hot-dipped galvanized.

662.2.13-Lighting Supports:

662.2.13.1-Lighting Pole Type I, II and III-Steel:

662.2.13.1.1-General Description: Each Lighting Pole, Type I, II and III shall consist of a pole shaft, removable pole top, luminaire support arm, base, support base (if required), anchor bolts, removable anchor bolt covers and any other accessories or hardware as required to make a complete installation as called for on the Plans or as directed by the Engineer. Spreads and mounting

662.2.13

heights shall be as detailed on the Plans; tolerance for mounting heights shall be plus or minus 6 inches (150 mm). All wiring shall be concealed within the pole shaft and luminaire support arm.

Lighting Poles Type I, II and III shall be certified to equal or exceed the requirements of AASHTO "Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals", based on at least 80 mph (129 km/hr) wind loads, a luminaire weight of 70 lb. (31.7 kg) and a luminaire projected area of 3.0 sq. feet (0.279).

The maximum allowable pole deflection from vertical at the top of the pole, due to the weight of the arm and luminaire, shall be two percent of the total shaft length. The pole deflection from vertical is defined as the horizontal distance between the pole top centerline when the pole alone is installed plumb and the pole top centerline after the arm and luminaire combination is installed on the previously plumb pole, the measurement to be made without additional shaft adjustment. The fabricator shall certify to the above and maintain results of computations or tests to document compliance, for each type of lighting pole supplied.

662.2.13.1.2-Pole Shaft: The pole shaft shall be an ASTM A 595 Grade A Tube or fabricated from weldable grade, hot-rolled, commercial quality steel, meeting the requirements of ASTM A 607, with a minimum yield strength of 55,000 psi (380 MPa) after fabrication. The round shaft shall be fabricated in one piece from not less than # 11 manufacturer's standard gauge steel and be continuously tapered at 0.14 or 0.10 in. per ft. (3.04 mm/m). Two piece shafts, that assemble by telescoping the upper section over the lower section with a firm tapered fit, may be used for 40, 45, 50, 55 and 60 ft. (11.7 or 8.33 mm per meter) mounting heights. Each pole shaft shall include a J-hook wire support welded inside near the top, a handhole with cover as noted on the plans (except for transformer bases), and a ground connector near the bottom. An opening shall be provided near the top of the shaft to provide a cable entrance from the shaft into the luminaire support arm.

662.2.13.1.3-Luminaire Support Arm Types I and II: Luminaire support arms for Lighting Poles Types I and II shall be of constant diameter and fabricated from 2 in. pipe, having a wall thickness equal to Schedule 40 pipe and meeting the requirements of ASTM A 501, or from 2-3/8 in. steel tubular members with a nominal wall thickness equal to Schedule 40 pipe and having a minimum yield strength equal to ASTM A36. For arm spreads 12 ft. (3.6 m) and less, the fabrication of the lower member may be of 1½ in pipe, having a wall thickness equal to Schedule 40 pipe. For arm spreads over 18 ft. (5.5 m), the fabrication may be of 2½ in. pipe, having a wall thickness equal to Schedule 40 pipe, or a combination of 2½ in. and 2 in. meeting the above requirements. The arm shall be attached to the pole so that it can transfer the full strength of the arm to the pole shaft.

The truss type arm (Type I) shall consist of an upper and lower member joined near the luminaire end of the arm and securely joined with vertical

strut(s). The upper member shall be continuous and the wiring member. The vertical strut(s) shall be either oval, circular, rectangular or square in cross section and shall be made of steel meeting the physical requirements of ASTM A 36.

A 2 in. (50 mm) slip fitting arrangement shall be provided at the tip of all arms.

662.2.13.1.4-Luminaire Support Arm Type III: Luminaire support arms for Lighting Pole Type III shall be an ASTM A 595 Grade A Tube or fabricated from weldable grade, hot rolled, commercial quality steel, meeting the requirements of ASTM A 607, with a minimum yield strength of 55,000 psi (380 MPa) after fabrication. The arm shall be cylindrical in cross section and uniformly tapered from butt to tip at 0.14 or 0.10 in. per foot (11.67 or 8.33 mm per meter). The arm shall be fabricated in one piece from not less than # 11 (3.04 mm) manufacturer's standard gage steel. The arm shall be attached to the pole so that it can transfer the full strength of the arm to the pole shaft.

Two-piece arms may be used for spreads greater than 34 feet (10.4 m). The outside luminaire support arm shall be a round tapered tubular member fabricated from material with a minimum yield strength of 36,000 psi (10.4 m) after fabrication. Two-piece arms shall assemble by a telescoping joint. The telescoping length of the joint shall not be less than 1½ times the diameter of the arm at the joint. The telescoping field joint shall not be welded but shall be keyed with a through bolt.

A 2 in. (50 mm) slip fitting arrangement shall be provided at the tip of all arms.

662.2.13.1.5-Bases: Anchor, support and approved breakaway bases shall be constructed of sufficient size and strength to fully develop the bending moment of the shaft. Each base shall be provided with four holes (slip base may have three) of sufficient size to accommodate the proper size anchor bolts to resist at yield stress, the bending moment of the shaft at its yield stress. All bases, except the transformer type, shall have the handhole centered approximately 18 in. (450 mm) above the bottom of the shaft located downstream of oncoming traffic.

Anchor bases shall be one-piece fabricated from material meeting ASTM A 27 Grade 65-35 or ASTM A 36 of sufficient cross section to fully develop the ultimate strength of the pole. Galvanizing shall be in accordance with ASTM A 123.

Breakaway bases (e.g. aluminum transformer, cast aluminum, fluted aluminum breakaway couplings, slip, etc.), if required, shall meet the dimensions and requirements as required by the Plans. All breakaway bases shall be certified for conformance to the AASHTO breakaway performance criteria.

The aluminum transformer bases shall be nominally 20 in. (500 mm) high with an access door secured in place by stainless steel locking screws. All

662.2.13

bearing plates shall be hot-dipped galvanized in accordance with ASTM A 123. Washers shall be hot-dipped galvanized in accordance with ASTM A 153. A tapped hole shall be provided for grounding. **When aluminum transformer bases are used with steel anchor base poles, both the bottom of the steel anchor base and the top of the aluminum transformer base shall be coated or painted with a heavy film of zinc-rich paint.**

662.2.13.1.6-Anchor Bolts: Anchor bolts shall be of sufficient size and strength to fully develop the bending moment of the shaft. **Anchor bolts (unless otherwise directed on the Plans) shall be fabricated from ASTM A1444 Gr. 55.** Each bolt shall have the thread end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Each bolt shall be provided with a regular hex nut or heavy hex nut (anchor bases to have two hex nuts) that shall be hot dipped galvanized. Hex nuts shall be regular meeting ASTM A 563 Grade A for ¼ in.- 1½ in. (6 through 38 mm) sizes and shall be heavy hex for sizes over 1½ in. to 4 inches (38 to 102 mm).

662.2.13.1.7-Galvanizing: The pole shaft, luminaire support arm, pole top, handhole cover, anchor base and slip base shall be galvanized in accordance with ASTM A 123. Galvanized coatings damaged for any reason shall be repaired by the application of a zinc rich paint conforming with [711.21](#) of the Specifications. The places to be painted shall be thoroughly cleaned before the paint is applied.

662.2.13.1.8-Marking: Each pole shall be identified by control station number (as applicable), circuit number (as applicable), wattage and pole number with adhesive labels applied 6 feet (1.8 m) above the grade line normal to the roadway. Adhesive labels shall be designed to be exposed to the weather. Legend shall be 3 inches (75 mm) black on white.

662.2.13.1.9-Drawings for Approval Purposes: Two prints of shop drawings indicating the proposed dimensions and material specifications for each of the components involved shall be submitted by the Contractor for approval purposes within three weeks after the award of Contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved" or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved.

Resubmission of drawings to obtain final approval by the Division shall not be considered as being just cause for delay in the completion of any contract.

662.2.13.1.10-Mill Test Reports and Certification: Mill test reports or certifications of conformance to specifications for materials and design will be required for all materials incorporated into the work. The following shall be supplied by the Contractor prior to acceptance of the structures:

- i. Mill Test Reports (M.T.R.) for MAJOR structural items only, as noted in the following chart, shall include both physical and chemical descriptions of the material as supplied to the fabricator. When physical properties are altered during fabrication, the M.T.R. covering chemical composition will be supplemented by certified test reports indicating the physical properties of this material after fabrication.
- ii. Certification of Conformance to the Specifications for all remaining material not covered by M.T.R. as noted in the following chart.
- iii. Certification that all welding was performed by operators qualified as follows: steel welders to AWS and aluminum welders to ASME.
- iv. Certification of Conformance to the Specifications for the Design of all components not completely dimensioned and detailed on the Standard Drawing.

TABLE 662.2.13.1.10		
COMPONENT MATERIALS	M.T.R.	CERTIFICATIONS
Tubes for arms and poles	X	
Base castings	X	
Anchor bolts	X	
Pole tops, misc. fittings and hardware		X
Fabricated or cast-type arm connections	X

Welding Rod	X	

662.2.13.2-Lighting Pole Type IV-Wood:

662.2.13.2.1-General Description: Each Type IV Wood Pole shall consist of an upright shaft fitted with necessary hardware to make the installation complete as detailed on the contract Plans.

All wood poles shall meet the requirements of Section [710.8](#).

662.2.13.2.2-Luminaire Support Arms: Luminaire support arms for Type IV Lighting Poles shall be of constant diameter and fabricated from 2 in. pipe, having a wall thickness equal to Schedule 40 pipe and meeting the

662.2.13

requirements of ASTM A 501, or from 2-3/8 inch OD steel tubular members with a nominal wall thickness equal to Schedule 40 pipe and having a minimum yield strength equal to ASTM A 36. For arm spreads over 18 ft. (5.5 m), the fabrication may be of 2 1/2 in. pipe having a wall thickness equal to Schedule 40 pipe, or a combination of 2 1/2 in. and 2 in., meeting the above requirements.

The method of attachment to the pole shall be that as suggested by the support arm manufacturer and approved by the Engineer.

A 2-in. (50 mm) slip fitting arrangement shall be provided at the tip of all arms.

662.2.13.3-Lighting Pole Type V and VII-Aluminum :

662.2.13.3.1-General Description: Each Lighting Pole Type V "Luminaire Support Arm Mounted" shall consist of a pole shaft, removable pole top, luminaire support arm, base, support base (if required), anchor bolts, removable anchor bolt covers and any other accessories or hardware as required to make a complete installation as called for on the Plans or as directed by the Engineer. Each Lighting Pole Type VII "Luminaire Post Top Mounted" shall consist of a pole shaft, base, anchor bolts, removable anchor bolt covers and any other accessories or hardware as required to make a complete installation as called for on the Plans or as directed by the Engineer. Spreads and mounting heights shall be as detailed on the Plans; tolerance for mounting heights shall be plus or minus 6 inches (150 mm). All wiring shall be concealed within the pole shaft and luminaire support arm.

Lighting Poles Type V and VII shall be certified to be equal or exceed the requirements of AASHTO "Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals". Type V shall be based on at least 80 mph (129 km/hr) wind loads, a luminaire weight of 70 lb. (31.7 kg) and a luminaire projected area of 3.0 sq. feet (0.279 sq. m). Type VII shall be based on 80 mph (129 km/hr), ignore the weight and 2.5 sq. feet (0.232 sq. m).

The maximum allowable pole deflection from vertical at the top of the pole, due to the weight of the arm and luminaire, shall be two percent of the total shaft length. The pole deflection from vertical is defined as the horizontal distance between the pole top centerline after the arm and luminaire combination is installed on the previously plumb pole, and measurement to be made without additional shaft adjustment. The fabricator must certify to the above and maintain results of computations or tests to document compliance for each type of lighting pole supplied.

662.2.13.3.2-Pole Shaft: The pole shaft shall be one-piece, cylindrical, tapered seamless (or one continuous longitudinal weld) tubing which shall have mechanical properties not less than that listed for ASTM B221, B429, B241, or B209 after fabrication. Two-piece shafts, that assemble by telescoping the upper section over the lower section with a firm tapered fit, maybe used for 40, 45 and 50 ft. (12.13, 13.72 and 15.24 meter) mounting heights. Each pole shaft shall have a J-hook wire support inside near the top, a handhole with cover as

noted on the Plans (except for transformer bases) and a ground connector near the bottom. Minimum wall thickness (unless otherwise approved by the Engineer) shall be 0.188 in. (4.775 mm) for Type V poles and 0.125 in. (3.175 mm) for Type VII poles. The top of shaft OD for "Luminaire Post Top Mounted" shall be 3 inches (75 mm) unless otherwise approved by the Engineer.

662.2.13.3.3-Luminaire Support Arm: The luminaire support arm shall be aluminum pipe or tapered aluminum tubing made from ASTM B221, B429, B241, or B209 which shall have mechanical properties not less than that listed for ASTM B221, B429, B241, or B209 after fabrication. A 2-in.(50 mm) slip fitting arrangement shall be provided at the tip of all arms.

662.2.13.3.4-Bases: Anchor, support and approved breakaway bases shall be constructed of sufficient size and strength to fully develop the bending moment of the shaft. Each base shall be provided with four holes (three if approved by the Engineer) of sufficient size to accommodate the proper size anchor bolts to resist at yield stress, the bending moment of the shaft at its yield stress. All bases, except the transformer type, shall have a handhole centered approximately 18 in. (450 mm) above the bottom of the shaft located downstream of oncoming traffic.

Anchor bases shall be made from Alloy ASTM B108 as detailed on the Plans or as directed by the Engineer. Support bases shall be fabricated from steel conforming to ASTM A 36, with galvanizing in accordance with ASTM A 123. Aluminum transformer bases shall meet the requirements as identified in the fourth paragraph of 662.2.13.1.5.

Breakaway bases (e.g. aluminum transformer, cast aluminum, fluted aluminum breakaway couplings, slip etc.), if required, shall meet the dimensions and requirements as required by the Plans. All breakaway bases shall be certified for conformance to the latest AASHTO breakaway performance criteria.

662.2.13.3.5-Anchor Bolts: Anchor bolts shall be of sufficient size and strength to fully develop the bending moment of the shaft. **Anchor bolts (unless otherwise directed on the Plans) shall be fabricated from ASTM A1554 Gr. 55.** Each bolt shall have the threaded end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Each bolt shall be provided with a regular hex nut or heavy hex nut (anchor bases to have two hex nuts) that shall be hot dipped galvanized. Hex nuts shall be regular meeting ASTM A 563 Grade A for ¼ in. (6 mm) to 1½ in. (38 mm) sizes and shall be heavy hex for sizes over 1 ½ in. to 4 inches (38 to 102 mm).

662.2.13.3.6-Marking: Each pole shall be identified as required in 662.2.13.1.8.

662.2.13

662.2.13.3.7-Drawings for Approval Purposes: Shop Drawings shall be submitted, approved and applied as required in 662.2.13.1.9.

662.2.13.3.8-Mill Test Reports and Certification: Mill test reports or certifications of conformance to specifications for materials and design shall be supplied as required in 662.2.13.1.10.

662.2.13.4-Lighting Pole Type X-Steel High Mast:

662.2.13.4.1-General Description: Each Lighting Pole Type X shall consist of pole shaft, anchor base, anchor bolts and nuts, lowering devices and any other accessories or hardware as required to make a complete installation as called for on the Plans or as directed by the Engineer. Mounting heights, number and type of luminaires shall be as detailed on the Plans. Tolerance for mounting heights shall be plus or minus 12 inches (300 mm). Any manufacturer's warranties, expressed or implied, shall become the property of the Division.

A complete service manual including instruction on installation, operation and maintenance shall be furnished for each lowering device, winch assembly and power drive system furnished on each project.

Lighting Poles Type X shall be certified to be equal or exceed the requirements of AASHTO "Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals," based on the Final Deflected Pole Position Method and the following:

Wind Velocity	= 90 mph. (144.8 km/hr)
Number of Luminaires	= 8
Weight of Luminaires	= 70 lbs. Each (560 lbs. total) (31.8 kg each {254 kg total})
Area of Luminaires	= 2.8 sq. ft. Each (22.4 sq. ft. total) (0.26 sq. meter each (2.081 sq. meters total))
Weight of Mounting Head	= 370 lb. (167.8 kg)
Area of Mounting Head	= 3.5 sq. ft. (0.325 sq. meter)

662.2.13.4.2-Pole Shaft: The pole shaft shall be made from one to six continuously tapered circular or twelve sided sections which shall either telescope with each other or be shop butt welded by electric arc welding. Steel used in fabricating the shaft shall be either galvanized steel (hot-dipped according to ASTM A 123) or weathering steel with a minimum yield strength of 55,000 psi (380 MPa) after fabrication and shall have one or two

longitudinal welds. Materials shall be galvanized steel unless otherwise indicated on the Plans as weathering steel. All poles on any one project shall be of the same type construction for pieces and sections. Straightness tolerance shall be ½ inch in 20 feet (2.08 mm per meter). The inside surface of the shaft shall be relatively smooth to provide a cable raceway. Projections on the inside of the pole (such as backup rings) shall not exceed ⅜ in. (9.5 mm) projection in the area between the handhole and the top flange.

Minor sections of galvanized coatings (of pole shaft, pole support assembly and circular luminaire ring assembly) damaged for any reason shall be repaired by the application of a zinc rich paint conforming with 711.21 of the Standard Specifications. The places to be painted shall be thoroughly cleaned before the paint is applied.

The lap joint produced by telescoping shall have a minimum length of one and one-half diameters of the shaft at the joint measured at the minimum diameter of the inner telescoping section. No transverse welding shall be permitted to secure the overlapping telescoping joints. Overlap areas on weathering steel poles shall be shop painted in accordance with 688. The outside of the lower pole shall be coated so a minimum of 1 in. (25 mm) below the bottom edge of the upper pole is covered (after erection). The inside of the upper pole shall be coated so a minimum of 6 inches (150 mm) above the top edge of the lower pole is covered (after erection). In addition the intersection of each overlap joint on the outside shall be sealed with a commercial silicone building sealant such as Dow Corning 795. The numbering shall be applied in such fashion that the marks shall be unobtrusive after assembly.

In the bottom section of the shaft shall be an access door with stainless steel hinged door, neoprene door gasket and hasp (welded inside to the reinforcing frame, sleeve or plate) with an all weather padlock. The door shall be sufficient size to allow the internal machinery (winch and gear box) to be disconnected from its mountings and removed through the door. An additional handhole may be provided for wiring access. All handholes or openings in the shaft shall be properly designed and fabricated to avoid stress risers by use of an internal reinforcing sleeve or a reinforcing frame with full penetration welds or other approved method.

Each pole shall be identified by control station number (as applicable), circuit number (as applicable), wattage and pole number with adhesive labels applied 8 feet (2.4 m) above the base plate normal to the nearest roadway. Adhesive labels shall be designed to be exposed to the weather. This legend shall be 5 inches (125 mm) black on white.

662.2.13.4.3-Anchor Base: The anchor base (cast or rolled steel) shall be constructed of ASTM A 36 minimum for galvanized steel or ASTM A 588 for weathering steel and shall be of sufficient size and strength to fully develop the bending moment of the shaft. It shall be welded to the shaft by a full penetration weld. The weld must be made with a backup ring, or other approved procedure, or be welded from both sides.

662.2.13.4.4-Anchor Bolts: Anchor bolts shall be of sufficient size and strength to fully develop the bending moment of the shaft. Anchor bolts shall be fabricated from ASTM A1554 Gr.55. Each bolt shall have the threaded end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Each bolt shall be provided with two heavy hex nuts and two heavy washers. Both nuts and washers shall be hotdipped galvanized. Detailed properties, dimensions, bolt circles and appropriate backup calculations for anchor bolts for each type pole supplied shall be submitted to and approved by the Division before fabrication.

662.2.13.4.5-Miscellaneous Hardware: Miscellaneous other hardware not covered by other specifications shall as a minimum comply with the following:

Galvanized steel structures:

Miscellaneous plates, bars and structural shapes shall be ASTM A 36. Pipe shall be ASTM A 501.

Weathering steel Structures:

Miscellaneous plates, bars and structural shapes shall be ASTM A 588. Pipe shall be Yolo high strength, low alloy steel or approved equal.

662.2.13.4.6-Welding: All welding shall conform to AASHTO "Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals", Section 1.4.2(A) through (D). Welding must be certified to performance by operators qualified as follows: Steel welders to AWS and aluminum welders to ASME. Longitudinal joints in the tapered sections of the pole shaft shall be made only by automatic electric arc welding. Transverse butt-welds may be used, but only under closely controlled shop conditions. Winch mount plate and emergency stop ring welds shall be fillet welds.

All welds in the shaft shall be tested and certified by close visual inspection or approved alternate methods (such as ultrasonic or magnetic particle). One hundred percent of the full penetration sections of longitudinal seam welds shall be radiographically inspected and a random ten percent of the partial penetration section of the longitudinal seam welds shall be inspected by the magnetic particle method.

662.2.13.4.7-Lowering Devices:

662.2.13.4.7.1-General Description: The integral luminaire lowering mechanism or devices shall be compatible with the pole design and shall consist of a head frame assembly, a luminaire ring assembly and a hoisting assembly. The system shall permit luminaire maintenance at ground level, provide for disconnection of the electrical service at the pole base, provide a convenient means of energizing the lighting assembly when it is at ground level, support eight 70 lb. (31.75 kg) luminaires in a symmetrical arrangement and include

power cables and all miscellaneous electrical equipment in the pole necessary to provide a complete and workable device. All bolts and machine screws shall be secured in a manner that will preclude their becoming loosened by vibration. Star washers, jam nuts, self-locking nuts, locktite, etc., may be used to secure nuts and machine screws. Sheave pins shall be secured by means of washers and cotter keys or pins, not welded.

662.2.13.4.7.2-Head Frame Assembly: The head frame structure shall be galvanized steel, attached to the pole by a steel slipfitter and secured by the appropriate stainless steel setscrews. It shall consist of all necessary pulleys and rollers to guide the hoisting cables and electrical cable. The head frame shall support six, 6 in. (142.4 mm) diameter steel hoist cable sheaves or six, 5 in. (127.0 mm) diameter cast aluminum hoist cable sheaves with oil-impregnated, sintered bronze bushing with stainless steel shafts. The three hoisting cables shall be stainless steel 7 x 19 aircraft cord of 3/16 in. (4.7625 mm) diameter. The minimum tread diameter for the hoisting cable sheaves shall be 20 times the cable diameter for galvanized cable and 25 times the cable diameter for stainless steel cable. The hoisting cable sheave groove cross-section shall be semicircular with a radius of one-half the cable diameter plus 1/64 inch (396 µm).

The power cable shall not be bent at a radius less than five times the cable diameter and the groove cross-section shall prevent the cable from rolling out of the groove if the cable is twisting. All power cable sheaves and rollers shall be suspended on stainless steel shafts fitted with self-lubricating bushings or be fabricated of self-lubricating material.

All head frame sheaves will have keepers to keep cables engaged during operation.

The head frame assembly shall be protected from the weather by an aluminum cover.

Positive latching devices shall be incorporated into the luminaire ring assembly. These devices shall be designed to prevent any movement of the luminaire ring assembly when it is latched to the top of the pole and tension is removed from the luminaire ring support cables. Latching shall be accomplished by the alternate raising and lowering of the luminaire ring assembly by the winch and hoisting assembly and there shall be no moving latch parts or springs attached to the head frame assembly. Reflectors or flags shall be provided to indicate when the luminaire ring assembly is completely and securely latched to the head frame assembly. All moving parts of the latching mechanism shall be attached to the luminaire ring assembly and serviceable from the ground.

662.2.13.4.7.3-Luminaire Ring Assembly: The luminaire ring shall be fabricated of 6 in. (150 mm) steel channel, hot dipped galvanized with the appropriate number of 2 in. (50 mm) nominal galvanized steel pipe mounting arms. The luminaire ring shall be wired with Type S.O. power cable or

662.2.13

equivalent and Type ST distribution cable with insulation suitable for at least 105 C.

All electrical cords shall be attached to the weathertight wiring chamber through weathertight cable connections. A prewired 600 volt terminal block and a secondary lightning arrester shall be provided in the weathertight chamber. A weathertight twistlock power inlet shall be provided on the chamber to allow testing of the luminaires while in the lower position.

Roller-contact, spring-loaded centering arms shall be provided to stabilize and center the luminaire ring during raising or lowering operations and to eliminate shock to the lamps from impact of the luminaire ring with the pole.

The rollers for the centering arms shall be of a water-resistant, non-marking material with oil-impregnated sintered bronze bushings. All axle shafts for arms and rollers shall be stainless steel.

662.2.13.4.7.4-Housing Assembly (Winch Assembly): The winch shall have an ultimate strength of five times the lifted load with the number of layers of cable with which it will be used. The winch shall have a 30 to 1 worm gear reduction ratio and include an integral drag brake on the worm shaft to prevent free spooling of the winch. The winch shall be designed for at least intermittent power operation, but also have hand crank capability.

The winch shall be prewound with galvanized steel ¼ inch (6.35 mm), 7 x 19 aircraft cord of sufficient length to maintain at least four complete wraps on the drum after the device has been lowered to its lowest position. The drum shall be supported at both ends and keepers shall be provided to ensure that uncoiled cable will rewrap onto the drum.

A portable power unit is required (one per project). Its motor shall be the heavy-duty reversing type with a stalling torque at least twice that required to operate the device. The motor shall drive the winch through the torque limiter coupling to limit the lifting force. The hoisting rate shall be between 12 and 25 feet (3.6 and 7.5 m) per minute. The motor shall be controlled by a reversing switch connected by a 20 foot (6.1 m) remote cord. The portable power unit shall be provided with a portable enclosed and encapsulated transformer to stepdown the parent voltage to 120 volts to operate the power unit. All electrical connections from the transformer to the power cord and from the transformer to the power unit shall be twistlock caps and plugs.

662.2.13.4.8-Wire Rope:

662.13.4.8.1-Materials for the stainless steel cables shall conform to the Chemistry of ASTM A492 type 302 or 304.

The wire used in steel cable shall be cylindrical and smooth and of uniform high quality. The finished cable shall be uniform in construction and securely laid, free from kinks, loose wires, loose strands, splits, cold shuts or other defects. A suitable type of friction-preventive compound having noncorrosive properties shall be impregnated into the wire rope. The individual wires and strands composing the wire rope shall be shaped into the exact helical position they will have in the finished wire rope, so that if the wire rope is cut or severed

there is no tendency for the measured diameter of the wire rope at the unseized cut ends to increase by more than the amount specified in Table 662.2.13.4.8.

TABLE 662.2.13.4.8 {ENGLISH} CONSTRUCTION, PHYSICAL PROPERTIES OF STAINLESS STEEL WIRE ROPE				
Nominal Diameter of Wire Rope (Inches)	Tolerance on Diameter (Plus Only) (Inches)	Allowable Increase of Diameter (Inches)	Nominal Break Strength Stainless Steel (Pounds)	Approximate Weight per 100 ft. (Pounds)
5/32	.016	.017	2,400	4.50
3/16	.018	.019	3,700	6.50
7/32	.018	.020	5,000	8.60
1/4	.018	.021	6,400	11.00
5/16	.022	.024	9,000	17.30
3/8	.026	.027	12,000	24.30

TABLE 662.2.13.4.8 {METRIC} CONSTRUCTION, PHYSICAL PROPERTIES OF STAINLESS STEEL WIRE ROPE				
Nominal Diameter of Wire Rope (millimeters)	Tolerance on Diameter (Plus Only) (millimeters)	Allowable Increase of Diameter (millimeters)	Nominal Break Strength Stainless Steel (kilograms)	Approximate Weight per 30.48 meters (kilograms)
3.96	0.4064	0.4318	1090	0.16
4.762	0.4572	0.4826	1680	0.90
5.556	0.4572	0.5080	2270	1.19
6.350	0.4572	0.5334	2900	1.52
7.935	0.5588	0.6096	4080	2.39
9.525	0.6604	0.6858	5445	3.36

Flexible steel wire rope covered by this specification shall be of 7 x 19 construction. The type of construction for the respective diameters, the dimensional tolerances and the physical properties shall be as specified in Table 662.2.13.4.8. Wire rope shall be 7x19 aircraft cable.

662.2.13

662.2.13.4.8.2-Quality conformance testing shall consist of all the inspections such as workmanship and physical appearance previously specified. The sample wire rope shall pass the breaking strength test and stretch tests as specified below.

- i. Sampling-When conducting the tests, one sample shall be taken after any discard has been removed from the head or starting end of the first manufacturing reel for each lot of wire rope.
- ii. Lot-A lot shall consist of not more than 20,000 ft. (6 100 meters) of wire rope of the same construction and diameter produced continuously by one machine or by one series of progressive processing machines.

662.2.13.4.8.3-Breaking Strength: The wire rope specimen shall be selected from the sample from each lot. The specimen shall be no less than 24 inches (600 mm) in length, and where necessary, swaged terminals conforming to MIL-T-781 (do not use ball end fitting) and accompanying hardware may be used to facilitate installation of the specimen in the jaws of the testing machine. The distance between the jaws of the testing machine with the sample shall be no less than 10 inches (250 mm). The breaking strength shall be determined by use of a tensile testing machine in accordance with applicable requirements of ASTM E 8. The breaking strength shall conform to the requirements of Table 662.2.13.4.8 for qualification.

662.2.13.4.8.4-Stretch Test: One specimen from each sample of wire rope selected as specified in 662.2.13.4.8.2 shall be tested to determine the percent stretch. The total length of the wire rope specimen to be tested shall not be less than 24 inches (600 mm). Where necessary, swaged terminals and accompanying hardware may be used to facilitate installation of the specimen in the jaws of the test machine. The amount of stretch shall be determined on a tension testing machine in accordance with ASTM E 8. The specimen shall be loaded to one percent nominal breaking strength shown in Table 662.2.13.4.8 to straighten the wire rope. While the specimen is under tension, an adequate gauge length shall be marked off the wire rope between the jaws of the testing machine. The specimen shall then be loaded to 60 percent of minimum breaking strength and measured to elongation under load. From this data the stretch shall not exceed 1.5 percent.

662.2.13.4.8.5-Certification: Upon request, the wire rope manufacturer shall furnish a certified test report showing that the wire rope manufacturer's product satisfactorily conforms to this Specification. The test report shall include, as a minimum, actual results of the tests specified.

662.2.13.4.9-Drawings for Approval Purposes: Two prints of shop drawings indicating the proposed dimensions and material specifications for the poles and lowering devices shall be submitted by the Contractor for

approval purposes within three weeks after the award of the Contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved" or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved. Resubmission of drawings to obtain final approval by the Division shall not be considered as being just cause for delay in the completion of any contract.

662.2.13.4.10-Mill Test Reports and Certification: Mill test reports or certificates of conformance to specifications for materials and design will be required for all materials incorporated into the work. The following shall be supplied by the Contractor prior to acceptance of the structures:

- i. Mill Test Reports (M.T.R.) for MAJOR structural items only, as noted in the following chart, shall include both physical and chemical descriptions of the material as supplied to the fabricator. When physical properties are altered during fabrication, the M.T.R. covering chemical composition will be supplemented by certified test reports indicating the physical properties of this material after fabrication.
- ii. Certification of Conformance to the Specifications for all remaining material not covered by M.T.R. as noted in the following chart.
- iii. Certification of Conformance to the Specifications for the design of all components not completely dimensioned and detailed on the Standard drawing.

TABLE 662.2.13.4.10		
COMPONENT MATERIALS	M.T.R.	CERTIFICATIONS
Tubes for poles	X	
Base Castings	X	
Anchor bolts	X	
Pole tops, lowering devices, cable, misc., fittings, and hardware		X
Galvanizing		X
Welding Rod	X	

662.2.14

662.2.14-Navigation Lighting System: The Contractor shall furnish and install a navigation lighting system as indicated on the Plans. The navigation lighting system shall consist of control center, enclosure, power service, conduit, cable, junction boxes, navigation light unit, photoelectric unit, electrical work, electrical tests and all other incidentals for a complete and operable system as called for on the Plans.

662.2.14.1-General: The installation, equipment, materials and workmanship, except as specifically modified, shall be in accordance with applicable provisions of the following publications, codes and regulations in effect on the date of the invitation for bids:

National Electrical Code
American National Standards Institute
National Electrical Manufacturer's Association
Insulated Power Cable Engineers Association
U.S. Coast Guard Publication, "A Guide to Bridge Lighting"
Enclosure 6 to COMDTINST M16590.5
Federal Aviation Administration "Obstruction Marking and Lighting"
AC70/7460-IF
Regulations of local power company

In the event of conflict in any requirements of the above standards, the Engineer will determine which authority is applicable.

Two prints of shop drawings indicating the proposed dimensions and material specifications for the control center, enclosure, transformer, if required, and navigation light unit shall be submitted for approval purposes within three weeks after the award of the Contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved" or "Returned for Revisions as Noted". Eight sets of drawings shall then be submitted for final approval. Resubmission of drawings to obtain final approval by the Division shall not be considered as being just cause for delay in completion of any contract.

After the installation is completed, the Contractor shall conduct a continuous 24-hour operating test for approval. In addition, final acceptance of any installation will not occur until 30 days of operation termed satisfactory by the Engineer.

662.2.14.2-Navigation Lighting (Surface):

662.2.14.2.1-General: Navigation lights shall be securely mounted to the bridge structure or substructure and shall show through a horizontal arc of 360° for green lights and show through a horizontal arc of 180° for red lights as specified or detailed in the Plans. They shall be pivot-swivel mounted or pedestal mounted as specified. The pivot mounted lights shall have a locking mechanism and service-retrieving chain made of corrosion-resistant non-plastic

material.

The navigation lights shall have one or two lenses with one or two lamps as specified but unless otherwise noted, are to have one lens with one lamp.

The lamps shall be 100-W, 120-V, rated at 5-years. The lenses shall be fresnel glass eight in. (203 mm) (177 mm minimum I. D.). The signal housing shall be made of aluminum, silicon bronze or cast bronze and shall be watertight with weather-proof gaskets.

The hangar stem shall be 1½ in. (40 mm) minimum galvanized steel pipe or 1½ in. (40 mm) minimum stainless steel pipe. The mounting bracket and hangar housing shall be cast silicon bronze with stainless steel pivot and shall be watertight.

The cable shall be #16 S. O. minimum and all connections shall be watertight. Any other structural connections shall be watertight and of good quality non-corrosive construction.

The pedestal mounted light shall meet all of the aforementioned light, lamp, lense, signal housing, cable and structural connection requirements. The pedestal mounted stem itself shall be similar to and meet the requirement of the pivot mounted hangar stem requirements.

Navigation lights shall be provided with supports constructed of steel meeting ASTM A 36. Each fixture shall be individually protected by "in the line" fuses as manufactured by ESNA Corporation, Bussman Manufacturing Division of McGraw-Edison Company, HOMAC, or approved equal.

The photoelectric control for navigation lights shall provide automatic switching of circuits. The unit shall be oriented as nearly as possible to face the northern sky. Initial settings shall be 35 footcandles for "turn on" and 58 footcandles for "turn off". The unit shall be housed in a weatherproof enclosure of the twistlock type. The unit shall be "fail safe", i.e., failure of the electronic circuit will "turn on" the navigation lights. The unit shall be suitable for operation in three-wire, 120/240 Volt, 60 Hz. circuits.

662.2.14.2.2-Power Service: Power shall be received at a location noted on the Plans or as directed by the Engineer. Power will be 120/240 Volt single phase, 60 Hz., three-wire from the Power Company. Materials to be furnished and installed by the Contractor will be as designated on the Plans or as directed by the Engineer.

662.2.14.2.3-Cable: Cable shall be single conductor, stranded copper, 600 Volt, Type THW. Cable for the final connection to swivel mounted navigation lights shall be three or four conductor stranded copper, 600 V, Type S. O. Cable splicing will be permitted in junction boxes only.

CONSTRUCTION METHODS

662.3-GENERAL:

The Plans show, in general, the location of the roadway lighting systems

662.4

and other incidental work to be performed. They are diagrammatic only, but shall be followed as closely as actual site conditions will permit.

Any alternate design or significant departure from the Plans proposed by the Contractor must be prepared by the Contractor in written or plan form, or both, and presented in writing to the Division for approval. The Division will not approve substitution of material or design detail changes which constitute a reduction in quality, workmanship, or strength of the materials involved.

662.4-CONCRETE:

Concrete shall be mixed and placed in accordance with Section 601 of the Standard Specifications.

662.5-CONDUIT:

Conduits shall be of the size and type noted on the Plans. Conduit shall be installed at a minimum depth of 18 in. (450 mm) and at a distance of at least 6 inches (150 mm) from any utility line. Conduit runs shall be continuous in size from terminal point to terminal point. No reducing coupling will be permitted. All unused conduits shall be threaded and capped. Unused conduits terminating underground shall also be marked with a concrete marker.

The threads on all steel pipe conduit shall be painted with rust preventative paint meeting Military Specification MIL-P-21035 before couplings are made. All couplings shall be tightened until the ends of conduits are brought together. Conduits stubs, caps, exposed threads, or damaged galvanized areas shall be painted with rust preventive paint meeting Military Specification MIL-P-21035.

Expansion deflection fittings shall be installed in metallic conduit runs in bridge structures and in retaining walls at all expansion joints and all stringer (stress) relief joints and all other locations as specified on the Plans. These fittings shall be bonded with approved flexible tinned copper bonding jumpers.

Conduit shall be placed under existing pavement by approved jacking or drilling methods. Pavement shall not be disturbed without permission of the Engineer. In the event obstructions are encountered, upon approval of the Engineer, small test holes may be cut in the pavement to locate obstructions. Jacking or drilling pits shall be kept 2 feet (600 mm) clear of the edge of any type of pavement wherever possible. Water jetting will not be permitted.

PVC conduit shall be made water tight by joining with solvent as per the manufacturer's recommendations. Ends terminating in junction boxes shall be terminated with end bells. Ends joining to metal conduit elbows at foundations shall be connected through expansion couplings and adapters.

Approximate lengths of conduit are shown on the Plans. It is the responsibility of the Contractor to determine exact lengths of conduit runs in the field.

A number 12 AWG (minimum) galvanized pull wire shall be installed in all conduits which are to receive future conductors. At least 2 feet (600 mm) of pull wire shall be doubled back into the conduit at each termination.

662.6-BACKFILL:

All excavations shall be backfilled with suitable random material in horizontal layers not to exceed 4 inches (100 mm) after compaction. Each lift shall be compacted to the satisfaction of the Engineer. Testing is not required.

All surplus material shall be removed from the right-of-way and the backfill finished flush with surrounding natural ground, including replacement of any damaged facilities or appurtenances. The Contractor shall restore all areas disturbed by this excavation or other operations to their original conditions including grading, seeding, mulching and fertilizing as directed by the Engineer.

662.7-MANHOLES AND JUNCTION BOXES:

Boxes shall be located as shown on the Plans. Manholes and junction boxes shall be set so that the top of cover will be level with the surface without using an excessive amount of mortar for setting the metal frames.

Fill material for drainage shall be laid 12 in. (300 mm) minimum depth under the entire manhole or junction box. The aggregate used shall be stone or gravel of a grade approved by the Engineer and shall be by visual inspection a uniformly graded mixture of particles from $\frac{3}{8}$ to $\frac{3}{4}$ inch (10 to 20 mm) in nominal diameter.

The Contractor may, with the approval of the Engineer and at his own expense, install additional manholes or junction boxes to facilitate the work of installing conduit and pulling cable.

662.8-LUMINAIRES:

No luminaire shall be installed until the lamp socket position has been inspected and approved by the Engineer for conformance to the manufacturers recommended position for the specified distribution.

All luminaires shall be properly adjusted to produce the maximum illumination on the roadway surface, without disrupting the intended light distribution pattern.

The connection between the luminaire and connector kits shall be made with # 10 wires.

662.9-CABLES:

The Contractor shall provide adequate equipment for installation of cable, and shall pull all wires through conduits in such a manner as not to score, cut, twist or damage the protective covering or insulation. In the pulling of cables into conduits, where the strain on the cables is likely to prove excessive, the Contractor shall use soapstone powder as a lubricant. Where two or more cables are to occupy the same conduit, they shall be drawn in together and kept parallel to each other by the use of a pulling head.

Without exception, cables in manholes, junction boxes and bases shall be provided with an adequate amount of slack for subsequent connects and shall be arranged as ordered by the Engineer. After the cables have been installed

662.10

and pending permanent connection, the end of each section of cable in manholes, junction boxes, bases and panel boxes shall be carefully sealed, using rubber tape, and painted with a sealing type of waterproof compound.

Cables in manholes and junction boxes shall be placed on cable racks while waiting permanent connection. Ends of cable not connected to any device, which are to remain after completion of construction, shall be insulated and sealed in a manner similar to a special splice. Cables in manholes and junction boxes shall be neatly arranged in a workmanlike manner and laced with nylon cable straps.

The Contractor, in connecting sockets, outlets and other similar equipment, shall ground the most accessible bare parts of each piece of equipment. In order ensure that this has been done, each piece of equipment shall be tested after installation, and under the supervision of the Engineer, with a test lamp, one leg of which has been connected to a definite ground, or by other approved means of testing.

All cable in junction boxes and lighting supports shall be tested for circuit connections which shall be in conformity with those indicated on the detail drawings. All cables in junction boxes, manholes and lighting supports/lighting support bases shall be provided with individual non-corrosive metal (minimum 1 ½ in. (40 mm) diameter) tags, die stamped with the control station (as applicable), circuit and phase designation. Similarly designed plastic tags shall be used in control stations. The tags shall be securely attached to the cables with nylon cord of 1/16 in. (2 mm) minimum diameter.

Upon completion of each wiring system, and before any connection is made to operating equipment, it shall be the responsibility of the Contractor to perform, in the presence of the Engineer, the following tests of each circuit to determine where the installations are in acceptable working order:

Tests for continuity

Tests for grounds

Tests for insulation resistance between circuit wires and from circuit wires to ground

Upon completion of the electrical system, with fuses removed and before energizing, the insulation resistance shall be not less than fivemegohms.

662.10-CABLE-IN-DUCT:

At sign bridges where no sign lighting is contemplated under this contract, a sufficient length of cable shall be brought out of the ground or conduit system and extended up to the handhole or junction box of the sign bridge to permit future connections to sign lighting circuits without the need for splicing in additional underground cable.

Underground cable shall be installed at a depth of not less than 30 in. (750 mm) below finished grade or within the protection of galvanized metal conduit under roadways or in structures. Cable to be placed within the protection of conduit in structures may be installed without the polyethylene duct specified,

provided that the duct originating from an underground location is continuous to the first junction box or other terminal connection on the structure. The general location of the cable is shown in the details of the Plans. However, the Contractor shall locate all underground cable in a manner that will preclude damage to cable resulting from subsequent construction operations. The conductor size indicated in the Plans is the minimum size permitted.

Cable placed in continuous conduit raceways shall be terminated with an appropriate splice connection at each junction box provided in the conduit system even though a lighting unit does not exist at that location, unless directed otherwise by the Engineer in the field.

A $\frac{5}{8}$ in. by 8 ft. (15.88 mm by 2.4 m) copper weld ground rod shall be installed at each ground mounted sign bridge. Installation and connections to units shall be as directed by the Engineer. The grounding conductor shall be connected to the grounding lug in each lighting support and sign bridge column.

The polyethylene ducts, where required, shall be continuous to within 6 inches (150 mm) of a terminal connection.

The Contractor shall exercise care in the installation of the cable-in-duct to insure that the completed duct raceway is smooth and free of sharp bends and that the cables inside the duct are free and are capable of being removed and replaced in the completed cable-in-duct assembly.

Connections and terminations of cable required at existing distribution centers including fuses, hardware and site restoration as required to make the lighting circuits complete and operable, and installation of ground rods to sign bridges shall be considered incidental to this item

662.11-LIGHTING SUPPORTS:

Lighting supports shall be located in accordance with the details shown on the Plans governing the spacings and set backs to provide continuously aligned lighting support installation, unless otherwise ordered by the Engineer.

662.11.1-Types I, II, III, IV, V and VII: Luminaire support arms shall be set normal to the roadway unless otherwise directed by the Plans or the Engineer. Each lighting support (except for twin arm poles and Type VII) shall be raked a horizontal distance from vertical at the top of the pole equal to the taper of the pole in inches per foot (millimeters per meter) times the height of the pole in feet (meters), unless otherwise directed by the Plans or the Engineer. Lighting support wiring shall consist of # 10AWG single conductor, THWN insulated wire for both neutral and phase legs, and shall conform to the requirements for cables outlined in the preceding paragraphs.

When Type V lighting supports are to be erected on bridges, the entire assembly, including support arms and luminaires, shall be fully installed as a complete assembly at one time. When Types V or VII lighting supports are to be in contact with dissimilar materials: e.g., non-galvanized steel or concrete, the contacting parts shall be protected from corrosion by appropriate painting as noted in Section 1.5.4 of AASHTO "Standard Specifications for Structural

662.11.2

Supports for Highway Signs, Luminaires and Traffic Signals".

Aluminum surfaces that are to be in contact with concrete shall be given a heavy coat of alkali-resistant bituminous paint before installation.

The Contractor shall take full responsibility for checking all cross sections to determine final support lengths.

662.11.2-Type X: The loading, transporting, unloading and piling of structural materials shall be conducted so that the metal will be kept clean and free from injury in handling. Structural materials shall be stored above the ground upon platforms, skids, blocks or other supports. They shall be kept free from accumulation of dirt, oil, acids, or other foreign matter.

The manufacturer shall supply the Division with complete written instructions for the installation, operation and maintenance of the lighting supports and also complete parts lists for all items included by manufacturer and part number. The Contractor shall install the lighting supports strictly in accordance with the manufacturer's instructions. Extreme care should be exercised during lifting and plumbing. The manufacturer shall supply factory assistance in field assembly and installation when deemed necessary by Division. After the lighting support with all devices has been fully erected, the lowering devices shall be subjected to repetitive cycles of operation as a test.

662.12-FOUNDATIONS:

Footers shall conform to the sizes and shapes shown on the Plans, and shall be poured monolithically. The excavation shall conform to the neat lines of the footer. The top 12 in. (300 mm) and upper portion of the foundation shall be formed and floated and finished smooth on all sides. Castings may be used when deemed necessary by the Engineer to prevent caving of the soil. When casings are used, it is preferable that they be withdrawn as the shaft is filled with concrete. A concrete head of at least 2 feet (600 mm) should be maintained above the bottom of the casing. If any upward movement of the concrete or reinforcement cage occurs at the beginning of the casing pulling operation or at any time during casing pulling, removal should be stopped immediately and the casing left in place.

The conduit bends and anchor bolts shall be accurately set (by template) in the forms and rigidly held in position during concreting operations. No welding shall be permitted on anchor bolts, except at the bottom. Anchor bolts for Type X lighting supports shall be caged into a unit and shall include a steel template at the bottom for presetting. Reinforcement (vertical bars and hooping) shall be completely assembled and placed into position as a unit. The unit must be adequately supported in the excavation to insure centering for the entire length of the shaft.

662.13-GROUNDING:

662.13.1-General: The necessary conduit, conductors, bonding jumpers, clamps, connectors, ground rods, etc. for the grounding system shall be

furnished, installed and connected by the Contractor. The grounding system shall be considered as an integral part of the system to which it belongs, e.g. conduit, manholes, junction boxes, luminaires, lighting supports, service and control stations, navigation lighting system, structures, etc. as appropriate.

In general, alternating current circuits, enclosures and frames of electrical apparatus, and conduit systems must be effectively and permanently grounded with a cross section as required by the National Electrical Code and of capacity sufficient to ensure continuity and continued effectiveness of the ground connections for fault current. Ground conductors must be as short and straight as possible, protected from mechanical injury and, where practicable, without splice or joint.

662.13.2-Codes and Approvals: All grounding work shall be done in accordance with the latest edition and revisions of the National Electrical Code and the regulations of State and local codes.

All connections in ground network shall be done of a type approved by NEC, Article 250.

662.13.3-Metal Conduits: All metal (rigid steel) conduit ends shall be bonded and grounded by means of a # 8 bare copper cable. The grounding shall be accomplished by driving ground rods as detailed on the Standard Drawings or the Plans. Grounding from the conduit to the ground rod in a junction box or manhole shall be accomplished by use of a # 8 bare copper cable. Grounding from the conduit to a lighting support shall be accomplished by use of an insulated (green) copper conductor equal in size to the largest adjoining phase wire except where otherwise called for on the Plans. The connection of the bonding cable to the junction box frames and to the shafts of the lighting supports shall be done by means of a grounding stud. The neutral conductor shall be grounded at the service and control station.

662.13.4-Lighting Supports on Bridges: The lighting supports installed on bridge structures shall be grounded by bonding the grounding bushings of the metal conduit terminating to the ground connector in the pole shaft or parapet bracket. The other end of this conduit, which terminates in a junction box, shall be bonded to the junction box frame and to an insulated ground conductor which shall be installed in the same conduit as the lighting circuit conductors. This ground conductor shall be continuous across each bridge, and it shall be attached to the ground rod in the junction box or lighting support adjacent to each end of a bridge.

662.13.5-Service and Control Stations: Grounding of all service and control stations shall be accomplished by means of a ground connector installed in the service cabinets where shown on the Plans and bonding all conduit ground bushings, metal casing of equipment, and neutral conductors by means of individual # 4 conductors, as elsewhere specified to the above mentioned

662.14

ground connector. The other ends of these conduits shall be bonded together and connected to the ground rod in the adjacent concrete junction boxes.

662.14-TESTING:

The Contractor is advised that before proceeding with any work under this Contract, the Contractor shall conduct the necessary continuity and insulation tests to establish the integrity of cable runs already in place. The Contractor shall report any cable fault found to the Engineer. In case any fault is located while contract work is in progress, and which has not been reported by the Contractor as prescribed, then the Contractor shall be responsible for the correction of any such fault without any extra compensation.

Continuity and insulation tests shall also be performed in a manner satisfactory to the Engineer on cable runs to be placed under this contract. The Contractor shall be responsible for the correction of any fault discovered.

With all equipment connected to the wiring system, a functional test shall be performed by the Contractor in the presence of the Engineer to demonstrate that the system as a whole and all parts thereof function as specified or intended. Any defective materials or faulty or improper installation shall be permanently corrected by repairs or replacements to be made by the Contractor to the satisfaction of the Engineer at no additional cost.

Lighting circuits shall then be subjected to such other tests as may be required, including additional insulation resistance testing as detailed in 662.9, and shall be the responsibility of the Contractor to perform these tests in the presence of the Engineer or authorized representative. All tests shall be performed at the expense of the Contractor.

After the installation is completed, the Contractor shall conduct a continuous 24-hour operating test for approval. In addition, final acceptance of an installation will not occur until 30 days of operation termed satisfactory by the Engineer.

During the 30 days of operation, the Contractor shall be responsible for repairing or replacing any defective equipment within 24 hours after being notified by the Engineer. After any malfunctioning equipment has been repaired or replaced, the 30 day test shall begin anew.

662.15-METHOD OF MEASUREMENT:

662.15.1-Conduit: Galvanized steel conduit and PVC conduit will be measured as a complete and operable conduit system on a lump sum basis per service.

662.15.2-Manholes: Manholes will be measured as a complete unit in place on a per each basis.

662.15.3-Junction Box: Junction Box Type A, B, C, H, or L will be measured as a complete unit in place on a per each basis.

662.15.4-Luminaires: Luminaires will be measured as a complete unit in place on a per each basis including lamp of wattage called for on the Plans.

662.15.5-Cable: Cable will be measured as a complete and operable cable system on a lump sum basis per service, including all connector kits necessary.

662.15.6-Cable-in-Duct: Cable-in-Duct will be measured as a complete and operable duct system on a lump sum basis per service.

662.15.7-Lighting Supports: Lighting supports will be measured per each per type furnished and installed, including support base and foundation as required for each support.

662.15.8-Service and Control Station: Service and control station will be measured as a complete and operable unit in place on a per lump sum per service basis.

662.15.9-Incidental Electrical Work: Incidental electrical work will be measured as a complete unit on a lump sum basis. Measurement of the unit will be based upon the amount of incidental work shown on the Plans and as necessary to complete the work.

662.15.10-Electrical Tests: Electrical tests will be measured as a complete unit on a lump sum basis per service, including all tests performed as required by the Plans and Specifications.

662.15.11-System Modification: System modification will be measured as a complete unit on a lump sum basis. Measurement of the unit will be based upon the actual amount of changes performed on previously installed systems as called for on the Plans and as necessary to complete the work.

662.15.12-Navigation Lighting System: Navigation lighting system will be measured as a complete and operable system in place on a lump sum per service basis. If the project requires temporary protection of any existing or new structure/substructure for an interim period of construction, all such temporary items/facilities shall be included in the pay item.

662.16-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which prices and payments shall be full compensation for furnishing all the materials and doing all work in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work. All incidental work and materials for which no basis of payment is provided will be considered as completely covered by the prices bid for the items included in the contract.

SECTION 663

PAVEMENT MARKINGS

663.1-DESCRIPTION:

Pavement markings shall consist of furnishing and installing various types of markings. It shall include, but is not limited to, edge lines, lane lines, barrier lines, channelizing lines, stop and crosswalk lines, stripes, curb marking, island marking, lane arrows, lane letters and raised markers, or combinations thereof, in accordance with Contract plans and the following specifications or as directed by the Engineer.

All details not specified or not shown on the Plans shall conform to the details and requirements set forth in the following publication:

The Manual on Uniform Traffic Control Devices for Streets and Highways, latest issue, as printed by the Federal Highway Administration, U.S. Department of Transportation. (Referred to as the MUTCD.)

663.2-MATERIALS:

Materials shall conform to the following Subsections of Division 700 of the Standard Specifications:

MATERIAL	SUBSECTION
White or Yellow Fast-Dry Traffic Zone Paint	711.41
Pavement Marking Material	711.40
Extruded Thermoplastic Pavement Marking Material	715.40.1
Preformed Traffic Markings	715.40.2
Temporary Pavement Markings	715.40.4
Raised Markers	715.40.6

663.3-TYPES OF PAVEMENT MARKINGS:

663.3.1-Edge Lines: Edge lines shall be continuous, broken or dotted white beaded stripes or continuous yellow beaded stripes, 4 inches (100 mm) in width, or as specified on the Plans. Color to be specified on Plans. Center of stripe shall be located 6 inches (150 mm) from the edge of the pavement or as specified on the Plans.

Broken edge lines shall be white beaded stripes applied in lengths of 10 ft. (3 m), separated by gaps of 30 feet (9 m).

Dotted edge lines shall be white beaded stripes, applied in lengths of 2 feet (0.6 m), separated by gaps of 13 feet (4 m).

663.3.2-Lane Lines and Centerline: Lane lines and centerlines shall be lines between contiguous lanes of pavement. They shall be white or yellow, beaded stripes, applied in lengths of 10 feet (3 m), separated by gaps of 30 feet (9 m). Where applied to bituminous surfaces, the center of the stripes shall be located exactly half way between the centers of contiguous lanes. Where applied to portland cement concrete pavement, the center of the stripe shall be offset to the left and 4 inches (100 mm) from the longitudinal joint.

663.3.3-Barrier Lines: Barrier lines shall be continuous yellow beaded stripes, 4 inches (100 mm) in width. Barrier lines shall be located as shown on the Plans.

663.3.4-Channelizing Lines: Channelizing lines shall be continuous white beaded stripes. The width of line and use shall be as detailed on the Plans.

663.3.5-Stop and Crosswalk Lines: Stop lines shall be solid white beaded lines, not less than 12 in. (300 mm) nor more than 24 in. (600 mm) wide, or as specified on the Plans. Crosswalk lines shall be solid white beaded lines, not less than 6 inches (150 mm) nor more than 12 in. (300 mm) wide.

663.3.6-Stripes: These markings are transverse, diagonal or longitudinal white or yellow beaded lines 12 in. (300 mm) to 24 in. (600 mm) wide. They are used to increase the visibility of pedestrian crosswalk areas and to designate

663.3.7

neutral traffic zones formed by channelizing lines or edge lines. Location, spacing and use of these stripes shall be shown on the Plans.

663.3.7-Curb and Island Markings: Where specified, exposed surfaces of curbs and paved islands shall be prepared in accordance with 663.4 and painted solid with yellow or white traffic zone paint and covered with glass beads. Color to be specified on the Plans.

663.3.8-Lane Arrows: Lane arrows shall be white beaded markings located and dimensioned as shown on the Plans.

663.3.9-Lane Letters: Lane letters shall be white beaded markings located and dimensioned as shown on the Plans.

663.3.10-Raised Pavement Markers: Raised pavement markers are button or other type reflective or nonreflective raised markings. Type and installation are as shown on the Plans.

CONSTRUCTION METHODS

663.4-PAVEMENT PREPARATION - PREMARKING, CODING:

The Contractor shall clean all debris from the surface to be marked by means of a power broom, compressed air or other mechanical means to the satisfaction of the Engineer. Markings and markers shall be applied only when the surface is clean and dry and when the ambient air temperature is 50° F (10° C) or above, unless otherwise stated in the material specification.

If pavement markings are included in the contract, they shall be applied in a timely manner and in the patterns directed by the MUTCD.

When portland cement concrete is to be painted with Type I or Type II traffic zone paint and it is called for on the Plans, the area to be painted shall be treated when dry, prior to painting, with a solution composed of one part by volume of concentrated (75 percent) phosphoric acid mixed with 22 parts by volume of water. The rate of application shall be 10 gal. per mile (km) of 4 in. (38 liters per km of 100 mm) stripe or one gallon per 20 sq. yd. (0.25 liters per square meter) of surface. Acid pretreatment shall be allowed to dry for at least one hour prior to the application of paint.

When using extruded or hot-sprayed thermoplastic material or prefabricated temporary pavement markings, primer (sealer) shall be applied in front of the applicator. The primer (sealer) shall be of the type and be applied at the rate as recommended by the manufacturer of the material.

All surface cleaning, surface pre-treatment and premarking shall be performed by the Contractor prior to the installation of the proposed markings, or markers, and shall be subject to approval by the Engineer.

Coding and premarking changes in traffic flow patterns, i.e., passing, no-passing zones, is very critical and should always be approved by the Engineer.

663.5-APPLICATION:

663.5.1-General: The Contractor shall supply devices, suitable to the Engineer, to measure thickness of the applied markings.

The Contractor shall supply all of the marking material, necessary auxiliary vehicles and traffic control devices required for the completion of the project.

The Contractor shall provide and have approved by the Division a plan for traffic control and maintenance for all phases of the marking operations. The plan must be approved by the Division prior to the beginning of work. All traffic control plans shall be in conformance with provisions in the standard, "Traffic Control for Street and Highway Construction and Maintenance Operations," published by the Division.

663.5.3 -Blank

663.5.4-Extruded Thermoplastic Pavement Markings: Extruded thermoplastic pavement markings shall have a uniform thickness throughout their lengths and widths. Unless otherwise specified in the Plans, the minimum thickness of the markings applied by extrusion shall not be less than 90 mils (2.3 mm) in the center of the marking and 60 mils (1.5 mm) at one half inch (13 mm) from the edge. Maximum thickness shall be 125 mils (3.2 mm).

663.5.5-Preformed Traffic Markings: Preformed traffic markings shall be fabricated to a uniform thickness of not less than that tested in the Division's field evaluation test. The markings shall be capable of being affixed to bituminous or portland cement concrete pavements as recommended by the manufacturer.

663.5.6-Blank:

663.5.7 Temporary Pavement Markings: Type VIIA Temporary Pavement Markings shall be prefabricated to a uniform thickness of not less than 20 mils (0.5 mm) nor more than 45 mils (1.1 mm). The marking shall be capable of being affixed to bituminous or portland cement concrete pavement by a pressure-sensitive precoated adhesive and require no activation. The marking material shall be flexible, formable and following application shall remain conformed to the texture of the pavement surface.

Type VIIB Temporary Pavement Markings shall be installed in accordance with manufacturer's recommendations. The pavement surface shall be dry at the time of pavement marking application. The Contractor shall remove all dirt, debris, loose particles and heavy oil residues from road surface application areas immediately prior to installation of pavement markings.

Type VIIB temporary pavement marking film shall be applied with a mechanical applicator to provide pavement lines which are neat, accurate and uniform. The mechanical applicator shall be equipped with a film cut-off

663.5.8

device. The pavement marking film shall be rolled or tamped to facilitate adhesion to road surface.

All temporary pavement markings shall present a uniform appearance and shall be clearly visible during the day and night for traffic control. Pavement markings which either fail to adhere to the pavement, provide a uniform appearance or be clearly visible during day or night shall be corrected by the Contractor in a manner acceptable to the Engineer at no additional cost to the Division.

When temporary pavement markings are no longer required as approved or determined by the Engineer, the plastic pavement marking film shall be neatly removed in its entirety.

Temporary pavement markings shall be Type VIIIB.

663.5.8-Blank

663.5.9-Raised Markers: Raised markers shall be installed as specified in the Plans. The adhesive used for the installation of the markers shall be that which is furnished or recommended by the manufacturer of the marker. The adhesive shall be blended and used only as recommended by the manufacturer of the adhesive.

The adhesive shall be mechanically mixed and placed on any job requiring 50 or more markers.

663.5.10-Glass Beads: Glass beads applied to the surface of the completed marking material shall be applied by an automatic bead dispenser attached to the pavement marking equipment in such a manner that the beads are dispensed uniformly and almost instantly upon the marking as the marking is being applied to the road surface. The bead dispenser shall be equipped with an automatic cut-off control, synchronized with the cut-off of the pavement marking equipment.

Beads shall be dispensed at the following rate for types of material shown:

Marking Material

Extruded Thermoplastic

Bead Application Rate

05 kg/liter²

Glass beads shall be uniformly incorporated into the extruded thermoplastic pavement marking material at a rate of not less than 20% nor more than 35% by weight of the material.

663.6-METHOD OF MEASUREMENT:

Pavement markings shall be measured complete in place in the units designated below. Length measurements shall exclude gaps. Calibrated and verified odometer measurements will be acceptable as method of measurement on edge lines (mainline only), lane lines or centerlines and barrier lines for plan quantities in excess of 10,000 linear ft. (3 000 m) or two linear miles (3.2 km).

Island marking will be measured by the square foot (meter) of island area painted.

663.7-BASIS OF PAYMENT:

663.7.1-General: The quantities, determined as provided above, will be paid for at the contract unit prices less adjustments referred to below, which shall constitute full compensation for furnishing all materials and doing all the work prescribed in a workmanlike and acceptable manner, including the furnishing of all the auxiliary vehicles, labor, tools, equipment, supplies and incidentals necessary to complete the work.

The payment for Temporary Pavement Markings includes removal of the pavement marking film.

663.7.2-Price Adjustments: Price adjustments for deficiencies in pavement markings, exclusive of Type II or IX pavement markings, not within tolerances listed shall be as set forth:

i. Deficiencies: The amount of marking material or beads applied per unit of length shall be computed by the Engineer. If such computation reveals that an insufficient quantity of either marking material or beads has been applied, the contract unit price shall be reduced in direct proportion to the percent of deficiency, up to 20 percent. However, if both beads marking material are deficient, only the greater deficiency be used to compute the deductions. If the deficiency is 20 percent, or more, the work shall be considered unsatisfactory and shall be redone at no additional cost to the Division.

ii. Tolerances: Any measurement given as length or width when referring to pavement marking lines or stripes shall have a tolerance of plus or minus 5 percent. This is to include any pattern of broken or dotted lines as well as spaces and gaps between markings. If, after sufficient sampling, the Engineer finds the installed markings not to be within the acceptable tolerance, either the work shall be considered unsatisfactory and shall be redone at no additional cost to the Division or, in case of an overage, no additional payment shall be made.

SECTION 664

TRAFFIC SAFETY DEVICES

664.1-DESCRIPTION:

This work shall consist of the furnishing and installing of various types of traffic safety devices in accordance with these Specifications and the Plans or as established by the Engineer. This work shall include, but not be limited to impact attenuating devices.

664.2-MATERIALS:

Materials shall conform to the requirements of the following subsections of Division 700 as manufactured by Energy Absorption Systems, Incorporated, or approved equal.

MATERIALS	SUBSECTION
Sand Barrel Impact Attenuating Device (Type V)	715.41.1
Crash Cushion Terminal Impact Attenuating Device (Type VI)	715.41.2
Truck Mounted Attenuating Devices (Type VII)	715.41.3
Quad Guard Terminal Device (Type VIII)	715.41.4

664.3-CONSTRUCTION METHODS:

664.3.1-Impact Attenuating Devices: Fabrication and installation of Impact Attenuating Devices shall be as detailed on the Plans or as directed by the Engineer. All work shall be done in a uniform, workmanlike manner.

The devices shall be located on a hard, flat surface, preferably concrete. The lateral slope of the installation site should be as level as possible and still provide adequate drainage.

The nose of the device shall have a XS-15 marker attached with alternating black and reflectorized yellow stripes in accordance with Section 3C-2 of the latest edition of the *Manual on Uniform Traffic Control Devices for Streets and Highways*. The width of the alternating stripes shall be 6 inches (152.4 mm). The stripes for construction zone attenuating devices shall be as above except the stripes shall be reflectorized white and reflectorized orange.

Type V devices shall be protected from freezing by mixing sodium chloride with the sand in a ratio of 1:10 by volume. Clean concrete on building sand with a moisture content of less than three percent shall be used. The sand shall weigh 100 ± 5 pounds per cubic foot ($1\,270 \pm 60$ kg per cubic meter). Type V devices shall be winterized in accordance with [715.41](#).

664.3.1.1- Crash Cushion and Quad Guard Terminal Devices:

A backup structure accommodating the width of the impact cushion and providing adequate length for the cushion must be constructed or modified into the existing structure as shown on the plans. The backup structure must be capable of resisting the imposed forces brought upon it by the unit.

664.3.1.2-Sand Barrel Devices (Type V):

The assembly of all parts of the device, including filling with sand, shall be in the sequence and according to the recommendations of the manufacturer. The weight and location of each module and overall arrangement of each installation shall be as shown on the Plans. The figures within each circle on the Plans indicate the amount of sand, in pounds (kg), contained in each module. Leave one to 6 inches (24 to 150 mm) clearance between modules to facilitate lid installation. Each barrel location shall be painted on the pavement with a circle and the weight of sand in pounds (kg).

"Core-type" modules of 2,100 pound (953 kg) design require a sand seal to be placed on the bottom before the sand is added. "Wine glass-type" modules on structures require a stem block. If modules are preassembled before delivery to the site, the modules must be shipped upright on their bottom and not forced into an oval shape.

664.4-METHOD OF MEASUREMENT:

664.4.1-Impact Attenuating Devices:

664.5

This work shall be measured as a unit, complete and in place.

664.5-BASIS OF PAYMENT:

The quantities, determined as provided above, shall be paid for at the contract unit price for the items listed below, which prices and payment shall be full compensation for furnishing all the materials and doing all work prescribed in a workmanlike and acceptable manner, including all tools, equipment, supplies, and incidentals necessary to complete and, where required, winterize the items. All incidental work and materials for which no basis of payment is provided will be considered as completely covered by the prices bid for the items included in the contract.

664.6-PAY ITEMS:

SECTION 665
PLUGGING GAS, OIL, AND DRILLED WATER WELLS

665.1-DESCRIPTION:

This work shall consist of plugging oil wells as designated on the Plans. This work shall also consist of plugging drilled water wells unless otherwise noted on the Plans.

665.2-MATERIALS:

665.2.1-Oil and Gas Wells: All materials used for plugging the oil wells and gas wells shall meet the requirements of the laws of the State of West Virginia.

665.2.2-Drilled Water Wells: Materials for plugging water wells shall meet the requirements of Division 700 as follows:

MATERIAL	SUBSECTION
Bentonite	715.45
Aggregate	703

Concrete shall be class D conforming to applicable requirements of 601 and may be with or without air entrainment at the option of the Contractor. The concrete shall be placed in accordance with current regulations of the Oil and Gas Division of the Department of Mines when a coal seam is involved.

CONSTRUCTION METHODS

665.3-GENERAL:

The Division will obtain all necessary permits, bonds and licenses required for this work.

665.4-PLUGGING GAS AND OIL WELLS:

The Contractor shall plug the gas well or oil well prior to starting any other construction in the vicinity of the well. The well shall be plugged using bentonite mud and neat cement as provided for by law, and the work shall be accomplished by a qualified service company meeting the approval of the Gas and Oil Division of West Virginia Department of Mines. All work pertaining to plugging the well must be performed under the supervision of the representative of the Division of Mines. The Contractor shall notify the Project Engineer and the Division of Mines at least 14 days in advance of the date on which the Contractor intends to begin work.

The Division will make available upon request copies of Sections 9 and 10, Article 4, Chapter 22 of the Gas and Oil Laws.

665.5-Plugging Drilled Water Wells: The Contractor shall plug all drilled water wells within the right-of-way limits prior to starting any other work in the vicinity of the wells. The wells shall be filled from the bottom with a mixture of aggregate and bentonite mud to within 20 ft. (6 m) of the surface. The aggregate for each specific site may be any of the following AASHTO sizes: 7, 57, or 67. The bentonite shall be proportioned with fresh water as follows: eight percent bentonite by volume (minimum) to 92 percent by volume fresh water (maximum). The final in-place product shall be a consistent mixture of bentonite mud and aggregate. The upper 20 ft. (6 m) shall be plugged using Class D or other suitable concrete. All coal seams of 24 in. (600 mm) or more in thickness or a seam that is being mined that the well encounters or passes

if the well passes through the coal, or from the base of the coal seam, if the well ends within the coal seam, to 20 ft. (6 m) above the coal seam.

The Contractor at their option may plug all drilled water wells from the bottom of the well to the surface with Class D or other suitable concrete in lieu of the bentonite mud and aggregate.

665.6-METHOD OF MEASUREMENT:

Plugging gas wells, oil wells, and drilled water wells will be measured by the unit.

665.7-BASIS OF PAYMENT:

The quantity, determined as provided above, will be paid for as provided below, which price and payment shall constitute full compensation for

furnishing all material, labor, tools, equipment and all incidentals necessary to complete this work.

665.8-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
665001-*	PLUGGING GAS WELL	EACH
665002-*	PLUGGING OIL WELL	EACH
665003-*	PLUGGING DRILLED WATER WELL	EACH

666-669-BLANK:

SECTION 670 WATERLINE INSTALLATION

670.1 – DESCRIPTION:

This work shall consist of the construction or relocation of waterlines, including installation of valves and valve boxes, casing pipe, fire hydrants, water meters, meter boxes, and all required appurtenances all in reasonably close conformity with lines, grades, dimensions and locations shown on the Plans or established by the Engineer.

670.2–MATERIALS:

The material shall meet the requirements of the following subsections.

MATERIAL	SUBSECTION
Controlled Low Strength Material, Type A	219
Ductile Iron Pipe	718.1
Cement lining	718.1.1
Fittings	718.1.2
Mechanical Joints	718.1.3
Push-On Joints	718.1.3
Flanged Joints	718.1.4
Plastic Pipe (PVC)	718.5
Plastic Pipe (Polyethylene)	718.7
Plastic Pipe Fittings	718.8
Copper Service Line	718.9
Copper Service Line Fittings	718.9.1
Gate Valves	718.10
Valve Boxes	718.11
Casing Pipe (Steel)	718.12
Fire Hydrants	718.13
Meters	718.14
Miscellaneous Steel	718.15

CONSTRUCTION METHODS

670.3-GENERAL:

The Contractor shall furnish all materials, perform all excavation and backfill, construct all necessary joints and connections, install all valves, construct all necessary joints and connections, install all valves, construct all appurtenances, install all temporary lines and dispose of all surplus excavation and discarded material and perform all work as may be necessary to complete the water line relocations and installations as set forth in these Specifications and as shown on the Plans.

The Contractor shall assume all risk and bear any loss or injury to property or persons occasioned by neglect or accident during the progress of the work. The Contractor shall exercise special care during the water line relocation so as not to damage any existing utility line or appurtenances.

It is of prime importance that the Contractor, in the performance of their work, does not disrupt the operation of the existing water facilities in any manner or at any time without the express prior approval of the Engineer. Prior notice shall be given to the Engineer by the Contractor of their intention to begin any work that will disrupt or appreciably alter normal system operation so that ample opportunity may be given to the Engineer to notify the owner to prepare for emergency operation, if necessary. The Engineer, upon advice of the owner, will have the sole right of determining at what times and in what order the Contractor shall undertake work involving connections and modifications to the existing system.

The Contractor shall dig test pits as necessary to determine the size of fittings required for connections to existing lines. All material necessary for tie-ins shall be at the work site prior to any disruption of service. Once a connection is started, work shall be continuous until completion. The Contractor shall be responsible for the unloading, storing, hauling, and distribution of all materials and shall replace, at their own expense, all such material that is damaged, destroyed or lost during or after unloading. All pipe, pipe fittings, valves and accessories shall be handled in a manner in order to avoid shock and to protect the coating material. Material not needed for immediate construction shall be stored in a safe manner at places provided by the Contractor and approved by the Engineer.

If the Contractor should observe either proposed or existing sewers or water lines in close proximity the Contractor shall notify the Engineer. The Engineer will determine if the observed situation lacks conformity to the State Department of Health's Design Standards for Water Distribution Systems, its magnitude and the course of action. Additional costs necessitated by a modification in the plan of construction will be paid for in accordance with [109.4](#).

670.4-WATER PIPE:

670.4.1-Trench Excavation: Excavation of the trench may be done either by hand or by the use of suitable trenching equipment. The invert profile as shown on the Plans shall be followed except where changes are authorized in writing by the Engineer to avoid existing structures or to suit topography. The depth of trench shall be increased where necessary to procure a smoothly curved profile or to avoid existing structures. The trench shall be excavated in such a manner as to provide uniform and continuous bearing and support for the pipe and shall be excavated to the depth required to give a minimum of 42 in. (1050 mm) cover from finished grade to the top (outside) of the pipe barrel, except under roadways where minimum cover shall be 30 in. (750 mm) from subgrade to the top of the pipe barrel. The depth of cover may be modified at creek crossings or at other dips in the profile, when approved by the Engineer, providing it does not extend more than 100 feet (30 m) with a cover of less than 42 in. (1050 mm). In the event it is required to decrease the cover to less than 3 feet (900 mm), the pipe line shall be insulated for that distance.

Where stones, dry clay, hard pan, shale or cemented gravel are exposed at the bottom of the trench, the trench shall be excavated to at least 3 inches (75 mm) and not more than 6 inches (150 mm) below the specified grade. Where the bottom of the trench at grade is found to be unstable or include ashes, cinders, all types of refuse, vegetable or other organic material, the Contractor shall excavate and remove such unsuitable material to the width and depth ordered by the Engineer. The trench shall be backfilled to grade with approved material; replacement material shall consist of random material, as directed by the Engineer. Each layer shall not exceed 4 inches (200 mm) compacted depth and shall be compacted in accordance with 670.4.5. The bedding shall be finished by means of hand tools to provide a uniform and continuous bearing and support for the pipe.

Where the bottom of trench at grade is found to consist of material which is unstable to such a degree that in the opinion of the Engineer it cannot be removed and replaced with material suitable to support the pipe properly, the Contractor shall construct a foundation for the pipe, consisting of concrete, pilings, timber or other materials or as directed by the Engineer. Where excavation is made in rock or boulders, the rock shall be removed to provide a clearance of at least 6 inches (150 mm) for pipe 24 inches (600 mm) in diameter or smaller and at least 9 inches (225 mm) for pipe larger than 24 inches (600 mm) in diameter, below and on each side of all pipe, valves and fittings. The trench shall be backfilled to grade with approved material in 4 inch (200 mm) compacted layers. Each layer shall be thoroughly compacted in accordance with 670.4.5 and the bedding shall be finished by means of hand tools to provide a uniform and continuous bearing and support for the pipe. The width of the trench shall be ample to permit the pipe to be laid and jointed properly and to permit the backfill to be placed and compacted as specified. Trench widths shall be in accordance with Table 670.4. 1. Excessive trench widths will not be permitted. Where

necessary for protection of workers or to avoid undermining or otherwise damaging structures or property, the trench shall be properly and sufficiently shored and braced to prevent caving, slipping or cracking of the sides. Where bracing, sheeting or shoring are required or extra width is required for handling of specials, the trench shall be of such extra width to accommodate these items.

TABLE 670.4.1

Pipe Diameter inches (mm)	Trench Width Inches (mm)	Pipe Diameter inches (mm)	Trench Width Inches (mm)	Pipe Diameter inches (mm)	Trench Width Inches (mm)
2 (50)	18-26 (450-650)	10 (250)	22-34 (550-850)	20 (500)	32-44 (800-1 100)
3 (75)	18-26 (450-650)	12 (300)	24-36 (600-900)	24 (600)	36-48 (900-1 200)
4 (100)	18-28 (450-700)	14 (350)	26-38 (650-950)	30 (750)	42-54 (1 050-1 350)
6 (150)	18-30 (450-750)	16 (400)	28-40 (700-1 000)		
8 (200)	20-32 (500-800)	18 (450)	30-42 (750-1 050)		

Blasting for excavation will be performed only after securing the approval of the Engineer and only when proper precautions are taken for the protection of persons or property. The hours of blasting will be fixed by the Engineer. Any damage caused by blasting shall be repaired by the Contractor at their expense. The Contractor's method of procedure relative to blasting shall conform to local and state laws.

The Contractor shall exercise reasonable care to avoid damage to trees and hedges; electric, telephone and gas lines and installations; sewer lines; buildings; roads and all appurtenances thereto. Care shall be used to maintain driveways to permit free access to and from the different properties by the owners.

All excavated material shall be piled in a manner that will not endanger the work and will not obstruct sidewalks and driveways. Fire hydrants under pressure, valve boxes, service stop boxes, fire and police boxes or other utility controls shall be left unobstructed and accessible. Gutters shall be kept clear or other satisfactory provisions made for drainage, and natural watercourses shall not be obstructed. All trenches, material piles, equipment and pipe which may cause a hazard or serve as obstructions to either vehicular or pedestrian traffic shall be enclosed by fences or barricaded and adequately lighted, to protect persons from injury and to avoid property damage. Where traffic must cross open trenches, the Contractor shall provide suitable bridges, which will be subject to approval by the Engineer. The Contractor shall furnish temporary support, adequate protection and maintenance of all underground and surface structures, drains, sewers and other obstructions encountered in the progress of the work.

670.4.2-Laying and Joining: Proper implements, tools and facilities satisfactory to the Engineer shall be provided and used for the safe and convenient prosecution of the work. All pipe, fittings, valves, specials, and fire hydrants shall be carefully lowered into the trench piece by piece by means of a derrick, ropes or other suitable tools or equipment in such a manner as to prevent damage to the water main materials and protective coating and linings. Under no circumstances shall water main materials be dropped or dumped into the trench.

All pipe and fittings shall be carefully examined for defects and no pieces shall be laid which are known to be defective. Any defective or damaged pipe will be rejected. If any defective piece shall be discovered after having been laid, it shall be removed and replaced at the Contractor's expense. All pipes and fittings shall be thoroughly cleaned before they are laid and shall be kept clean until accepted in the completed work. Pipe which has been contaminated by mud or soil shall be cleaned with a swab.

The pipe shall be supported its full length by the uniform grade of the trench. Pipe ends shall not be left open, such as at the end of a day's work or during temporary suspension of construction, but shall be securely covered to prevent the entry of foreign matter or small animals. Kinks or sharp bends giving excessive deflection or which put pipe joints in strain will not be permitted. Table 670.4.2 shows the Maximum permissible deflection for various types of joints or pipe.

**TABLE 670.4.2 MAXIMUM PERMISSIBLE
DEFLECTION PER JOINT**

A. MECHANICAL JOINT PIPE:

Pipe Diameter Inches (mm)	*Maximum Deflection For 18-ft (5.5 m) Length inches (mm)	Pipe Diameter Inches (mm)	*Maximum Deflection For 18-ft (5.5 m) Length inches (mm)
2 (50)	31 (775)	12 (300)	20 (500)
3 (75)	31 (775)	14 (350)	13.5 (340)
4 (100)	31 (775)	16 (400)	13.5 (340)
6 (150)	27 (675)	18 (450)	11 (275)
8 (200)	20 (500)	20 (500)	11 (275)
10 (250)	20 (500)	24 (600)	9 (229)

B. "PUSH ON" TYPE JOINT PIPE:

Pipe Diameter Inches (mm)	*Maximum Deflection For 18-ft (5.5 m) Length inches (mm)
4 (100) thru 12 (300)	19 (475)
14 (350) thru 24 (600)	11 (275)

* Permissible deflection per joint for lengths more or less than 18 ft. (5.5 m) are proportional.

The maximum permissible deflection per joint shall be in accordance with the manufacturer's recommendations.

C. PLASTIC PIPE:

The maximum permissible deflection per joint shall be in accordance with the manufacturer's recommendations.

When cutting short lengths of copper pipe, a pipe cutter shall be used and care shall be taken to make the cut at right angles to the centerline of the pipe. In the case of "push on" pipe, the cut ends shall be tapered with a portable grinder or coarse file to match the manufactured taper.

Rigid plastic pipe such as polyvinyl chloride shall be jointed and laid in accordance with the manufacturers' recommendations. Plastic pipe may be sawn. Thrust blocking, pads, straps and clamp and rod assemblies shall be provided at fittings, valves or specials at the location and in the manner set forth on the Plans.

Joints for various types of ductile iron pipe shall be as follows:

- Ductile Iron Pipe “Push on” joint Type I
- Ductile Iron Pipe Mechanical joint Type II
- Ductile Iron Pipe Flange joint Type III

Type I: "Push on" Type Joint:

"Push on" type joints such as "Bell Tight", "Tite On" or equal joints shall be prepared by removing all dirt or foreign material from the bell end of pipe and inserting the gasket. The spigot end of the pipe shall be prepared by cleaning and applying a thin coat of approved lubricant after which the spigot end shall be centered in the bell and jacked on by using a special jack and choker sling. The procedure in making up this joint shall be performed in accordance with the recommendations of the manufacturer.

Type II: Mechanical joint:

When "making up" mechanical joints, the spigot end of each pipe shall be centered into the adjoining bell to within 1/8 in. of the total depth of the bell. The pipe shall be properly centered and have uniform space all around for reception of the gasket material. The gasket material, bolts, nuts and other accessories used in making mechanical or sleeve type joints shall be obtained from the manufacturer of the pipe and joint.

The surfaces of the spigot and bell shall be brushed thoroughly with a wire brush just prior to assembling. The spigot end shall be brushed with soapy water just prior to slipping the gasket on and entering into the bell.

When tightening bolts the gland shall be brought up toward the pipe flange evenly, maintaining approximately the same distance between the gland and the face of the flange at all points around the socket. This shall be done by partially tightening the bottom bolt first, then the top bolt, next two bolts at either side and last, the remaining bolts. This cycle shall be repeated until all bolts are within the range of thetorques listed below:

Bolt size, Inches (mm)	Range of Torque, Pounds (Newton meters)
5/8 (16)	40 (54) - 60 (81)
3/4 (20)	60 (81) – 90 (122)
1 (24)	70 (95) – 100 (140)
1¼ (30)	90 (122) – 120 (165)

If the effect of sealing is not obtained at the maximum torques indicated above, the joint must be disassembled and reassembled after thorough cleaning. A calibrated torque wrench shall be furnished by the Contractor and made available to the Engineer.

Type III. Flanged joint:

When making up flanged joints, a gasket shall be put in place, the flanges butted together and the bolts tightened in the manner as prescribed for mechanical joints.

Plastic Pipe joints:

Joints in plastic pipe formed of polyvinyl chloride shall be "push on" type. Joints in pipe formed of flexible polyethylene shall be constructed utilizing a plastic, nylon or brass insert secured by stainless steel clamp or may be butt fused or any other approved method as recommended by the manufacture.

Copper Pipe joints:

Copper pipe joints shall be made by use of copper flared joint couplings or fittings unless otherwise specified in the Plans or in the Bill of Materials.

670.4.3-Thrust Blocking: Thrust blocks shall be constructed where called for and to the dimensions shown on the Plans. Concrete used for thrust blocking shall be Class C concrete; however, Class B concrete may be used with no increase in cost.

670.4.4-Nuts, Bolts, Washer, Rods, Straps and Clamps: Where the use of nuts, bolts, washers, rods, straps and clamps is required due to the peculiarities of the installation, these items shall be installed and be of the size and dimension shown on the Plans or recommended by the manufacture.

670.4.5-Backfilling: Backfill material shall consist of suitable random material or controlled low strength material, type A. All material shall be free of particles larger than 3 inches (75 mm) and free from cinders, ashes, refuse, vegetable or other organic material. Controlled low strength material shall meet the requirements of Section 219. Unless otherwise specified on the plans or by the utility, controlled low strength material can be used as a substitute for random material at the option of the contractor.

The backfill material shall be deposited in the trench for its maximum width in layers not exceeding 4 inches (100 mm) after compaction. Quality control testing and acceptance of the backfill material will be according to the applicable sections of 207 and 716 with the following exceptions: The lot size will be one days production or 500 linear feet (150 m) which ever is less for a continuous section of conduit backfilled. The target percentage of dry density will be 95% for the backfill material and each lot shall have 5 density tests performed for quality control.

Backfill placed outside embankments and roadbed is to be compacted to or better than the average total dry density for the existing

670.4.6

soil. An average total dry density will be determined from representative density tests conducted for each existing soil. Quality control testing will normally consist of one test per 500 linear feet (150 m) of conduit installed and lot evaluations are not required. The moisture tolerance is not applicable.

Backfilling shall not be done in freezing weather, except by permission of the Engineer, and frozen material shall not be used. No backfilling shall be made where the material already in the trench is frozen.

From the bottom of the trench to the centerline of the pipe, the backfill material shall be placed by hand and compacted by approved hand tamps. From the centerline of the pipe to a height of 1 foot (300 mm) above the pipe, the backfill shall be placed by hand and compacted by use of approved mechanical tampers. The Contractor shall use special care in placing this portion of the backfill to avoid damaging or moving the pipe. The remainder of the backfill in the trench shall be placed by hand or mechanical means and compacted by approved mechanical tampers. All pipe after being bedded and backfilled shall be adequately protected before heavy equipment is permitted to cross during construction of the roadway. The Contractor will be held responsible for any damage to the pipe resulting from movement of equipment over the pipe. Prior to testing, the pipeline shall be backfilled in accordance with the Specifications.

The Contractor shall maintain the surface of the trench to the original ground surface until accepted by the Engineer. The job site shall be left in a neat and orderly condition to the satisfaction of the Engineer.

Excess material not needed for backfill and material unsuitable for backfill shall be removed from the site and disposed of by the Contractor. Additional backfill material as required to make up deficiency or to replace unsuitable excavated material shall be furnished by the Contractor at no additional cost, from approved borrow pits or from excavations on the roadway.

670.4.6-Testing: Where any section of the main is provided with concrete thrust blocking, the hydrostatic pressure test shall not be conducted until the concrete has reached 2000 psi compressive strength.

Each completed section of pipe line relocation shall be plugged at both ends, and connected to the existing main by means of temporary 1 in. (25 mm) corporation stops and 1 in. (25 mm) copper service lines with backflow prevention devices. After the main has been slowly filled with water in preparation for the hydrostatic pressure test, all air shall be expelled from the pipe. If fire hydrants or blowoffs are not available at high places, the Contractor shall make the necessary taps at points of highest elevation and insert the necessary corporation stops and copper service line in order that the air may be expelled. The main shall be subjected to the hydrostatic test pressure, indicated on the Plans for a period of time in accordance with the provisions herein, and as described in AWWA C600. Pressure shall be applied to the main by means of a hand pump for small lines or by use of a gasoline pump or fire engine for larger lines. During the

duration of the test, the lines shall be thoroughly examined for leakage at the joints and elimination of leakage effected where necessary. "Make up" water shall be measured with a displacement meter. Any cracked or defective pipes, fittings, valves or fire hydrants discovered in consequence of the pressure test shall be removed and replaced by the Contractor at their own expense. After replacing or correcting cracked or defective pipe, fittings or valves discovered in the test or correcting any leakage, the Contractor shall retest the pipe. The allowable leakage for a period of one hour shall be as shown in Equation 670.4.6. In the event the pipe line is tested in sections and temporary thrust blocking is required, a temporary plug or cap shall be installed and blocked with a screw jack firmly braced against the end of the trench or against a heavy timber embedded into the side of the trench.

Where pipe line construction ties into existing lines, and where it is not practicable to make a hydrostatic test testing shall not be required. Any leakage discovered in these sections shall be immediately corrected by the Contractor.

Upon completion of the testing, the temporary corporation stops and lines shall remain in place until the pipeline is disinfected, after which they shall be removed and the taps plugged.

Equation 670.4.6

$$\{\text{English}\} \quad L = \frac{ND\sqrt{P}}{7,400}$$

Where:

L =	allowable leakage, in gallons per hour
N =	number of joints in the length of pipeline tested
D =	nominal diameter of the pipe, in inches
P =	average test pressure during the leakage test, in pounds per square inch (gauge)

$$\{\text{Metric}\} \quad L_m = \frac{ND\sqrt{P}}{130,400}$$

Where:

L_m =	allowable leakage, in liters per hour
N =	number of joints in the length of pipeline tested
D =	nominal diameter of the pipe, in millimeters
P =	average test pressure during the leakage test, in killivolts per ampere

670.4.7-Disinfection: The requirements for disinfection during construction and previous to placing the line in service shall be in compliance with the requirements of the Public Utility involved. In the event the Public Utility has no requirements for disinfection; the following requirements shall govern:

670.4.7

Each completed section of pipeline constructed shall be sterilized by the addition of one pound (kg) of calcium hypochlorite powder containing 70 percent available chlorine for each 1,600 gallon (10 000 L) of water treated. Table 670.4.7 shows the length of pipe that one pound (0.75 kg) of calcium hypochlorite powder will disinfect. This may be introduced by pumping a liquid solution into the main as it is being filled, or it may be introduced dry by measured amounts placed inside the pipe at each joint immediately before the joint is made. In the latter case the pipe line must be filled from the low point and at a rate not to exceed 20 gal. (75 L) per minute. Water treated with calcium hypochlorite shall remain in the pipeline for a period of 24 hours. After the treated water is retained for the required time, the chlorine residual at the pipe extremities and other representative points shall be at least 50 PPM. Following chlorination all treated water shall be thoroughly flushed from the newly laid lines until the replacement water throughout its length shall be comparable to the quality of water served from the existing system.

TABLE 670.4.7-DISINFECTION CHART

Pipe Diameter Inches (millimeter)	Pipe Length Feet (meter)	Pipe Diameter Inches (millimeter)	Pipe Length Feet (meter)
2 (50)	10,000 (6 700)	12 (300)	270 (180)
3 (75)	4,300 (2 900)	14 (350)	200 (135)
4 (100)	2,500 (1 680)	16 (400)	150 (100)
6 (150)	1,100 (740)	18 (450)	120 (80)
8 (200)	600 (400)	20 (500)	100 (70)
10 (250)	400 (268)	24 (600)	70 (45)

* Length of pipe that one pound (kilogram) of calcium hypochlorite will disinfect.

In lieu of the liquid solution or dry application of calcium hypochlorite, a chlorine gas-water mixture may be introduced by means of a solution-feed chlorinating device. Devices for feeding the gas-water mixture shall provide means for preventing backflow of water into the chlorine cylinder. The duration of treatment and chlorine residual shall be as previously stated.

The Contractor shall contact the County Health Department prior to public use of the drinking water so they may perform sampling and testing in accordance with Health Department requirements.

Disinfection and testing shall be accomplished by the Contractor prior to performing any work in connecting to the existing main.

Where connecting into existing mains and it is not practicable to include the connecting pieces, i.e.; pipe, fittings, valves in the normal disinfecting process, the connecting pieces shall be swabbed with a chlorine solution containing not less than 1% Hypochlorite solution prior to making the connection.

670.5-GATE VALVES AND VALVE BOXES:

Gate valves shall be installed in accordance with 670.4. The valve box shall be set in such manner that no shock or stress is transferred to the valve. The valve box shall be centered and plumbed over the wrench nut of the valve. The valve box cover shall be set flush with the finished surface.

670.6-CASING PIPE:

Construction methods shall be as described under 670.4, where open trench construction is feasible. In the event that boring and jacking methods are specified in the Contract or are otherwise necessary to complete the installation, the applicable provisions of 604.11 shall govern.

670.7-FIRE HYDRANTS:

The work shall be performed in accordance with the requirements of 670.4. When relocating hydrants, no work shall be started on removing a hydrant until the pressure on the hydrant has been shut off. Before relocating a hydrant, it shall be thoroughly cleaned of all dirt and foreign matter.

All hydrants shall be provided with a concrete thrust block or anchorage as shown on the Plans and care shall be taken that the concrete does not obstruct any hydrant drain openings. All hydrants shall be set upon 0.5 cubic yard (meter) of AASHTO # 3 stone to provide drainage for the hydrant. The stone shall extend above the hydrant drain opening to prevent entrance of soil into the hydrant barrel. The thrust blocking and stone shall be placed as shown on the Plans.

670.8-METERS, METER BOXES, AND SPECIAL VALVES AND APPURTENANCES:

The construction method shall be as set forth in 670.4.

When removing and relocating a meter box and lid, the Contractor shall exercise care in order to avoid damaging the box. In the event the box or lid is damaged in performing the work, the Contractor shall furnish replacements in kind.

670.9-SPECIAL STRUCTURES:

Special structures for waterline appurtenances, such as meter pits, special valve pits, etc., shall be in accordance with the applicable provisions of 605.

670.10

670.10-HOUSE CONNECTION:

The work to be performed under this item shall consist of furnishing and installing all pipe, taps, couplings and fittings necessary to provide a connection from the relocated line to a point where the existing house connection is reconnected. Construction methods shall be as described in 670.4.

670.11-METHOD OF MEASUREMENT:

670.11.1-Water Pipe: Water pipe will be measured by the linear foot in place. The measurement will be made along the centerline of such pipeline, before backfilling, to or from the following described points:

- i. At the centerline of the connection where work begins or ends and connection is made to an existing pipe or special.
- ii. At the centerline of the special casting or connection that is part of the new pipeline.
- iii. At the centerline of a fire hydrant or at the face of a dead plug, dead cap, flange, or spigot at the end of the new pipe line.
- iv. At the ends of new inserted material, where connection is made by breaking and insertion in an existing pipeline. This inserted material, regardless of size, will be considered as being of the same size as the connecting pipe and paid for as such.

No deduction in length will be made for valves or fittings.

670.11.2-Casing Pipe: Casing pipe will be measured by the foot (meter) in place. The measurement will be made along the centerline of each casing pipe installed.

670.11.3-Gate Valve and Valve Box, Fire Hydrants, Meters, Meter Valves and Appurtenances, and Special Structures: These items will be measured by the unit.

670.11.4-House Connections: House connections will be measured per linear foot (meter) of pipe, measured along the centerline, complete in place including all taps and all couplings, goose necks, corporation stops, curb cocks, curb boxes or other material necessary to complete the work.

670.12-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed in 670.13, which prices and payments shall be full compensation for excavation and backfill, except as otherwise provided, testing, disinfecting, thrust blocking, connecting to valves and fire hydrants, all branch connections, fittings, drains, blowoffs

and service connections, reinforcing steel, manhole frame and cover, the repair and repaving of areas not otherwise provided for in the Plans, the removal of all surplus material and clean up, furnishing of all materials and doing all work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

When unsatisfactory foundation materials are encountered at the bottom of the trench, there will be no additional compensation for such excavation and backfill, unless the required excavation and replacement exceeds 1 ft. of depth. Excavation and replacement material in excess of 1 ft., and any special foundation not called for on the Plans will be paid for in accordance with 109.4.

When boring and jacking of casing pipe is specified in the Contract, the cost of the boring and jacking operations will not be paid for separately but shall be included in the unit price bid for the respective casing pipe pay items. If the Engineer determines that field conditions necessitate the boring and jacking of casing pipe not so specified, the casing pipe pay item as originally specified will be non-performed and the cost for such boring and jacking operations, including the cost of the casing pipe, will be paid for in accordance with 109.4.

SECTION 675 SANITARY SEWERS

675.1-DESCRIPTION:

This work shall consist of construction or reconstruction of sanitary sewers and appurtenances in accordance with these Specifications and in reasonably close conformity with the lines, grades, dimensions, and locations shown on the Plans or established by the Engineer.

675.2-MATERIALS:

The material shall meet the requirements of the following subsections.

MATERIAL	SUBSECTION
Plastic Pipe (PVC)	718.5
Ductile Iron Pipe	718.1
Cement Lining	718.1.1
Fittings	718.1.2
Mechanical joints	718.1.3
Push-On Joints	718.1.3

CONSTRUCTION METHODS

675.3-GENERAL:

These Specifications shall apply to the furnishing and installation of all material necessary to complete sanitary sewer relocations and installations in accordance with the Plans.

The Contractor shall furnish all materials, perform all excavation and backfill, construct all necessary joints and connections, construct all appurtenances, install all temporary facilities and dispose of all surplus excavation and discarded material as may be necessary to complete the sanitary sewer relocations and installations.

If the Contractor should observe either proposed or existing sewers or water lines in close proximity the Contractor shall notify the Engineer.

The Engineer will determine if the observed situation lacks conformity to the State Department of Health's Design Standards for Water Distribution Systems, its magnitude and the course of action. Additional costs necessitated by a modification in the plan of construction will be paid for in accordance with 109.4.

The Contractor shall also perform the work of permanently plugging existing sanitary sewers at the locations shown on the Plans or as required due to the field conditions at the time of construction. The plug shall consist of CLSM, type C, or concrete block or brick capped with CLSM, type C, and shall extend a minimum of 1 foot (300 mm) into the existing pipe. The plugging of sanitary sewers, except as provided in 675.16, shall be considered incidental work and its cost shall be included in the unit price bid for sanitary sewer pipe.

The Contractor shall assume all risk and bear any loss or injury to property or persons occasioned by neglect or accident during the progress of the work. The contractor shall make every effort to avoid damaging any existing utility lines or appurtenances.

In the performance of their work, it is of prime importance that the Contractor not disrupt the operation of the existing sanitary sewer facilities in any manner or at any time without the prior written approval of the Engineer. Prior notice shall be given to the Engineer by the Contractor of their intention to begin any work that will disrupt or appreciably alter normal system operation so that the Engineer will have ample opportunity to notify the owner to prepare for any emergency operations that may be required. The Engineer upon advice of the owner will have the sole right of determining at what times and in what order the Contractor shall undertake work involving connections and modifications to the existing system.

The Contractor shall excavate as necessary to determine the number and size of fittings and specials required for connections to existing lines. All material necessary for tie-ins shall be at the work site before discontinuing service. Once the work of connection is begun it shall be continuous until the connection is complete.

675.3.1 - Maintenance of Local Services: The Contractor shall exercise utmost care to avoid damage to trees and hedges, electric, telephone, gas and water lines and other operating sewer lines, buildings, roads and all appurtenances thereto. The interruption of free access to streets, roads and driveways due to trench excavation shall be kept to a minimum. Where possible, a minimum opening of one lane shall be maintained at all times for these appurtenances. All excavated material shall be piled in a manner that will not endanger the work and will not obstruct access to sidewalks and driveways.

Fire hydrants under pressure, valve boxes, service stop boxes, fire and police boxes or other utility controls shall be left unobstructed and accessible. Gutters shall be kept clear or other satisfactory provisions made for drainage. Natural water courses shall not be obstructed. All trenches, material piles, equipment and pipe which may cause a hazard or serve as

obstructions to either vehicular or pedestrian traffic shall be enclosed by fences or barricades, adequately lighted, to protect persons from injury and to avoid property damage. Where traffic must cross open trenches, the Contractor shall provide suitable bridges, which will be subject to approval of the Engineer. The Contractor shall furnish temporary support, adequate protection and maintenance of all underground and surface structures, drains, sewers and other obstructions encountered in the progress of the work.

675.3.2-Removal of Water: The Contractor shall at all times during construction provide proper and satisfactory means and devices for the removal of all water entering the excavated area, and the Contractor shall remove all such water as fast as it may collect to avoid interference with the prosecution of the work or the proper placing of masonry or other materials.

675.3.3-Hauling and Storing Materials: The Contractor shall be responsible for the unloading, storing, hauling and distribution of all material and shall replace at their expense all such material that is damaged, destroyed or lost. All pipe, pipe fittings and accessories shall be handled so as to avoid shock. Pipe having factory applied joint material shall be stacked and blocked to prevent damage to the joint material. Material not needed for immediate use shall be stored in a safe manner at places provided by the Contractor and approved by the Engineer.

675.4-TRENCH EXCAVATION:

675.4. 1 -General: Excavation of the trench may be done either by hand or by the use of suitable trenching equipment.

675.4.2-Trench Width: The width of the trench shall be ample to permit the pipe to be laid and jointed properly, and to permit the backfill to be placed and compacted as specified. Excessive trench widths will not be permitted. Recommended maximum trench widths at top of pipe are given in Table 675.4.2. Where necessary the trench shall be properly and sufficiently sheeted or braced to prevent caving, slipping or cracking of the sides. Where bracing or sheeting is required or extra width is required for handling of specials, the trench shall be of such extra width to accommodate this work.

**TABLE 675.4.2-RECOMMENDED TRENCH WIDTHS
AT TOP OF PIPE**

Pipe Diameter Inches (mm)	Trench Width Inches (mm)
6 (150)	21 (525)
8 (200)	24 (600)
10 (250)	27 (675)
12 (300)	30 (750)
15 (375)	33 (825)
18 (450)	36 (900)
21 (525)	42 (1 050)
24 (600)	45 (1 125)
27 (675)	48 (1 200)
30 (750)	54 (1 350)
33 (825)	57 (1 425)
36 (900)	60 (1 500)

675.4.3-Blasting: Blasting for excavation will be performed only after securing the approval of the Engineer and only when proper precautions are taken for the protection of persons or property. The Engineer will set the hours of blasting. The Contractor at his expense shall repair any damage caused by blasting.

675.5-BEDDING:

675.5. 1 -General: Bedding of the pipe shall conform to class 'B' as follows:

The trench shall be excavated to a depth that will provide a granular bed of at least 4 inches (100 mm) or the pipe diameter divided by four, whichever is greater, below the pipe in soil. The trench shall then be backfilled with bedding material. The granular bed shall be extended to the spring line of the pipe.

The pipe shall be bedded in suitable material of uniform density. Fine aggregate shall be used to level the foundation.

675.5.2-Unstable Foundation: Where the bottom of the trench at grade is found to be unstable or include ashes, cinders, all types of refuse, vegetable or other organic material, the Contractor shall excavate and remove such unsuitable material to the width and depth ordered by the Engineer. The trench shall be backfilled to the proper grade, in 6 inch (150 mm) loose layers, with suitable earth or granular material from unclassified excavation. Each layer shall be thoroughly compacted in accordance with 675.10, and the bedding shall be in accordance with 675.5.1.

675.5.3

There will be no additional compensation for such excavation and backfill, unless the required excavation and replacement exceeds 1 ft. in depth. Excavation and replacement material in excess of 1 ft. in depth will be paid for in accordance with 109.4.

Where the bottom of trench at grade is found to consist of material which is unstable to such a degree that, in the opinion of the Engineer, it cannot be removed and replaced with material suitable to support the pipe properly, the Contractor shall construct a foundation for the pipe, consisting of concrete, pilings or other materials or as directed by the Engineer. A special foundation, if not called for on the Plans, will be paid for in accordance with 109.4.

675.5.3-Rock Foundation: Where rock (or boulders) is encountered, the rock shall be removed to provide a clearance, below and on each side of all pipe, fittings and appurtenances, of at least 6 inches (150 mm) for pipe 24 inches (600 mm) in diameter or smaller and at least 9 inches (225 mm) for pipe larger than 24 inches (600 mm) in diameter. The trench shall be backfilled to invert grade with bedding material in 4 in. (100 mm) loose layers. Each layer shall be thoroughly compacted in accordance with 675.10, and the bedding shall be in accordance with 675.5. 1.

675.6-PIPE LAYING:

Proper implements, tools and facilities satisfactory to the Engineer shall be provided and used for the safe and convenient prosecution of the work. Line and grade of the pipeline shall be maintained and checked by use of laser beam. For relocation's less than 100 ft (30 m) batter boards, grade line and grade rods or methods of equivalent accuracy may be utilized. Batter boards for gravity sewers shall be set at intervals of not greater than 25 ft. Pipe shall be laid from the lowest point upgrade with the spigot or tongue ends pointing downgrade in the direction of flow.

All pipe, fittings and appurtenances shall be carefully lowered into the trench, piece by piece, by means of a derrick, ropes or other suitable tools or equipment in such a manner as to prevent damage to the sewer line materials, protective coating, and linings. Under no circumstances shall sewer line materials be dropped or dumped into the trench.

All pipe and fittings shall be carefully examined for defects and no pipe or fitting shall be laid which is known to be defective. Any defective, damaged or unsound pipe will be rejected. If any defective piece is discovered after laying, it shall be removed and replaced at the Contractor's expense. All pipes and fittings shall be cleaned before they are laid and shall be kept clean until accepted in the completed work.

The pipe shall be supported its full length by the uniform grade of the trench. Pipe ends shall not be left open at the end of a day's work or during temporary suspension of construction, but shall be securely covered to prevent the entry of foreign matter or animals.

When cutting short lengths of ductile iron pipe, a pipe cutter shall be used and care shall be taken to make the cut at right angles to the centerline

of the pipe. For "push-on" pipe, the cut ends shall be tapered with a portable grinder or coarse file to match the manufactured taper. Plastic pipe may be sawed.

675.7-JOINTING:

Jointing of all pipes is to be preformed in accordance with the manufacturers recommendations.

675.8-CASING PIPE:

Construction methods shall conform to the applicable requirements of the Specification, except that in the event that boring and jacking methods are specified in the Contract or are otherwise necessary to complete the installation, the applicable provisions of 604.11 shall govern.

Damaged coating on the outside of the pipe shall be repaired by hand brushing a thick coat of the same type as the original coating material when placed by open trench construction; outside repair coating is waived for casing pipe to be placed by boring and jacking operations. Inside coating damage shall be repaired, as specified above, for all pipe except as limited by inaccessibility to damage areas for small diameter casing pipe.

675.9-THRUST BLOCKING AND ANCHORAGE:

Thrust blocking or anchorage of sewer force main as shown on the Plans shall be constructed in accordance with 670.4.3 and 670.4.4.

675.10-BACKFILLING:

Backfilling shall be in accordance with 670.4.5

675.11-TESTING INSTALLATIONS:

Exfiltration or air tests shall be made on all sections of new gravity sewer extending from manhole to manhole. New installations that become a part of an existing line and testing is not practical then testing shall not be required. All pressure lines shall be subjected to a pressure test at the pressure shown on the Plans. An infiltration test shall be made only when called for on the Plans. All new manholes shall be tested.

In the event the allowable test rates are exceeded, the Contractor shall determine the location of the leaks and shall repair the sewer or manholes, or both, in a manner satisfactory to the Engineer. The sewer line shall be retested until the leakage in the sewer is within the allowable limits. The Contractor shall include in the unit bid price the cost of all bulkheads, plugs, pipe stoppers, pumps, water, weirs, labor, delay and any other items of cost necessary for the performance and completion of the required tests and for the cost of any repairs or adjustments which may be necessary to make the installations conform to the required allowable leakage rates.

All leakage tests shall be conducted under the observation of the Engineer or representative.

675.11.1

675.11.1-Exfiltration Testing: In conducting the exfiltration test, the line shall be plugged in the lower manhole and filled with water until the water level in the upper manhole is 2 feet (600 mm) above the top of the pipe. The line shall then be left for a period of two hours to allow for absorption of water into pipes and structures, after which it shall be refilled to the specified height and the test begun. Readings shall be taken on the level of the water at one hour intervals, the manhole refilled to an elevation of 2 feet (600 mm) above the top of the pipe and the amount of replacement water recorded. Duration of the test shall be four hours, and the allowable exfiltration shall not exceed that shown in Formula 675.11.1.

Pressure tests for force mains (sewers under pressure) shall be performed in accordance with [670.4.6](#).

EQUATION 675.11.1-ALLOWABLE LOSS RATE

(Based on Loss Rate of 500 Gal. per Inch Diameter per One Mile per 24 Hours)

{ENGLISH}

$$\text{Loss} = 0.00158 (D)L$$

Where: Loss = Gallons per Hour

D = Nominal diameter of the pipe in inches

L = Length of pipe in feet

{METRIC}

$$\text{Loss} = 0.000792 (D)L$$

Where: Loss = Liters per Hour

D = Nominal Diameter in Millimeters

L = Length of pipe in Meters

675.11.2-Infiltration Testing: The infiltration test shall be made by installing a weir or other measuring device approved by the Engineer in the lower end of the sewer section to be tested. The incoming sewer or sewers in the upper end of the test section shall be securely sealed. The quantity of ground water infiltration into the test section shall be measured and shall not exceed that shown in Equation 675.11.1

675.11.3-Low Pressure Air Testing: Low pressure air test conforming to these specifications shall be conducted between consecutive manholes. All Wye branches in the test section shall be plugged. The duration of the test shall be as shown in Table 675.11.3.

The drop in pressure during the prescribed test time shall not exceed 1.0 psi, from 3.5 psi to 2.5 psi testing pressure. A drop below 2.5 psi shall be indication of a failure in the section being tested.

TABLE 675.11.3 – AIR TEST TABLE

Time required for a 1.0 PSI (6.9 kPa) pressure drop.

The required test time shall be the minimum test time or test Duration whichever is greater.

Pipe Diameter inches (mm)	Minimum Test Time Min:Sec	{English} Test Duration L = Feet Sec	{Metric} Test Duration L= Meters Sec
4 (100)	3:46	.380 L	1.246 L
6 (150)	5:40	.854 L	2.802 L
8 (200)	7:34	1.520 L	4.986 L
10 (250)	9:26	2.374 L	7.788 L
12 (300)	11:20	3.418 L	11.21 L
15 (375)	14:10	5.342 L	17.53 L
18 (450)	17:00	7.692 L	25.24 L
21 (525)	19:50	10.470 L	34.35 L
24 (600)	22:40	13.670 L	44.86 L

For sewers 30 inches (750 mm) and greater in diameter, joint testing is an acceptable method of testing. Joint testing shall be accomplished by isolating each joint and applying low pressure air. The line shall be acceptable if each joint passes the air test. The joint will be considered acceptable if the air pressure being applied to the joint drops less than 1 psi (7 kPa) in three minutes. The air pressure applied shall be 4 psi (27.6 kPa) over and above the groundwater back pressure. Groundwater shall be compensated by increasing the 4 psi (27.6 kPa) test pressure by 0.433 psi (9.8 kPa) for each foot (meter) of groundwater. It is the Contractor's responsibility to determine the groundwater level.

675.11.3.1 - Safety Precautions During Air Testing: The pressurizing equipment shall include a regulator set at 10 psi (69 kPa) to avoid over pressurizing and damaging an otherwise acceptable line. No one shall be allowed in the manhole during testing.

675.11.4-Manhole Testing: The test shall consist of plugging all inlets and outlets and filling the manhole with water to a height determined by the Engineer. Leakage in each manhole shall not exceed 0.2 gallons per hour per foot (2.48 liters per meter) of head above the invert. A manhole may be filled 24 hours prior to time of testing, if desired, to permit normal absorption into the pipe walls to take place. Repair all manholes that do not meet the leakage test, or are unsatisfactory from visual inspection, to conform to the requirements herein.

The Contractor may request to test manholes for leakage by the vacuum testing procedure developed by Perer A.Glazier and Associates of Worcester, Massachusetts, 01603. This test shall not be used until the

Engineer has given written approval. The Engineer reserves the right to refuse to permit this procedure or to place any condition upon the procedure he deems appropriate.

675.12-RECONSTRUCTED SANITARY SEWER:

Sections of existing sanitary sewers so specified shall be removed and replaced in the same locations. The reconstructed sewer shall be of the type and size as shown on the Plans and shall be laid on a uniform grade between points of removal.

Construction methods shall conform to the applicable requirements of this Specification. Tests shall be performed as set forth in 675.11.

This work shall also include construction and maintenance of temporary lines, as required, to avoid disrupting operation of the existing sanitary sewer system. Temporary service may be maintained by use of pumps and hose lines or in any other manner satisfactory to the Engineer.

675.13-MANHOLE:

Construction of manholes shall conform to the applicable requirements of 605.

675.14-ABANDONING MANHOLES:

Upon completion of the new gravity sewer and placing it in service, or upon abandonment of an existing sewer line, the existing manholes to be abandoned shall be cut down to 2 feet (600 mm) below the proposed finished grade, the inlet and outlet ends of existing pipe plugged with CLSM, Type C, and the manhole backfilled to subgrade elevation with material from the unclassified excavation and compacted.

675.15-ADJUSTING MANHOLES:

Construction methods shall conform to the applicable requirements of Section 605.

675.16-CAPPING MANHOLES:

The existing manhole shall be removed to a minimum depth of 15 ft (450 mm) below the subgrade elevation. Permanent forms of sheet or corrugated sheet steel shall be used to form over the manhole opening. Side forms may be undisturbed earth. No form work shall be placed inside the manhole which will interfere with the flow of the existing sewer. Steel shall be set and the cap poured to Plan dimensions. No finish is required.

675.17 - JUNCTION BOXES:

Construction methods for junction boxes shall conform to the applicable requirements of Section 605.

675.18-METHOD OF MEASUREMENT:

675.18. 1 -Sanitary Sewer Pipe: Pipe of the different types and sizes, both new and reconstructed, will be measured by the linear foot (meter) in place. Measurement will be made along the centerline of each pipe installed. Branch connections, valves, tees, wyes, and elbows will be measured along their centerlines and these lengths included in the total lengths of the appropriate conduit. Wyes, tees, and other branch connections will be measured along the centerlines to points of intersection. Pipe with sloped or skewed ends will be measured along the longitudinal axis through the center of the pipe. The portion of pipe extending through to the inside face of manholes, boxes, or other structures will be included in the measurement.

675.18.2-Manholes: Manholes will be measured as a complete unit in place, including frame, cover and cover castings.

675.18.3-Abandoning Manholes, Adjusting Manholes and Capping Manholes:

"Abandoning Manhole", "Adjusting Manhole", and "Capping Manhole" will be measured as a complete unit in place.

675.18.4-Junction Boxes: "Junction Box" will be measured as a complete unit in place, including, if called for, manhole frame and cover casting (ring type).

675.18.5-Steel Casing Pipe: Steel casing pipe will be measured by the linear foot (meter) complete in place.

675.19-BASIS OF PAYMENT:

The quantities, determined as provided above, will be paid for at the contract unit price bid for the items listed below, which prices and payments shall be full compensation for excavation and bedding, except as otherwise provided. Backfilling, testing, construction and maintenance of temporary service when required, repair and repaving of areas not otherwise provided for in the contract, removal of surplus material and clean-up, furnishing all materials and doing all the work prescribed in a workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete work.

When boring and jacking of casing pipe is specified in the Contract, the cost of the boring and jacking operations will not be paid for separately but shall be included in the unit price bid for the respective casing pipe pay items. If the Engineer determines that field conditions necessitate the boring and jacking of casing pipe not so specified, the casing pipe pay item as originally specified will be non-performed and the cost for such boring and jacking operations, including the cost of casing pipe, will be paid for in accordance with [109.4](#)

675.20-PAY ITEMS:

SECTION 688

PAINTING STEEL STRUCTURES

688.1-DESCRIPTION:

Painting of metal shall include, unless otherwise specified in the Contract, the preparation of the metal surfaces, the procurement of all materials to meet the necessary specifications and the application of coating. This section shall apply to shop painting of new structures, field painting of new and existing structures.

688.2-SHOP PAINTING:

688.2.1-Description: The fabricator shall submit through the Prime Contractor to the Division their quality control plan for painting. The plan must be accepted prior to painting. The minimum requirements for the plan are set forth in MP 688.02.20.

688.2.2-Materials: The primer shall meet the requirements of 711.6 or 711.20.2.

688.2.3-Weather Conditions: Painting shall not be done when the ambient temperature is below 40° F (5° C) or the relative humidity above 90 percent, except as follows. If it is established that no detrimental effect to the paint film takes place, ambient temperature requirements may be lowered and relative humidity requirements may be raised at the option of the Engineer, however, the temperature of the steel must be at least 5° F (3° C) above the dew point. Painting shall not be performed when the surface to be coated is sufficiently hot to cause blistering of the film or too rapid solvent release.

688.2.4-Surface Preparation: All structural steel surfaces shall receive a very thorough blast SSPC-SP-10 (near white) cleaning prior to painting. Structural steel which has rusted to rust grade D of SSPC-Vis 1 shall not be used. The appearance of the steel surface after blast cleaning shall correspond with the following pictorial standards: A SP-10, B SP-10, or C SP-10 of SSPC Vis 1. In the event the coating manufacturer recommends a white metal finish, the appearance of the steel surface shall correspond to one of the following pictorial standards: A SP-5, B SP-5, or C SP-5, of SSPC-Vis 1.

688.2.4.1-Abrasives: The abrasives used shall meet the guidelines set forth in SSPC - Surface Preparation Commentary. Any additive mixed with the abrasive shall be approved prior to use.

688.2.4.2-Surface Profile: The abrasives used shall produce a height of profile between 1.0 and 3.0 mils (25 mm and 75 mm).

688.2.4.3-Cleaning Sequence: The cleaning sequence shall be as follows:

- I. Deposits of oil or grease shall be removed by the methods outlined in SSPC-SP-1, "Solvent Cleaning".
- II. Excessive rust-scale may be removed as outlined in SSPC-SP-2, "Hand Tool Cleaning," SSPC-SP-3, "Power Tool Cleaning", or by special blast cleaning equipment prior to normal blasting operations.
- III. The surface of the metal shall be blast cleaned to the specified finish by any of the following methods:
 - a. Dry sandblasting, using compressed air blast nozzles and dry sand.
 - b. Grit blasting, using compressed air blast nozzles or centrifugal wheels, and crushed grit made of cast iron, malleable iron, steel or synthetic grit.
 - c. Shot blasting using compressed air blast nozzles or centrifugal wheels, and cast iron, malleable iron, steel or synthetic shot.
 - d. Closed, recirculating nozzle blasting, using compressed air and vacuum, and any of the preceding abrasives.
- IV. The surface, if dry blasted, shall be brushed with a clean brush made of hair, bristle, or fibers, or shall be blown off with compressed air (from which detrimental oil and water have been removed), or shall be cleaned by vacuum for the purpose of removing any traces of blast products from the surface and also for the removal of abrasives from pockets and corners.
- V. The blast cleaned surface shall be examined for any traces of oil, grease or smudges. If present, they shall be removed as outlined in SSPC-SP-1, "Solvent Cleaning".

688.2.4.4-General: The compressed air used for nozzle blasting shall be free of detrimental amounts of water or oil. Blast cleaning operations shall be done in such a manner that no damage is done to partially or entirely complete portions of the work. After blast cleaning, any areas which are repaired by welding shall be blast cleaned. Areas repaired by grinding or other means may have the anchor pattern restored by blast cleaning, or as directed by the Engineer.

688.2.5-Paint Application Requirements: The shop primer shall be applied in accordance with SSPC Paint Application 1 (PA 1). The blast cleaned surface shall be painted within 24 hours. In the event rust bloom or flash rusting occurs the effected members shall be recleaned by blasting. The paint shall be applied by spray methods except those areas inaccessible to spray

application may be brushed. Small touch-up areas may be brushed, if approved by the Engineer.

Use of an agitated pot shall be mandatory in all spray or brush application of the paint. The agitator or stirring rod shall reach to within 1 in. (25 mm) of the bottom of the pot and shall be in motion at all times during paint application.

Brushes, when used, shall have sufficient body and length of bristle to spread a uniform coat.

The dry film thickness of the shop coat shall be minimum of three mils (75 μ m), except field and shop bolted contact surfaces which shall be as follows:

Minimum thickness shall be two mils (50 μ m).

Maximum thickness shall be five mils (125 μ m).

All edges, corners, crevices, and welds shall be stripe painted in accordance with SSPC-PA-1.

Under certain conditions, it may be necessary to thin or adjust the solvent balance of the paint. The type and amount of solvent to be used shall be that recommended by the coating manufacturer. Regardless of the thinning done, the dry film thickness requirement shall be met.

If in the opinion of the Engineer the coat has flaws other than deficiency in the prescribed dry film thickness, the material shall be repaired or shall be removed and replaced. If less than the prescribed dry film thickness has been applied, further application shall be made until the proper dry thickness is obtained.

Machine finished surfaces shall be coated as soon as practicable with a coating approved by the Engineer.

Top flanges that will be encased in concrete shall be coated to a minimum dry film thickness of two mils (50 μ m). Shear studs may be applied in the shop or in the field. If applied in the shop, the studs shall be installed prior to painting. Painting of studs is not required. If installed in the field, the shop applied paint on the top of the top flange shall be removed at the stud locations to bare metal prior to installation of the studs.

All areas which will be inaccessible after assembly, shall be painted with the total paint system in the fabrication shop. Exposed steel surfaces of expansion dams shall be painted as specified for structural steel. Erection weight and match marks shall be stenciled or painted on structural steel after the prime coat is applied. Surfaces of steel within 2 inches (50 mm) of edges to be field welded shall not be painted in the shop.

688.2.6-Inspection of Applied Paint: No unsightly runs or sags shall be visible. All "mud-cracking" and/or "dryoverspray" in the paint film shall be removed. When examined under 8X magnification, excessive bubbles or pin holes shall not be visible in the coat. Calibration of the thickness gage and dry film thickness measurements shall be in accordance with MP 708.40.00.

688.2.7-Handling Coated Steel: Extreme care shall be exercised in handling the steel in the shop, during shipping, erection, and subsequent construction of the bridge. Painted steel shall not be moved or handled until sufficient cure time has elapsed to insure no damage is done to the fresh coating. The steel shall be insulated from the binding chains by softeners. Hooks and slings used to hoist steel shall be padded. To prevent damage to the coating, diaphragms and similar pieces shall be spaced in such a way that no rubbing will occur during shipment. All shipping and job site storage and handling details shall be submitted to the Engineer and must be approved prior to shipping any steel.

688.2.8-Shop and Field Repair: All shop and field repairs to the coating shall be made in strict accordance with the coating manufacturer's recommendation except where the requirements listed in this specification are more stringent. All procedures for shop and field repairs shall be submitted for approval by the Engineer prior to repair. Surfaces which will be inaccessible for coating after erection shall be repaired and/or recoated prior to erection.

The requirements specified herein for provisions for inspection, mixing, thinning, temperature and humidity, and application shall govern the coating of the repaired areas. In order to avoid abrupt changes in paint thickness, the area adjacent to repair areas shall transition from zero paint thickness to full system thickness within not less than 3 inches (75 mm) of the repair area by means of sanding the transition area. The requirements for the dry film thickness of the repair coats are the same as for the shop coats.

When the field painting is not included in the erection contract the heads of bolts and nuts shall be blast cleaned and painted in accordance with 688.2.4 and 688.2.5.

Blast cleaning and application of shop primer shall not be required for mechanically galvanized or zinc rich painted bolts, nuts and washers. All welds and surfaces from which the shop coat of paint has been damaged or is otherwise defective shall be blast cleaned and painted in accordance with 688.2.4 and 688.2.5.

688.2.9-No Top Coat Paint System: Structures which will not be topcoated in the field shall meet all the requirements of Section 688.1 except the dry film thickness shall be a minimum of 4 mils (100 μ m). In addition, the Contractor shall provide the inspection access and surface protection required in Section 688.3.2.6. All edges, corners, crevices, and welds shall be stripe painted in accordance with SSPC-PA-1. The repair procedures of Section 688.2.8 shall apply.

In order to keep uniformity in the color of the structure, all paint applications will require the use of the same product formulation. The color shall be green.

688.3-FIELD PAINTING:

688.3.1-General Conditions: Field painting of new structures shall include, unless otherwise specified in the contract, the preparation of the primed surface for painting, the procurement of all materials to meet the necessary specifications and the application of the coatings. In addition, the Contractor shall protect pedestrian, vehicular, and other traffic on or underneath the structure from splattering, splashing, or dripping paint. Railings, curbs and all other superstructure and substructure shall be protected against spatters, splashes, and the like. Painting of existing structures shall consist of either removal of existing coatings and complete repainting or spot cleaning and painting as called for on the Plans.

The minimum requirements for the containment/disposal plan are set forth in MP 688.03.20. When lead based paint, as defined below, is to be removed the following apply:

- A. The installation, cleaning, maintaining, and removal of pollution control devices.
- B. The collection and transporting of "spent material" resulting from the cleaning operation to an approved storage area.
- C. The transporting of "spent material" to a disposal site as outlined in these specifications. "Spent Material" shall be defined as rust particles, paint particles, dust and/or debris resulting from the cleaning of steel bridges that have been coated with lead based paint.

Lead based paint is defined in 29CFR 1303 as a paint or other similar surface coating material containing lead or lead compounds and in which the lead content is in excess of 0.06% lead by weight of the dried film.

688.3.2-New Structures:

688.3.2.1 – Materials: The field coats of paint shall meet the requirements of 711.20.3 and 711.20.4 or 711.22.3 and 711.22.4. The total thickness of the field coats shall be a minimum of 3 mils (75 µm) dry for the 711.20 system and 4 mils (100 µm) dry for the 711.22 system.

688.3.2.2-Environmental Protection: Surface cleaning materials, removed paint, rust, other wastes, and painting application overspray, drips, and the like shall be contained. The containment class, assessment method and level of assessment as defined in the SSPC X6X shall be as stated on the project plans.

688.3.2.3-Weather Conditions: Shall meet the requirements of Section 688.2.3.

688.3.2.4-Surface Preparation: : Prior to topcoating, surface contamination such as rust, dirt, mud, oil, concrete, loose zinc salts, or other foreign matter shall be removed. The entire structure shall be pressure washed at 2000 – 3000 psi (13800 – 20700 kpa). All areas including black bolts, nuts, and washers, not primed shall be cleaned and painted in accordance with Section 688.2.4 and 688.2.5. All damaged areas of the primer shall be

688.3.2.5

repainted in accordance with the manufacturer's recommendation. The damage repair primer shall be from the same manufacturer as the shop primer.

688.3.2.5-Paint Application Requirements: At this time, all adjoining concrete work shall be finished and the primer repaired to the satisfaction of the Engineer. Use of an agitated pot shall be mandatory in all spray or brush application of the paint. The agitator or stirring rod shall reach to within 1 in. (25 mm) of the bottom of the pot and shall be in motion at all times during paint application.

The field coats of paint shall be applied in accordance with SSPC-PA 1.

688.3.2.6-Inspection: The Contractor shall furnish suitable access and shall provide a time mutually agreed to for inspecting the structural steel prior to and after coating. The inspector shall approve all repairs. When providing suitable access, rubber rollers or other protective devices shall be used. Metal rollers or clamps and other types of fastenings which will mar or damage freshly coated surfaces shall not be used. Any temporary attachments or supports for access or forms shall not damage the coating system. (In particular, on the fascias where bracing is used sufficient size support pads must be provided). Any damage that occurs from such devices shall be repaired. The inspection shall be in accordance with Section 688.2.6. In addition, the field intercoat adhesion shall be at least 3A when tested in accordance with MP 711.00.20.

688.3.3-Existing Structures:

688.3.3.1-Material: The field coats of paint shall meet the requirements of Section 711. The applicable sections of 711, the dry film thickness and the color shall be as specified in the contract documents.

688.3.3.2-Weather Conditions: Shall meet the requirements of Section 688.2.3.

688.3.3.3-Surface Preparation: The surface shall be prepared as specified in the contract documents. Specific instructions will be given on the amount of surface required to be blast cleaned. The remainder may be removed by non blast cleaning. It is intended that sound, adherent old paint not be removed unless it is excessively thick or inflexible. In preparing a previously painted surface, all corrosion and all paint which shows evidence of corrosion, peeling, excessive thickness, brittleness, blistering, checking, scaling, or general disintegration shall be removed. It is essential that the removal of the old paint be carried back around the edges of the spot or area until an area of completely intact and adhering paint film, with no rust or blisters underneath, is attained. Edges of tightly adherent paint remaining around the area to be recoated shall be feathered so that the repainted surface can have a smooth appearance. The remaining old paint shall have sufficient adhesion so that it cannot be lifted as a layer by inserting a blade of a putty knife under it or be removed by wire

brushing or light scraping. The rate of cleaning may vary from one area to the next in order to achieve the desired end condition.

688.3.3.3.1-Near White (SSPC-SP-10): Shall meet the requirements of Section 688.2.4, except rust grade D steel may be cleaned. If rust grade D steel is present, the blast cleaned surface shall correspond to pictorial standard D SP 10 of SSPC V1S 1.

688.3.3.3.2-Commercial (SSPC-SP-6): Shall meet the requirements of Section 688.3.3.3.1 except the blast cleaned surface shall correspond to pictorial standards, B SP 6, C SP 6, or D SP 6 of SSPC V1S 1.

688.3.3.3.3-Non Blast Cleaning: When blast cleaning is not specified in the contract documents, any one or a combination of the following methods may be used. The surface after cleaning shall meet the requirements of the method.

Hand Clean	SSPC-SP-2
Power Tool	SSPC-SP-3
Brush off Blast	SSPC-SP-7
Power Tool to Bare Metal	SSPC-SP-11

The profile after nonblast cleaning shall be as described in the method. The amount and type of material removed shall be as defined in the method.

688.3.3.4-Abrasives: The abrasives shall meet the requirements of 688.2.4.1. In addition, the container or bag or abrasive shall include the name of the abrasive, the name of the manufacturer, and the size of the abrasive. If any additive has been included with the abrasive, the name and the percentage of the additive shall be on the container or bag.

688.3.3.5-Coating Application: The field paint shall be applied in accordance with SSPC-PA-1. In addition, the use of an agitated pot shall be mandatory in all brush and spray applications of the paint. The agitator or stirring rod shall reach to within 1 in. (25 mm) of the bottom of the pot and shall be in motion at all times during the paint application.

All edges, corners, crevices, and welds shall be stripe painted in accordance with SSPC-PA-1.

Any caulking shall be applied after the full prime coat has thoroughly dried and before application of the intermediate coat. The caulking material shall be compatible with the paint system being applied and shall be as recommended by the paint manufacturer. Caulking operations shall be preformed only when weather conditions are within the parameters as specified in Subsection 688.2.3.

688.3.3.6-Environmental Protection Environmental protection shall be used when cleaning, painting, welding or cutting an existing bridge that has

688.3.3.6

a coating containing lead base paint. The Containment Class, Assessment method, and level of assessment as defined in SSPC X6X shall be as stated on the project plans. Prior to beginning work. The Contractor shall provide a containment/disposal control plan in accordance with M.P. 688.03.20. The specific pollution control system which is proposed for the complete capture, containment, collection, and disposal of the "spent material" generated by the work shall be included in the plan. This work shall be performed in compliance with West Virginia Division of Environmental Protection (DEP), United States Environmental Protection Agency (EPA), Occupational Safety & Health Act (OSHA), United States Coast Guard (USCG), SSPC Guides X6X and X7X, WVDOH Best Management Practice For Containment/Disposal, and other regulatory agencies' rules, regulations, standards, and guidelines in effect at the time the work is in progress. Upon approval, the plan shall be implemented to capture, contain, collect, and dispose of all "spent material".

The Contractor shall obtain all documents and/or permits that are required for the handling and disposal of the "spent material" collected during the course of the work. All material shall be disposed of at an approved site(s) by the Contractor or his authorized representative. The Contractor shall present the proper documentation and/or permits, as part of the pollution control plan, demonstrating that he has made arrangements to dispose of the materials at an approved disposal site. The Contractor shall not begin cleaning or blasting until he has submitted final documentation that he has an approved disposal site and all documents and/or permits for the handling, storing, and transporting of hazardous water and nonhazardous waste.

The "spent material" shall be collected and stored in containers lined with impervious plastic. The containers shall be locked or secured by a fence and kept covered with waterproof covers. The contents shall not be disposed of until authorized by the Engineer.

The "spent material" collected and stored in the containers shall be sampled and tested in accordance with MP 688.03.21. The "spent material" shall be tested in accordance with MP 688.03.22 to determine if the "spent material" is classified as hazardous. Current DNR methods are defined as those in effect at the time the project is advertised. The Contractor shall, at the Contractor's expense, select a laboratory that will sample and analyze the "spent materials".

The laboratory will be approved by the Division as per MP 688.03.23. The Division of Highways will have a person who has been trained in sampling present during the sampling process. The results of the tests shall be provided to the Division within five working days of the sampling.

The Division may take independent samples, split samples with the Contractor's testing laboratory, and/or witness testing at its discretion. If the test results do not classify the "spent material" as hazardous waste, the Contractor shall transport and dispose of it at a landfill that has DEP approval to accept such waste. The Contractor shall be responsible for locating an approved landfill and obtaining all documents and/or permits for transporting disposal.

If the "spent material" is classified as hazardous waste the Division of

Highways shall obtain a provisional EPA generator number in accordance with all applicable Federal and State regulations. The Contractor shall containerize, mark and label all hazardous waste materials in accordance with 40 CFR 260 through 263.

The Contractor shall secure a transporter that meets all State and Federal requirements and a properly permitted disposal facility. The Contractor will be responsible for obtaining the EPA uniform hazardous waste manifest from the state that will be receiving the hazardous waste materials. All EPA uniform hazardous waste manifests will be signed by a Division of Highways official. Hazardous waste shall be removed within 90 days if the total weight exceeds 2,240 pounds (1000 kg). Prior to any shipments all containers and vehicles will be inspected by the Division of Highways person who is trained in the area of hazardous waste transportation.

688.3.3.7-Worker Protection: The Contractor shall provide protection for their Workers as per the requirements of 29 CFR 1926.62. The Contractor shall have a certified industrial hygienist (CIH) review and approve their written compliance plan. The CIH shall be certified by the American Board of Industrial Hygiene. The CIH shall be present during the first week of the work and at least twice a month thereafter. The CIH shall certify in writing during the first week of the work and at the end of the work that the worker protection plan fully complied with all regulations and that the plans were fully implemented.

688.4-METHOD OF MEASUREMENT:

The unit of measurement for "Cleaning and Painting Existing Steel Bridges" or "Cleaning and Painting Existing Steel Bridges Coated with Lead Based Paint" shall be lump sum. The unit of measurement for "Containment and Disposal of Spent Material" shall be lump sum.

688.5-BASIS OF PAYMENT:

Basis of payment for "Cleaning and Painting Existing Steel Bridges" or "Cleaning and Painting Existing Steel Bridges Coated with Lead Based Paint", or "Containment and Disposal of Spent Material" shall be lump sum price bid for the items listed below, which price and payment shall be full compensation for furnishing all the materials and doing all the work herein prescribed in workmanlike and acceptable manner, including all labor, tools, equipment, supplies, and incidentals necessary to complete the work.

688.6-PAY ITEMS:

ITEM	DESCRIPTION	UNIT
688001-*	CLEAN AND PAINT EXISTING STEEL BRIDGE	LUMP SUM
688002-*	CLEAN AND PAINT EXISTING STEEL BRIDGE COATED WITH LEAD BASE PAINT	LUMP SUM
688003-*	CONTAINMENT AND DISPOSAL OF SPENT ATERIAL	LUMP SUM

* Sequence Number

SECTION 689

METALIZING STEEL

689.1 - DESCRIPTION:

This specification covers the requirements for thermal spray metallic coatings, with or without sealers or top coats, as a means to prevent corrosion of steel surfaces.

All work shall be done at the steel fabrication shop unless otherwise specified.

The requirements outlined in the Society of Protective Coatings Guide for “Thermal Spray Metallic Coating Systems” (SSPC CS-Guide 23.00) shall be followed and considered as part of this specification.

689.2 - MINIMUM REQUIREMENTS:

All metalizing work shall be performed by a company with at least three years of experience in coating steel. Any company which is new to metalizing and does not have three years experience shall, prior to starting any work, submit written documentation of successful structural steel metalizing projects. This shall include the name of the owner of previous projects, number and location of jobs completed, and number of years experience. This document will be reviewed, verified, and approved by the Engineer prior to beginning any work. The company shall possess knowledge and experience in all areas of surface preparation and metalizing work.

Each spray operator shall be qualified to metalize in conformance with the latest edition of ANSI/AWS C2.18. Spray operators not having evidence of qualification shall be prohibited from spraying.

689.3 - MATERIAL:

Unless otherwise specified, the metallic coating to be applied shall be pure zinc, conforming to the requirements of ASTM B6.

The manufacturer shall furnish a Certificate of Analysis for each lot of material supplied. Each container or coil reel shall be properly labeled to identify component type, supplier, size, and wire lot number.

The size of wire material shall conform to the manufacturer's recommendations for the Arc Sprayed method.

The metalizing material shall satisfy the requirements for at least a Class B slip coefficient and creep resistant per Appendix A of the “Specification for Structural Joints Using ASTM A 325 or A 490 Bolts” by the Research Council on Structural Connections. The test results shall be provided to the Engineer by the contractor prior to the start of work.

689.4 - APPLICATION OF METALLIC COATING:

The metalizing unit shall be an arc type gun manufactured by an established domestic company. The equipment shall be used in conformance with the manufacturer's recommendations. No surface shall be sprayed which shows

any signs of rust, scale or moisture. All metalizing shall be applied at 8 - 14 mils (200 - 350 μm) with no individual reading less than 6 mils (150 μm) nor more than 16 mils (400 μm). At least one layer of coating shall be applied within four hours after blasting and the final thickness within a maximum of eight hours of the blasting.

The top flange which will require shear studs shall have the metalizing applied at a minimum of 2 mils (50 μm) in order to prevent rusting. If applied in the shop, the studs shall be installed prior to metalizing. Metalizing of the studs is not required. If installed in the field, the shop applied metalizing on the top of the top flange shall be removed at the stud locations to bare metal prior to installation of the studs.

The contractor shall provide facilities to protect the finished metalized surface from damage during the blasting and thermal spraying work operations on adjacent areas. All damaged coated areas shall be properly repaired and remetalized at no additional cost to the Division.

Surfaces not intended to be metalized shall be suitably protected from the effects of the metalizing operations.

689.5 - SEALERS AND TOP COATS:

The Division has the option of requiring a sealer and/or top coats over the metalizing. When this option is chosen, the requirements will be specified in the contract documents.

689.6 - SHIPPING AND HANDLING:

All fully coated and cured assemblies shall be protected from handling and shipping damage with the prudent use of padded slings, dunnage, separators and tie downs. Loading procedures and sequences shall be designed to protect all coated surfaces. Any damaged areas shall be repaired in conformance with the manufacturer's recommendations or as directed by the Engineer.

689.7 - FIELD TOUCH UP:

All touch up for metalizing shall be in conformance with the coaters recommendations.

689.8

689.8 - METHOD OF MEASUREMENT:

The unit of measurement for “Metalizing Steel” shall be lump sum.

689.9 - BASIS OF PAYMENT:

Basis of payment for “Metalizing Steel” shall be lump sum. Payment shall be full compensation for furnishing all the labor, tools, equipment, supplies, and incidentals necessary to complete the work herein prescribed.

689.10 - PAY ITEMS:

ITEM	DESCRIPTION	UNIT
689001-*	METALIZING STEEL	LUMP SUM
689002-*	METALIZING STEEL WITH SEALER	LUMP SUM
689003-*	METALIZING STEEL WITH SEALER AND TOP COATS	LUMP SUM

DIVISION 700

MATERIALS DETAILS

SECTION 701

HYDRAULIC CEMENT

The Contractor shall provide suitable means for storing and protecting the cement against dampness. Cement which for any reason has become partially set or which contains lumps of caked cement will be rejected. Cement salvaged from discarded or used bags shall not be used.

701.1-PORTLAND CEMENT:

Portland cement shall conform to the requirements of ASTM C 150, Type I.

701.2-BLANK:

701.3-BLENDED HYDRAULIC CEMENTS:

Blended hydraulic cement shall conform to the requirements of ASTM C 595 for Portland Blast-Furnace Slag Cement, Type IS, or Portland-Pozzolan Cement, Type IP.

701.4-MASONRY CEMENT:

Masonry Cement shall conform to the requirements of ASTM C 91.

SECTION 702

FINE AGGREGATE

702.1-FINE AGGREGATE FOR PORTLAND CEMENT CONCRETE:

702.1.1-General Requirements: Fine aggregate shall consist of natural sand, manufactured sand, or a combination thereof, conforming to the requirements of these Specifications.

702.1.2-Deleterious Substances: The Maximum percentages of deleterious substances shall not exceed the limits below.

702.1.3

MATERIAL	PERCENT BY WEIGHT
Amount finer than No. 200 (75 µm) sieve for manufactured fine aggregate (determined by AASHTO T 11 and T 27). A manufactured fine aggregate is one which has been reduced in particle size by crushing	5
Amount finer than No. 200 (75 µm) sieve for all other sands (determined by AASHTO T 11 and T 27)	3
Coal and other lightweight deleterious material (determined by MP 702.01.20)	2
Friable particles (determined by MP 703.01.20)	1

Larger percentages passing the No. 200 (75 µm) sieve in the fine aggregate fraction will be permitted if the percent passing the No. 200 (75 µm) sieve in the coarse aggregate fraction (703.4) is less than the specified maximum. In no event, however, shall the percent passing the No. 200 (75 µm) sieve in the total concrete aggregate be greater than an amount which would exist if both aggregate fractions contained their specified maximum percentage passing the No. 200 (75 µm) sieve.

702.1.3-Soundness (Determined by MP 703.00.22): When the fine aggregate is subjected to five alternations of the sodium sulphate soundness test, the weighted loss shall not exceed 10 percent by weight.

702.1.4-Organic Impurities (Determined by AASHTO T21): When the fine aggregate is subjected to the organic impurities test, the color shall not be darker than the standard. In the event a color darker than the standard is produced, the acceptability of the material will be determined as specified in 702.1.5.

702.1.5-Mortar Strength (Determined by AASHTO T71): Fine aggregate failing the organic impurities test shall be subjected to the test for mortar making properties. The fine aggregate shall develop a compressive strength at the age of seven days when using Type I or II cement, or at three days when using Type III cement, of not less than 90 percent of the strength developed by a mortar prepared in the same manner with the same cement and graded Ottawa sand having a fineness modulus of 2.4 plus or minus 0.10.

702.1.6-Grading: The fine aggregate used for developing a concrete mix design shall have an \bar{A} of 6.1 plus or minus 0.4.

The \bar{A} value shall be determined by adding the cumulative percentages by

weight of material passing each of U.S. Standard Sieve Nos. 1½ in. (37.5 mm), ¾ in. (19 mm), ⅜ in. (9.5 mm), 4 (4.75 mm), 8 (2.36 mm), 16 (1.18 mm), 30 (600 µm), 50 (300 µm), 100 (150 µm), and 200 (75 µm) and dividing by 100.

The gradation shall be determined in accordance with AASHTO T 27 and T 11.

702.1.7-Uniformity of Grading: The gradation limits given in 702.1.6 represent the extreme limits which shall determine suitability of material from all sources of supply. The gradation of material from any one source, however, shall be reasonably uniform.

702.2-MORTAR SAND:

Sand (natural or manufactured) shall meet the requirements of AASHTO M 45, except delete 4.1 through 4.4 and substitute the following:

Aggregate for use in masonry mortar shall be graded within the following limits:

SIEVE SIZE	PERCENT PASSING
No. 4 (4.75 mm)	100
No. 8 (2.36 mm)	90-100
No. 100 (150 µm)	0-30
No. 200 (75 µm)	0-10

For joints thicker than ½ in. (13 mm), sand meeting the requirements of 702.1.1 through 702.1.5 and 702.6 will be permitted.

702.3-FINE AGGREGATE FOR ASPHALT MIXTURES:

Fine aggregate for asphalt mixtures shall meet the requirements of ASTM D 1073, except that the gradation requirements will be waived.

702.4-MINERAL FILLER FOR ASPHALT MIXTURES:

Mineral filler for asphalt mixtures shall meet the requirements of ASTM D 242, modified as follows: Mineral filler shall be free from harmful organic impurities. Gradation requirements will be waived.

702.5-LIGHTWEIGHT FINE AGGREGATE FOR STRUCTURAL CONCRETE:

Lightweight fine aggregate for structural concrete shall meet the requirements of ASTM C 330.

702.6-ALTERNATE GRADING:

Fine aggregate shall be well graded from coarse to fine and shall conform to the following requirements:

SIEVE SIZE	PERCENT PASSING BY WEIGHT
$\frac{3}{8}$ in. (9.5 mm)	100
No. 4 (4.75 mm)	95-100
No. 16 (1.18 mm)	45-80
No. 50 (300 μ m)	10-30
No. 100 (150 μ m)	2-10

SECTION 703

COARSE AGGREGATE

Coarse aggregate shall consist of crushed stone, washed gravel (crushed or uncrushed), crushed slag, or any combination thereof, conforming to the requirements of these Specifications.

703.1-CRUSHED STONE:

703.1.1-General Requirements: Crushed stone shall consist of particles of clean, hard, tough, durable rock free from adherent coatings.

703.1.2-Deleterious Substances: Deleterious substances shall not exceed the limits set forth below:

MATERIAL	PERCENT BY WEIGHT
Thin or elongated pieces (determined by MP 703.00.25)	5
Shale (determined by MP 703.00.27)	1
Coal and other lightweight deleterious material (determined by MP 702.01.20)	1.5
Friable particles (determined by MP 703.01.20)	0.25

703.1.3-Percentage of Wear (AASHTO T 96 or ASTM C 535):

Crushed stone shall have a percentage of wear not to exceed 40.

703.1.4-Soundness (Determined by MP 703.00.22): When subjected to five cycles of the sodium sulphate test, the weighted percentage of loss shall be

not more than twelve.

703.2-GRAVEL:

703.2.1-General Requirements: Gravel shall be composed of particles of hard, durable rock, thoroughly clean and well graded in size. Gravel shall meet the requirements of 703.1.2, 703.1.3 and 703.1.4.

703.2.2-Crushed Particles: The following minimum requirements for percent of crushed particles (determined by MP 703.00.21) for the type of construction indicated shall govern:

	Crushed Particles Minimum Percent by Weight of the Gravel or Blends Retained on No. 4 (4.75 mm) Sieve	
	FRACTURE	
TYPE OF CONSTRUCTION	ONE FACE	TWO FACE
Bituminous Concrete Base 1	80	0
Bituminous Concrete Wearing, Patching and Leveling. Base 2, Prime, Tack, Surface Treatments, Winter Grade Patching Mixtures and aggregates No. 7 and smaller in penetration macadam and Road Mix Bituminous Pavements	-----	80
Bituminous Concrete Surfaces or Wearing Courses on all projects requiring specific skid resistant qualities	-----	80

703.2.3-Pea Gravel: Pea gravel shall consist of clean uncrushed river gravel conforming to the requirements of 703.1.3, 703.1.4, total deleterious substances shall not be greater than five percent, and shall meet the following grading requirements for percent passing:

<u>½ in. (12.5 mm)</u>	<u>No. 16 (1.18 mm)</u>
100	0-5

703.3-SLAG:

Slag shall be air cooled blast-furnace slag, reasonably uniform in density and quality, and free from dirt and other objectionable matter. When tested in accordance with AASHTO T 19 and when standard sizes are combined in the

703.3.1

proportions used in the job mix formula, the slag shall not weigh less than 70 lb. per cu. ft. (1 Mg per cubic meter) when used in portland cement concrete or hot-laid bituminous concrete surface courses, and not less than 60 lb. per cu. ft. (960 kg per cubic meter) when used in other applications. Blast furnace slag shall meet the requirements of 703.1.2 and 703.1.4. In addition to air cooled blast furnace slag, other slags which meet the applicable physical requirements may be used with the approval of the Engineer. All other slag shall meet the requirements of 703.1.2, 703.1.3 and 703.1.4.

703.3.1-Steel Slag: Steel slag, from the production of steel as differentiated from air cooled blast-furnace slag obtained in the production of iron, includes open hearth, electric furnace, and basic oxygen furnace slag.

For items where steel slag is to be used, it must be crushed to its intended item gradation, maintained in a wet condition for a period of at least 12 months, and must be rendered sufficiently insoluble to prevent the discharge of harmful effluent. The aging period shall begin at the completion of stockpiling and shall be monitored by the supplier throughout the aging period. Sampling for moisture tests will be on a stratified random basis vertically with at least three samples from each top one third, the middle one third and the bottom one third of the stockpile. The plan view location of the samples shall also be on a stratified random basis with one sample from each one third of the stockpile.

Test results of the monitoring shall be available to the Division upon request throughout the period.

At approximately three month intervals during the aging period, the supplier shall perform expansion tests in accordance with MP 703.00.28 or other test method agreeable to the Division. The selection of samples for expansion testing shall be the same as that indicated for moisture monitoring.

In addition to the requirements specified elsewhere in the Contract Documents, for the particular item, acceptance of the material will be on the basis of the Division's evaluation of the supplier's written certification that the moisture and expansion monitoring have been accomplished and that the level or degree of expansion exhibited will not be detrimental to the specified item. The certification shall include all test data.

Steel slag shall not be used in any item where horizontal expansion might be detrimental. Such items include, but are not necessarily limited to, the following: aggregate for portland cement concrete or bituminous concrete; backfill around drainage structures, piers, abutments, walls, etc.

703.3.2-Electrometallurgical Slag: Electrometallurgical slag is from the production of metal alloys as differentiated from the production of steel. Electrometallurgical slag may not be used as a portland cement concrete aggregate.

When electrometallurgical slag is used as an aggregate in bituminous construction and payment is on a tonnage (megagram) basis, proper allowance will be made for the difference in weight per cubic foot (meter).

703.3.3-Power Plant Slag: Power plant slag consists of Wet Bottom Boiler Slag (shiny, black, glassy material) formed when molten ash from the burning of coal drops into water and shatters at the bottom of the boiler, and Bottom Ash formed when ash particles from the burning of pulverized coal is allowed to air cool at the bottom of the furnace. Power plant slag may not be used as a portland cement concrete aggregate.

703.4-GRADING OF COARSE AGGREGATES:

Coarse aggregate shall be uniformly graded to conform to the requirements of Table 703.4. The gradation of coarse aggregates in the production of concrete shall be controlled by the \bar{A} value as specified in 501.3 and 601.3. In addition, coarse aggregates to be used in portland cement concrete shall have no more than one percent by weight passing the No. 200 (75 μm) sieve, except that this percentage may be increased to 1.5 in the case of crushed aggregate if the material finer than the No. 200 (75 μm) sieve consists of the dust of fracture, essentially free from clay or shale. The gradation shall be determined in accordance with AASHTO T 27 and T 11.

When the coarse aggregate is to be used in portland cement concrete, larger percentages passing the No. 200 (75 μm) sieve in the coarse aggregate fraction will be permitted if the percent passing the No. 200 (75 μm) sieve in the fine aggregate fraction (702.1) is less than the specified maximum. In no event, however, shall the percent passing the No. 200 (75 μm) sieve in the total concrete aggregate be greater than an amount which would exist if both aggregate fractions contained their specified maximum percentage passing the No. 200 (75 μm) sieve.

Table 703.4 shows the gradations for coarse aggregates required by AASHTO M 43 (Note that the specification current at the time of advertisement of bid shall govern).

703.5-LIGHTWEIGHT COARSE AGGREGATE FOR STRUCTURAL CONCRETE:

Lightweight coarse aggregate for structural concrete shall meet the requirements of ASTM C 330.

TABLE 703.4-STANDARD SIZES OF COARSE AGGREGATES (AASHTO M 43)												
		Amounts finer than each laboratory sieve (square openings), percentage by weight										
Size #	Nominal size square openings ①	4 (100)	3-½ (90)	3 (75)	2-½ (63)	2 (50)	1-½ (37.5)	1 (25)	¾ (19)	½ (12.5)	⅜ (9.5)	No.4 (4.75)

SECTION 704

STONE AND CRUSHED AGGREGATE

704.1-STONE FOR MASONRY:

Stone for coursed masonry shall be tough, sound and durable, resistant to weathering action, reasonably fine grained, uniform in color, and free from seams, cracks, pyrite inclusions or other structural defects. The stone shall have a compressive strength of not less than 5,000 psi (34.5 MPa). Stone shall be of such character that it can be truly wrought to such lines and surfaces as may be required.

704.2-STONE FOR RIPRAP:

Stone of riprap shall consist of field stone or roughunhewn quarry stone as nearly rectangular in section as is practicable. The material shall have a maximum weighted loss of 30 percent when subjected to five cycles of sodium sulfate soundness test, MP 703.00.22.

704.3-STONE FOR GABIONS:

Material for gabions shall consist of rock, field stone, unhewn quarry stone or river bed stone. The dimensions of the rock or stone fillings shall be such as to prevent loss of material through mesh openings and accomplish a mass with a minimum amount of voids. The material shall have a maximum weighted loss of 30 percent when subjected to five cycles of sodium sulfate soundness test, MP 703.00.22.

704.4-DUMPED ROCK GUTTER:

The material for dumped rock gutter shall be rock containing a combined total of not more than 15 percent other suitable material, as determined by visual inspection.

Visual inspection shall be used to determine that the rock will conform to the following weight requirements:

Thickness of Gutter Feet (mm)	70 Percent of the Weight of Material Shall Consist of Stones Weighin Between the Following Limits:
1 (300 mm)	50-100 lb. (20-45 kg)
1.5 (450 mm)	60-150 lb. (25-70 kg)
2.0 (600 mm)	75-200 lb. (30-90 kg)
2.5 (750 mm)	100-250 (45-115 kg)

704.5-SPECIAL ROCK FILL:

Special rock fill shall be limestone or sandstone having a maximum weighted loss of 30 percent when subjected to five cycles of sodium sulfate soundness test, MP 703.00.22. Metallurgical slag or broken concrete, from a source approved by the Engineer, may be furnished.

The rock shall have the dimensions in accordance with the Contract Documents. This slab-like pieces shall not be used.

704.6-AGGREGATE FOR BASE OR SUBBASE COURSE:

704.6.1-General: The material shall consist of gravel, crushed gravel, crushed stone, crushed slag, or any combination of these materials uniformly blended to conform to the requirements of 704.6.2, with the following exception: Los Angeles abrasion is not required for blast furnace slag. Natural or manufactured sand may be used as a component of the blend. Crushed slag shall meet the requirements of 703.3 with the exception of the third and fifth sentences. When gravel is to be used in stabilized (treated) base or subbase construction, it need not be crushed. When used in an unstabilized base or subbase construction, the gravel shall be crushed as specified.

When the Contractor elects to blend materials, each component of the blend shall meet the quality requirements of 704.6.2. Blade or road mixing will not be allowed.

When shoulders are specified, natural sand may not be used as a shoulder component.

704.6.2-Gradation, Quality, and Crushed Particle Requirements:

Material shall be sampled in accordance with MP 700.00.06, Aggregate Sampling Procedures.

When gravel is used in an unstabilized condition and in combination with other types of aggregate, it shall produce a combined material having a minimum of 80 percent one-face fracture as determined by weight of particles retained on the No. 4 (4.75 mm) sieve. When gravel is used in an unstabilized condition and alone, it shall have a minimum of 80 percent one-face fracture as determined by weight of particles retained on the No. 4 (4.75 mm) sieve.

704.6.3-Sampling, Testing and Acceptance Procedure: Material shall be sampled in accordance with MP 700.00.06 Aggregate Sampling procedures. Frequency of sampling and testing and plotting of gradation test data will be in accordance with established Division procedures.

Material failing to comply with the Specification requirements when sampled, tested, and evaluated in accordance with the above Division procedures shall be removed and replaced at the Contractor's expense, or, at the option of the Engineer, may be left in place with reduced payment.

TABLE 704.6.2A – GRADATION REQUIREMENTS

Gradation Amounts Finer Than Each Laboratory Sieve (Square Openings), % By Weight									
Aggr. class	8" (200)	2½" (63)	2" (50)	1½" (37.5)	¾" (19)	#4 (4.75)	#40 (42.5 µm)	#100 (150 µm)	#200 (75 µm)
1				100	50-90	20-50	5-20		0-7
2				100	80-100	35-75	10-30		0-10
4				100	50-95	20-60	5-35		
5			100			30-90			0-25
6				100	50-100	25-70	10-45	3-28	
7	90-100		0-5	with intermediate sizes between 6" (150 mm) and 4" (100 mm) represented					30
8				100	80-100	35-75	10-40		4-14
9		100		80-95	50-70	20-40		0-8	

TABLE 704.6.2B - QUALITY REQUIREMENTS

Aggr. class	Los Angeles Abrasion, Percent, Max.	Sodium Sulphate Soundness, Percent Max.	Liquid Limit Max.	Plasticity Index, Max.	Deleterious Material Percent Max.
1	50	12	25	6	5
2	50-	12	25	6	5
4	Note 1		25	6	5
5			25	6	5
6		30	25	6	5
7					10 (by visual observation)
8	50	12	25	6	5
9	50	12	25	6	5

Note 1: The Los Angeles Abrasion value of aggregate comprising the base course shall be treated in the manner hereinafter set forth to determine the specification requirement for the item:

Los Angeles Abrasion Value Assigned	}	LA ≤ 50 50 < LA ≤ 65 65 < LA ≤ 80 80 < LA	Stabilization Requirements	}	None Top 4 inches (100 mm) Top 6 inches (150 mm) Top 8 inches (200 mm)
Aggregate					

704.6.4

Stabilization shall be accomplished with bituminous material or portland cement in accordance with the applicable sections of these Specifications. When the depth indicated above exceeds the Plan depth for the item, the depth to be stabilized shall be the Plan depth. In the event the Contractor elects to stabilize the material, no separate payment will be made for the cost of such stabilization.

If aggregates are blended to produce the base course material, the Los Angeles Abrasion Value used to determine the stabilization requirements shall be the highest value obtained from testing the individual components of the blend.

704.6.4-Test Methods:

Los Angeles Abrasion	AASHTO T 96, ASTM 535
Soundness (Sodium Sulphate, 5 cycles)	MP 703.00.22
Liquid Limit	AASHTO T 89
Plasticity Index	AASHTO T 90
Deleterious Materials	ASTM C 295, MP 703.01.20, MP 702.01.20, MP 703.00.27
Gradation	AASHTO T 11 and T 27

704.7-FILTER MATERIAL:

Filter material shall consist of sand, other approved inert material, or a combination thereof, having hard, strong, durable particles. The material shall contain not more than a total of five percent coal, clay lumps, shale, soft fragments, organic matter, and other local deleterious substances.

The material shall conform to the following gradation:

U.S. Standard Sieve Size	Percent Passing, by Weight
2 in. (50 mm)	100
No. 4 (4.75 μ m)	65-100
No. 40 (4.25 μ m)	25-50
No. 200 (75 μ m)	0-25

704.8-SHOT ROCK:

Shot rock shall be limestone, sandstone, or other inorganic material acceptable to the Division, having dimensions similar to that which exists after final blasting at the quarry site and prior to crushing. It shall contain material

that would generally be retained on a 6 inch (150 mm) sieve, and not larger than that which could be tailgated from a single axle 8 to 10 ton (7 to 9 Mg) dump truck. In addition, some 10 inch to 12 inch (250 to 300 mm) material shall be represented as an intermediate size. Shot rock shall have a maximum weighted loss of 30 percent when subjected to five cycles of the Sodium Sulfate Soundness test, MP 703.00.22.

Acceptance for gradation shall be on the basis of a letter of certification from the Producer verifying that the sizes specified are represented.

SECTION 705 ASPHALT MATERIALS

Asphalts shall be made by refining of petroleum and shall be free from tar or tar products. The respective types and grades shall meet the specification requirements.

Asphalts shall be sampled in accordance with AASHTO T40. When asphalt material is furnished by a supplier who is not certified under provisions of MP 401.02.25, the supplier shall be required to have each batch or lot of material, to be furnished to the Division, sampled by a Division-approved inspection agency, in accordance with MP 700.00.01 and shall have the samples tested for compliance with the governing Specification in a Division-approved laboratory.

Measurement of the volume of asphalt materials shall be based on the volume of the materials at 60° F (15.5° C). Volumes measured at higher or lower temperatures shall be corrected to the volumes of the material at 60° F (15.5° C) using the coefficients of expansion given below.

TEMPERATURE CONVERSION FACTORS	
Material	Coefficient
Asphalt Emulsion	0.00025 (0.00045)
Asphalt Cement	0.00035 (0.00062)
Cut-back Emulsified Asphalt	0.0004 (0.0007)

Application Temperatures: Unless otherwise indicated or directed, the ranges will be used as guide for application temperatures for the various asphalt materials. Field conditions may require temperatures outside these ranges.

TABLE 705-APPLICATION TEMPERATURES		
Type and Grade of Material	Application Temperature Range Degrees Fahrenheit (Celsius)	
Asphalt's	Spray	Mix
MC-250	100-225 (36-117)	100-225 (36-117)

CMS-2 and CMS-2h	70-160 (22-71)	70-160 (22-71)
CSS-1 and CSS-1h	70-160 (22-71)	70-160 (22-71)
Asphalt Primer for Dampproofing and Waterproofing	50-80 (10-27)	-----
Asphalt for Dampproofing and Waterproofing	300-350 (149-177)	-----
Asphalt Cement		
AC-5	285-350 (141-177)	250-325 (121-163)
AC-10	285-350 (141-177)	250-325 (121-163)
AC-20	285-350 (141-177)	250-325 (121-163)

705.1-WINTER GRADE CUT-BACK ASPHALT: This material shall conform to the requirements specified for MC-250 in AASHTO M 82 and in addition shall meet the requirements of AASHTO T 182.

TABLE 705.1 – ASPHALT EMULSION

Specification Designation	CBAE Primer	AEM-1
Furol Viscosity at 77°F (25° C)	30 - 100	40 - 250
Coating Test	Note 1	Note 2
Water Content (percent)	3 - 8	3 - 8
Residue by Distillation (percent)	45 +	50 +
Residue Penetration 77°F (25° C) 100 g 5 sec	50 - 200	
Residue Solubility in Trichloroethylene (percent)	97.5 +	98 +
Residue Ash Content (percent)	3.0	

Note 1: Wet Stone Coating Test. Fifty grams of a standard reference gravel washed in distilled water, having a minimum pH of 6.3, air-dried for a minimum of 24 hour, and graded to a size that 100 % passes a 3/8 in. (9.5 mm) sieve and is retained on a No. 4 (4.75 mm) sieve, shall be weighed into an eight-ounce seamless tin box and covered with distilled water for five minutes, after which the excess water shall be drained off, and four grams of primer shall be placed on the wet gravel immediately. The mass shall be stirred vigorously for not over five minutes, using a heavy glass rod or metal paddle. At the end of the period the aggregate shall be completely coated with asphalt. Samples of Ohio River gravel aggregate for testing purposes may be secured from the Contract Administration Division's Materials Section, Charleston, West Virginia.

Note 2: The wet aggregate coating test of AASHTO T182 shall be met. Minimum area of aggregate coated shall be 95%.

705.2 – LIQUID ASPHALT (RAPID CURING TYPE):

Rapid curing liquid asphalt shall conform to the requirements of AASHTO M 81.

705.3 – LIQUID ASPHALT (MEDIUM CURING TYPE):

Medium curing liquid asphalt shall conform to the requirements of AASHTO M 82.

705.4 – ASPHALT EMULSION:

Asphalt emulsion in the RS, HFRS, MS, HFMS, and SS grades shall conform to the requirements of AASHTO M 140. Additional cut-back asphalt emulsion grades shall conform to the requirements of Table 705.1. The cut-back asphalt emulsions in Table 705.1 shall be tested in accordance with the applicable methods of testing Liquid Asphalt (Rapid Curing Type), AASHTO M 81.

705.5 – PERFORMANCE GRADED BINDERS:

Performance graded binders shall conform to the requirements of AASHTO MP-1. Unless specified differently in the contract plans, the

705.6

following performance graded binders will be used in the counties as listed (county where the project is located):

PG 64-22: Berkeley, Boone, Braxton, Brooke, Cabell, Calhoun, Clay, Doddridge, Fayette, Gilmer, Hampshire, Hancock, Harrison, Jackson, Jefferson, Kanawha, Lewis, Lincoln, Logan, McDowell, Marion, Marshall, Mason, Mercer, Mineral, Mingo, Monongalia, Monroe, Morgan, Nicholas, Ohio, Pleasants, Putnam, Raleigh, Ritchie, Roane, Summers, Taylor, Tyler, Wayne, Wetzel, Wirt, Wood, Wyoming.

PG 58-28: Pendleton, Pocahontas, Randolph, Tucker.

For the counties of Barbour, Grant, Greenbrier, Hardy, Preston, Upshur, and Webster, either PG 64-22 or PG 58-28 may be used at the contractor's option.

705.6-BLANK

705.7-ASPHALT FOR DAMPPROOFING AND WATERPROOFING:

Materials shall conform to the requirements of AASHTO M 115. Type B.

705.8-PRIMER FOR USE WITH ASPHALT IN DAMPPROOFING AND WATERPROOFING:

This primer shall conform to the requirements of AASHTO M 116.

705.9 THROUGH 705.10-BLANK

705.11-CATIONIC EMULSIFIED ASPHALT:

Cationic emulsified asphalt shall conform to the requirements of AASHTO M 208.

706-BLANK

SECTION 707 CONCRETE ADMIXTURES, CURING AND COATING MATERIALS

707.1-AIR-ENTRAINING ADMIXTURES FOR CONCRETE:

707.1.1-Acceptance Requirements for Air-Entraining Admixtures:

707.1.1.1-In the event that the Contractor elects to use an air-entraining admixture, evidence based on tests made in a recognized laboratory shall be submitted to show that the material conforms to the requirements of AASHTO

707.1.2.3

M 154 for 7-day and 28-day compressive and flexural strengths and resistance to freezing and thawing, except as provided in 707.1.1.2. Tests for bleeding, bond strength and volume change will not be required unless specifically called for in the Plans. A "recognized" laboratory is any Division, Federal Highway Administration or cement and concrete laboratory regularly inspected by the Cement and Concrete Reference Laboratory of the National Bureau of Standards. Tests may be made upon samples taken from a quantity submitted by the Contractor for use on the project or upon samples submitted and certified by the manufacturer as representative of the admixture to be supplied.

707.1.1.2-An exception to the requirements in the preceding paragraph is the case of air-entraining admixtures which are manufactured by neutralizing Vinsol resin with caustic soda (sodium hydroxide). When the Contractor proposes to use such an admixture, the Contractor shall submit a certificate concerning the admixture is the following form:

"This is to certify that the product (trade name) as manufactured and sold by the (company) is an aqueous solution of Vinsol resin that has been neutralized with sodium hydroxide. The ratio of sodium hydroxide to Vinsol resin is one part of sodium hydroxide to (number) parts of Vinsol resin. The percentage of solids based on the residue dried at 221° F (105° C) is (number). No other additive or chemical agent is present in this solution."

707.1.1.3-When the Contractor proposes to use a air-entraining admixture which has been previously approved, the Contractor shall submit a certification stating that the admixture is the same as that previously approved. If an admixture offered for use is essentially the same (with only minor differences in concentration) as another previously approved material, a certification will be required stating that the product is essentially the same as the approved admixture and that no other admixture or chemical agent is present.

707.1.2-Optional Acceptance Requirements for Air-Entraining Admixtures:

707.1.2.1-The Division may elect to approve air-entraining admixtures as satisfactorily meeting acceptance requirements as outlined. If the Division chooses to exercise this option, then the acceptance requirements specified in 707.1.1 above shall be modified as noted.

707.1.2.2-The Division may develop a spectroscopic standard for an air-entraining admixture if such air-entraining admixture has previously been approved by the Division as satisfactorily meeting all the specification requirements as set forth in 707.1.1.

707.1.2.3-When a Contractor proposes to use an air-entraining admixture for which a spectroscopic standard has been developed, then the air-entraining admixture may be approved without further certification being made if a

707.1.3

special analysis made on a representative sample of the admixture proposed for use on the project compares satisfactorily with the standard related thereto.

707.1.3-Additional Test Requirements for Air-Entraining Admixtures (Optional):

707.1.3.1-Either prior to or at any time during construction, the Engineer may require that the admixture selected by the Contractor be further tested to determine its effect upon the strength of the concrete. When so tested, the seven-day compressive strength of concrete made with the cement and aggregates in the proportions to be used in the work and containing the admixture under test is an amount sufficient to produce from four to seven percent entrained air in the plastic concrete shall be not less than 88 percent of the strength of concrete made with the same materials and with the same cement content and consistency but without the admixture.

707.1.3.2-The percentage reduction in strength shall be calculated from the average strength of at least five standard 6 by 12-in. (150 by 300 mm) cylinders of each type of concrete. Specimens shall be made and cured in the laboratory in accordance with the requirements of ASTM C 192 and shall be tested in accordance with the requirements of ASTM C 39. The percentage of entrained air shall be determined in accordance with the requirements of ASTM C 231.

707.1.3.3-Admixtures failing to meet the above requirements will be rejected.

707.2-WATER-REDUCING AND RETARDING ADMIXTURES FOR CONCRETE:

707.2.1-Acceptance Requirements for Approval of Retarders: Water reducing and retarding admixtures for concrete shall conform to the requirements of AASHTO M 194, Type D or Type G.

707.2.2-Performance Requirements for Concrete Retarders:

707.2.2.1-The retarding effect caused by water-reducing and retarding admixtures may vary widely with different types of cement, cement from different mills, aggregates from different sources and of different gradation, and changes in water-cement ratio. Therefore, no retarder shall be used until the concrete of the specified class, designed in accordance with the Specifications and made with the ingredients proposed for use by the Contractor, including Type D or Type G admixtures as specified or permitted under this specification, is shown to meet the requirements of AASHTO M 194 for water reduction and compressive strength increases at ages 3, 7 and 28 days.

707.2.2.2-The mix shall contain the quantity of admixture recommended by the manufacturer at the prevailing temperature.

707.2.3-Optional Performance Requirements for Concrete Retarders:

707.2.3.1-The Division may elect to approve water-reducing and retarding admixtures as satisfactorily meeting performance requirements as outlined. If the Division chooses to exercise this option, then the performance tests specified in 707.2.2 will be waived.

707.2.3.2-The Division's testing laboratory may design concrete mixes in which various types and gradings of aggregates and various types of cements are used and in which water-reducing and retarding admixtures are used, the admixtures first having met the acceptance requirements for approval of concrete retarders as specified in 707.2.1. The water-reducing and retarding admixtures used in laboratory design mixes may be subjected to a spectral analysis, and a spectroscopic standard or a standard spectrograph may be developed if the admixture in combination with the particular type and grading of aggregate and the particular type of cement has met the performance requirements for water-reducing admixtures as specified in 707.2.2.

707.2.3.3-When a Contractor proposes to use a water-reducing and retarding admixture with a type of grading of aggregate and a type of cement which was previously used in a laboratory design mix and for which a special standard is available, the retarder may be approved on the basis of a spectral analysis made on a representative sample of the admixture proposed for use on the project if:

- i. The spectral analysis compares satisfactorily with the standard related thereto, and
- ii. The admixture met performance requirements in previous tests conducted in the Division's laboratory as outlined in 707.2.3.2.

707.2.4-Certification of Water-Reducing and Retarding Admixtures:

When a Contractor proposes to use an approved water-reducing and retarding admixture, the Contractor shall submit a certificate stating that the admixture is identical in composition with the sample that was used for the acceptance tests. If the admixture varies in concentration from the acceptance sample, a certificate will be required stating that the product is essentially the same for chemical ingredients as the approved admixture, and that no other admixture or chemical has been added.

707.2.5-Additional Test Requirements for Water-Reducing and Retarding Admixtures (Optional): Either prior to or at any time during construction, the Engineer may require the selected admixture to be tested further to determine its effect on the strength of the concrete. When so tested

707.3

the retarder shall meet the requirements specified in 707.2.2.

707.3-WATER-REDUCING ADMIXTURES FOR CONCRETE:

707.3.1-Acceptance Requirements for Approval of Water-Reducers:

Water-reducing admixtures for concrete shall conform to the requirements of AASHTO M 194, Type A or Type F.

707.3.2-Performance Requirements for Concrete Water-Reducers:

707.3.2.1-The effects of using water-reducing admixtures may vary widely with different types of cement, cement from different mills, aggregate proportions, aggregates from different sources and of different gradation, and changes in water-cement ratio. Therefore, no water-reducer shall be used until the concrete of the specified class, designed in accordance with these Specifications and made with the ingredients proposed for use by the Contractor, including Type A or Type F admixtures as specified or permitted under this Specification, is shown to meet the requirements of AASHTO M 194 for water reduction and compressive strength increases at ages 3, 7 and 28 days.

707.3.2.2-The mix shall contain the quantity of admixture recommended by the manufacturer at the prevailing temperature.

707.3.3-Optional Performance Requirements for Concrete Water-Reducers:

707.3.3.1-The Division may elect to approve water-reducing admixtures as satisfactorily meeting performance requirements as outlined. If the Division chooses to exercise this option, then the performance tests specified in 707.3.2 will be waived.

707.3.3.2-The Division's testing laboratory may design concrete mixes in which various types and gradings of aggregates and various types of cement are used and in which water-reducing admixtures are used, the admixture first having met the acceptance requirements for approval of concrete water-reducers as specified in 707.3.1. The water-reducing admixture used in laboratory design mixes may be subjected to a special analysis, and a spectroscopic standard or a standard spectrograph may be developed if the admixture in combination with the particular type and grading of aggregate and the particular type of cement has met the performance requirements for water-reducing admixtures as specified in 707.3.2.

707.3.3.3-When a Contractor proposes to use a water-reducing admixture with a type and grading of aggregate and a type of cement which was previously used in a laboratory design mix and for which a spectral standard is available, the water-reducer may be approved on the basis of a spectral analysis

made on a representative sample of the admixture proposed for use on the project if:

- i. The spectral analysis compares satisfactorily with the standard related thereto, and
- ii. The admixture met performance requirements in previous tests conducted in the Division's laboratory as outlined in 707.3.3.2.

707.3.4-Certification of Water-Reducing Admixtures: When a Contractor proposes to use an approved water-reducing admixture, the procedure set forth in 707.2.4 shall apply.

707.3.5-Additional Test Requirements for Water-Reducing Admixtures (Optional): Either prior to or at any time during construction, the Engineer may require the selected admixture to be tested further to determine its effect on the strength of the concrete. When so tested the water-reducer shall meet the requirements specified in 707.3.2.

707.4-POZZOLANIC ADDITIVES FOR USE IN PORTLAND CEMENT CONCRETE:

707.4.1-Fly ash shall conform to the following requirements when sampled and tested in accordance with the applicable Section of ASTM C311

FINENESS	Class F (ASTM C618)	Class C (ASTM C618)
Amount Retained on No. 325 (45 µm) Sieve	34% Max.	34% Max.
Loss on Ignition:	6% Max.	6% Max.
$\text{SiO}_2 + \text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3$	70% Min.	50% Min

707.4.2-Ground granulated blast furnace slag shall conform to the requirements of AASHTO M302, Tables I and II except that slag activity index requirements of Table II do not apply.

707.4.3-Microsilica shall conform to requirements of AASHTO M 307 except Table 2 shall not apply.

707.5-BLANK

707.6-POLYETHYLENE COATED BURLAP FOR CURING

707.7

CONCRETE:

This material shall consist of burlap impregnated on one side with white opaque plastic film. The plastic film shall be securely bonded to the burlap. The film shall be clean and free of imperfections. Acceptance will be based on visual inspection.

707.7-BURLAP CLOTH MADE FROM JUTE OR KENAF FOR CURING CONCRETE:

The burlap cover shall be clean and free of defects. The cover shall provide a water retention blanket over the concrete. Acceptance will be based on visual inspection.

707.8-WATERPROOF PAPER FOR CURING CONCRETE:

Waterproof paper shall consist of two sheets of kraft paper cemented together with bituminous material and reinforced with fiber. The top surface shall be white. Acceptance will be based on visual inspection.

707.9-LIQUID MEMBRANE-FORMING COMPOUNDS FOR CURING CONCRETE:

Curing compounds shall conform to the requirements of AASHTO M148, Type 2, Class A.

707.10-WHITE POLYETHYLENE SHEETING (FILM) FOR CURING CONCRETE:

The sheeting shall be opaque white plastic film. The film shall be clean and free of imperfections. Acceptance will be based on visual inspection.

707.11-EPOXY RESIN PROTECTIVE COATING:

The material shall conform to the requirements of ASTM C881, Type III, Grades 1 or 2, Class B or C. Pigmentation shall be required in the system so the cured coating shall conform to Federal Color Standard 595, No. 16357.

707.12- Concrete Sealer:

707.12.1 – General: The material shall be a one component, water repellant penetrating sealer, meeting the criteria for Series II and Series IV (southern climate testing procedure) tests as referenced in NCHRP 244. The material shall be capable of meeting the criteria with a single coat and shall not alter the color of the treated surfaces.

707.12.2 – Acceptance: When using a sealer not on the Division's approved list, the Contractor shall furnish certified laboratory test data showing the material approved for the use meets the NCHRP 244 criteria at the manufacturers recommended rate of application.

SECTION 708 JOINT MATERIALS

708.1-PREFORMED EXPANSION JOINT FILLER FOR CONCRETE:

708.1.1-Nonextruding and Resilient Nonbituminous Type: The material shall conform to the requirements of AASHTO M 153. The sampling frequency shall be on the basis of one sample per each day of a manufacturer's production for each thickness.

708.1.2-Nonextruding and Resilient Bituminous Type: The material shall conform to the requirements of AASHTO M 213. The sampling frequency shall be on the basis of one sample per each day of a manufacturer's production for each thickness.

708.2-PREFORMED ELASTOMERIC JOINT SEALS;

LUBRICANT-ADHESIVES:

708.2.1 - Joint Seals for Concrete Pavements: This material shall meet the requirements of AASHTO M 220. The lubricant - adhesive shall be of the type recommended by the seal manufacturer.

708.2.2 - Joint Seals for Bridges: Multiple web design and strip seals shall meet the requirements of AASHTO M 297. The compression-deflection and recovery tests for strip seals are deleted. The lubricant-adhesive shall be of the type recommended by the seal manufacturer.

708.3-JOINT SEALANT, HOT-POURED FOR CONCRETE AND ASPHALT PAVEMENTS:

This material shall meet the requirements of ASTM D3405.

708.4-SILICONE JOINT SEALANT; JOINT BACK-UP MATERIAL:

708.4.1-Silicone Joint Sealant:

708.4.1.1-General Requirements: Silicone sealant shall be furnished in a one part formulation. The compound shall be compatible with the surface to which it is applied. Acid cure sealants are not acceptable for use on concrete.

Silicone sealants shall be of the following types:

Type I-A low modulus non-sag silicone for use in sealing horizontal and sloping joints in portland cement concrete pavements. Tooling is required.

Type II-A very low modulus self leveling silicone used to seal horizontal joints in portland cement concrete pavements.

Type III-An ultra low modulus self leveling silicone used to seal horizontal joints in portland cement concrete pavements. It can also be used to seal joints between portland cement concrete pavement and asphalt concrete shoulders.

708.4.1.2-Test Requirements: The sealant shall meet the following requirements.

TEST METHOD	TEST	TYPE I	TYPE II	TYPE III
ASTM D2202	Flow	0.3 In. (7.6 mm) Max	Self-Leveling	Self-Leveling
ASTM C679	Tack Free Time	1.5 Hours Maximum		
Manufacturer Note 1	Skin Over Time		2 Hours Maximum	2 Hours Maximum
ASTM D412 Die C Notes 2 & 3	Modulus @ 150% Elongation	45 PSI (310 kPa) Max	40 PSI (276 kPa) Max	15 PSI (103 kPa) Max
ASTM D412 Die C Notes 2 & 3	Elongation	500% Minimum	500% Minimum	500% Minimum
ASTM D3583 Notes 2, 3, 4, 5	Adhesion To Concrete	No Failures @ 200% Elongation Minimum	No Failures @ 200% Elongation Minimum	No Failures @ 200% Elongation Minimum
ASTM C719 Note 6	Movement Capability 10 Cycles @ $\pm 50\%$	No Adhesive Or Cohesive Failures	No Adhesive Or Cohesive Failures	No Adhesive Or Cohesive Failures
ASTM C793 Notes 2 & 3	Accelerated Weathering 5,000 Hours	No Cracking	No Cracking	No Cracking

NOTE 1: The manufacturer shall verify that the sealant will have a skin over time within the time limitations under field conditions.

NOTE 2: Cure Temperature $77^{\circ} \pm 3^{\circ} \text{ F}$ ($25 \pm 2^{\circ} \text{ C}$) at $50 \pm 5\%$ Relative Humidity.

NOTE 3: Cure Time 21 Days Maximum.

NOTE 4: Specimens shall be 0.5 in. x 0.5 in. x 2.0 in (13 mm x 13 mm x 50 mm).

NOTE 5: Type III material shall also demonstrate adhesion to asphalt blocks.

NOTE 6: Type I material shall have movement capability 10 cycles @ $+100\%$, -50% .

708.4.1.3-Acceptance: Manufacturers of silicone joint sealants shall submit certified test data during the first calendar quarter of each year. The testing

shall be performed by an independent testing laboratory. The test data must demonstrate that all requirements of the specifications are met. Only those sealants which have been evaluated and appear on the Division's approved list can be used on a project. Manufacturers are responsible for quality control of their product and the submission of test data in a timely manner in order to be considered for and/or continue to have their product on the approved list.

708.4.2-Joint Back-Up Material: Joint back-up material shall be compatible with the sealant. The material shall be the correct size to fit tightly in the joint to resist movement and to prevent the sealant from moving past the back-up material to the bottom of the joint.

708.5-VITRIFIED CLAY PIPE JOINTS HAVING RESILIENT PROPERTIES:

This material shall conform to the requirements of ASTM C 425.

708.6-HOT POUR MINERAL FILLED JOINT SEALER FOR SEWER AND CULVERT PIPE:

Hot pour mineral filled sealing compound shall conform to the requirements of Federal Specifications SS-S-169.

708.7-JOINTS FOR CIRCULAR CONCRETE SEWER AND CULVERT PIPE USING FLEXIBLE WATERTIGHT GASKETS:

Joints for circular concrete sewer and culvert pipe shall conform to the requirements of AASHTO M 198.

708.8-JOINT MORTAR:

Joint mortar shall consist of one part cement and two parts sand, with water as necessary to obtain the required consistency. Sand shall conform to the requirements of 702.2. Cement shall conform to the requirements of 701.4 for masonry construction. For other uses cement shall conform to the requirements of 701.1 or 701.3.

Mortar shall be used within 30 minutes after its preparation.

708.9-ASPHALT PLASTIC CEMENT:

708.9.1 - General Requirement: Asphalt plastic cement is intended for use as a joint sealer for concrete and masonry. It shall consist of an asphalt base, volatile petroleum solvents, and mineral stabilizers, mixed to a smooth, uniform consistency, suitable for trowel application.

708.9.2 - Composition:

	Minimum	Maximum
Nonvolatile Matter, %	70	
Mineral Matter (Ash), %	15	45

708.9.3

708.9.3 - Physical Requirements:

Uniformity - A thoroughly stirred sample shall show no separation of solvent or setting that cannot be overcome by moderate stirring after standing for 6 hours at room temperature in a closed container.

Workability - The asphalt plastic cement shall spread readily without drawing or pulling when applied to a metal test panel and spread to a thickness of approximately $\frac{1}{8}$ inch (3 mm).

Behavior at 60° C (140° F) - A sample cured at room temperature for one hour, and heated in a ($60^{\circ} \pm 2^{\circ}$ C) oven for five hours shall show no blistering and not more than $\frac{1}{4}$ inch (6 mm) sagging or slipping.

Behavior at 0° C (32° F) - After completion of the 60° C behavior test, the sample shall be cooled to $0 \pm 2^{\circ}$ C for one hour. Immediately after this exposure, the sample shall be bent around a 1 inch (25 mm) diameter mandrel. The sample shall show no cracking of the asphalt or separation of the asphalt from the panel.

708.9.4 - Test Methods:

Nonvolatile matter - Test in accordance with ASTM D 2822.

Ash - Transfer approximately 5 grams of the sample (weighed to the nearest 0.01g) to a crucible and heat at a low temperature (not above a dull red heat) until all carbon is consumed. Cool in a desiccator, weigh and calculate the percentage of ash.

708.10-WATERSTOPS (ELASTOMER MATERIAL):

All waterstops shall be produced by a molded or extrusion process such that, as supplied for use, they will be dense, homogenous, and free from holes and other imperfections. The cross section of the waterstop shall be uniform along the length and shall be symmetrical transversely so that the thickness at any given distance from either edge of the waterstop will be uniform. One three foot (meter) sample shall be furnished for each 1,000 ft. (300 meters), or fraction thereof, of each size of waterstop material.

The waterstops shall conform to the requirements in Table 708.10.1 for the polyvinylchloride waterstops and Table 708.10.2 for rubber waterstops.

TABLE 708.10.1-POLYVINYLCHLORIDE WATERSTOPS		
PROPERTY	VALUE	TEST METHOD
Tensile Strength, Die "C", psi (Mpa)	1,400 (9.6) min.	ASTM D 412
Ultimate Elongation, Die "C", percent	280 min.	ASTM 412
Cold Bend Test	No Cracking	**

708.10.2

** The cold bend test shall be made by subjecting three full-width, one-inch long sample specimens to a temperature of 20°F for two hours. The specimen shall then be bent 180° around a ½ in. mandrel

TABLE 708.10.2-RUBBER WATERSTOPS		
PROPERTY	VALUE	TEST METHOD
Tensile Strength, Die “C”, psi (Mpa)	2,000 (14) min.	ASTM D 412
Ultimate Elongation, Die “C”, percent	360 min.	ASTM 412
Shore Durometer Hardness, Type A	60-85	ASTM D 2240
Absorption of Water, by Weight, percent	5 max.	ASTM D 570
Weight per linear ft.	0.67 lb. (0.3 kg) min.	-----

SECTION 709

METALS

709.1-STEEL BARS FOR CONCRETE REINFORCEMENT:

All bar reinforcement, whether deformed or plain, shall meet the requirements of AASHTO M 31 or M 42. Bars shall be of a deformed type, unless otherwise specified. All reinforcement for use in structures shall be labeled to correspond with marks on the Plans before being shipped to the job site.

When reinforcing steel material is furnished by a supplier who is not certified under provisions of MP 709.01.50, the supplier shall at their expense be required to have each heat or lot of material to be furnished to the Division, sampled by a Division approved inspection agency in accordance with MP 700.00.01 and shall have the samples tested for compliance with the governing specification by a Division approved laboratory. The test and inspection information shall be furnished in the Division approved computer acceptable format.

Epoxy coated reinforcing steel shall meet the requirements of AASHTO M 284. Except that Section 12.2 of AASHTO M284, shall be deleted and replaced with the following. The Contractor shall repair any damage to epoxy coating of reinforcing steel that occurs during the shipment, storage and installation of the steel. The sum of all damage areas in each one foot (300 mm) length of bar shall not exceed two percent of the bar area. The total bar surface area covered by patching material shall not exceed five percent.

709.1.1: All bar reinforcement, whether deformed or plain, shall meet the requirements of AASHTO M 31 or M 42. Bars shall be of a deformed type, unless otherwise specified. All reinforcement for use in structures shall be labeled to correspond with marks on the Plans before being shipped to the job site. When reinforcing steel material is furnished by a supplier who is not certified under provisions of MP 709.01.50, the supplier shall at their expense be required to have each heat or lot of material to be furnished to the Division, sampled by a Division approved inspection agency in accordance with MP 700.00.01 and shall have the samples tested for compliance with the governing specification by a Division approved laboratory. The inspection and test data shall be provided to the Contract Administration Division for verification of specification compliance.

709.1.2-Epoxy coated reinforcing steel shall meet the requirements of Section 709.1.1 and AASHTO M 284. When epoxy coated reinforcing steel is furnished by a coater who is not certified under the provisions of MP 709.01.51, the supplier shall be required to have the material tested at their own expense. Sampling shall be done by a Division approved inspection agency in accordance with MP 700.00.01. The samples shall be tested for compliance with the governing specification by a Division approved laboratory. The inspection and test data shall be provided to the Contract Administration

Division for verification of specification compliance.

709.2-PRESTRESSING REINFORCEMENT:

Prestressing reinforcement shall be high-tensile steel wire conforming to AASHTO M 204, high-tensile wire strand conforming to AASHTO M 203, or high-tensile-strength steel bars conforming to AASHTO M 275.

709.3-BLANK

709.4-WELDED WIRE FABRIC FOR CONCRETE REINFORCEMENT:

Welded wire fabric for concrete reinforcement shall conform to the requirements of AASHTO M 55, except as modified.

Fabric reinforcement for pavement shall be not less than 5 feet (1.5 meters) in width and shall be shipped in sheets and not in rolls. Fabric for slope protection, gutters and miscellaneous items may be shipped in rolls. Sheets shall be bent in the shop as shown on the Plans. Epoxy coated welded wire fabric for concrete reinforcement shall meet the requirements of ASTM A 884/A 884M.

709.5-EXPANDED METAL PAVEMENT REINFORCEMENT:

Expanded metal pavement reinforcement shall be made from open-hearth mild steel plates by a cutting and drawing process to form a uniform diamond shape mesh. The weight per 100 sq. ft. (10 square) and size of the meshes shall be as specified on the Plans. The strands or members shall be clean cut, straight and uniform in size. A bend test specimen cut from the furnished fabric shall withstand bending cold through 180 degrees flat upon itself without cracking on the outside of the bent portion. A tensile specimen cut from the furnished material shall have a minimum tensile strength of 55,000 psi (380 MPa). The chemical composition of the steel shall conform to SAE Standard No. 1010.

709.6-FABRICATED BAR OR ROD MATS FOR CONCRETE REINFORCEMENT:

Fabricated steel bar or rod mats shall conform to the requirements of AASHTO M 54.

709.7-JOINT TIE BOLT ASSEMBLY:

Joint tie bolt assemblies shall conform to the applicable details of the Standard Detail Book, Volume I. The bar used shall conform to the requirements of ASTM F432, Grade 55. The tensile strength of the assembly shall be not less than 15,000 lb. (65 kN) The coupling or shank of the hook bolt shall provide a positive stop to prevent the shank of the hook bolt from being threaded beyond the center of the coupling. The tie bolt assemblies shall be equipped with an approved fastener for installation of the assembly in the steel pavement form. The fastener shall hold the assembly in the designated position

709.8

during the placing and finishing of the concrete and subsequent removal of the pavement forms without damage to the concrete or the tie bolt assembly.

709.8 - HIGH STRENGTH LOW ALLOY STRUCTURAL METAL:

High-strength structural steel for bridges shall conform to AASHTO M270, grades 50, 50W or 70W. High-strength steel for all other applications shall conform to AASHTO M222 (weathering) or AASHTO M223.

709.9-BLANK

709.10-GRAY IRON, MALLEABLE IRON AND DUCTILE IRON CASTINGS:

Gray iron castings shall conform to the requirements of AASHTO M 105, Class No. 30.

Malleable iron castings shall conform to the requirements of ASTM A 47, Grade 32510. Castings shall be boldly filleted at angles, and thearrises shall be sharp and perfect.

Malleable iron castings for railings posts shall be Grade No. 32510 and shall be galvanized with hot-dipped zinc coating in accordance with AASHTO M 232.

Ductile iron castings shall conform to the requirements of ASTM A-536, Grade 80-55-6, 65-45-12 or 60-40-18.

The dimension tolerance for gray iron castings is $\pm 1/16$ inch per foot (5.2 mm per meter) and the weight tolerance is $\pm 5\%$.

All castings shall contain a manufacturer's heat number, lot number, or cast date. This identification shall be cast into the material at the time of manufacturer.

709.11-BLANK

709.12 - STRUCTURAL AND EYEBAR STEEL:

All structural steel for bridges shall conform to the applicable grade of AASHTO M270 that is specified in the Plans. When no specific grade is called for, AASHTO M270, Grade 36 shall be used. Non-designated structural steel in all other sections of the Specifications shall conform to AASHTO M183.

709.13-STEEL FORGINGS AND STEEL SHAFTING:

709.13.1-Steel Forgings: Steel forgings shall conform to AASHTO M 102, Class E. They shall be bored as specified in [615.4.9.2](#). A record of the annealing or normalizing changes shall be furnished showing the forgings in such charge, the melt or melts from which they were secured and the treatment they received.

709.13.2-Steel Shafting: Cold finished carbon steel shafting shall conform to AASHTO M169 Grades 1016 through 1030, inclusive, unless otherwise specified.

709.14-STEEL CASTINGS:

Steel castings shall conform to the requirements of AASHTO M 103, except steel produced by the converter process shall not be used. All steel castings shall be grade 65-35 (450-240). Sharp unfilleted angles or corners shall not be permitted.

709.15-COATED DOWEL BARS FOR PAVEMENT JOINT REINFORCEMENT:

Coated dowel bars shall meet the requirements of AASHTO M 254 with the following exceptions (numbers refer to subsections of AASHTO M 254):

3. Materials

3.1 The core material shall meet the requirements of 709.1.

4. Dimensions

4.2 The nonabraded thickness of the Type A coating shall be a minimum of 25 mils (635 μ m).

The nonabraded thickness of the Type B coating shall be a minimum of 7 mils (175 μ m).

6. Sampling

ADD THE FOLLOWING

Samples for Section 5.1 thru 5.4 shall be in a basket assembly.

7. Documentation

7.3 ADD THE FOLLOWING.

The coating applicator shall be certified as set forth in MP 709.01.51.

The coated dowel manufacturer shall be certified as set forth in MP 709.15.50.

7.7 ADD THE FOLLOWING:

Regardless of general acceptance of coated dowel bars by the Division when bar coatings are found to be perforated, cracked or otherwise damaged, including extensive coating damage at welds, prior to or during installation in the pavement, such bars will be rejected from use and shall be replaced with acceptable bars by the Contractor at no additional cost to the Division.

709.16-BLANK**709.17-WELDED AND SEAMLESS STEEL PIPE:**

Black and galvanized steel pipe shall meet the requirements of ASTM A 53. When used for other than pressure pipe, the hydrostatic test will be waived. Pipe for ferrous metal railing shall be galvanized after fabrication in accordance with AASHTO M 111.

709.18-COPPER ALLOY CASTINGS FOR BEARING, EXPANSION, AND NAME PLATES FOR BRIDGES:

709.18.1-Copper Alloy Castings for Bearing and Expansion Plates for Bridges: The copper alloy castings for bearing and expansion plates for bridges shall be bronze conforming to the requirements of AASHTO M 107, Copper Alloy UNS Number C91100.

709.18.2-Copper Alloy Castings for Name Plates for Bridges: The copper alloy for name plates shall meet the requirements of ASTM B584, alloy C83600, C83450, C83800, C92200, or C92210. The mechanical requirements of the specification are waived

709.19-ROLLED COPPER-ALLOY BEARING AND EXPANSION PLATES FOR BRIDGES:

The rolled plates shall conform to the requirements of AASHTO M 108, Alloy C51000 or C51100.

709.20-FLASHING FOR CONSTRUCTION AND EXPANSION JOINTS:

709.20.1-Copper: Copper shall conform to the requirements of AASHTO M 138. Any type cold finished, suitable for the purpose intended, may be used. The sheet shall withstand being bent cold through 180°, flat upon itself, without fracture on the outside of the bent portion. Unless otherwise specified, thickness of the sheet shall be 0.022 in. (approximately 16 oz. per sq. ft.) (550 µm (approximately 4.88 kg per square meter)) with a tolerance of ± 0.002 in (50 µm).

709.20.2-Nickel-Copper Alloy: Nickel-copper alloy sheeting for flashing shall conform to the requirements of ASTM B 127. It shall be cold rolled, deep drawing and spinning quality. The thickness shall be as specified on the plans.

709.21-PIPES FOR FLOOR DRAINS AND DOWN-SPOUTS:

Cast iron pipe for floor drains and down-spouts shall conform to the requirements of ASTM A 74.

709.22-BLANK

709.23-STEEL BOLTS AND NUTS:

Material shall meet the requirements of ASTM A 307.

709.24-HIGH-STRENGTH BOLTS FOR STRUCTURAL STEEL JOINTS, INCLUDING SUITABLE NUTS AND HARDENED WASHERS:

709.24.1 - Bolts, Nuts and Washers: All bolts, nuts and washers shall bear the manufacturer's markings and all markings specified in the applicable AASHTO specifications. All bolts, nuts and washers supplied shall be domestic, as defined in 106.1.1.1, and the manufacturer and identification marks shall be registered in the Industrial Fastener Institute's Technical Information Report IFI-122.

709.24.2 - High-Strength Bolts: High-Strength bolts, black, galvanized or zinc rich coated, shall meet the requirements of AASHTO M164 with the following exceptions. Zinc rich coated fasteners shall also meet the requirements of 709.24.10.

709.24.2.1- Blank

709.24.2.2: Proof load tests (ASTM F606, Method #1) are required for all bolts except as excluded in Section 6.2 of AASHTO M 164. Minimum frequency of tests shall be as specified in AASHTO M 164, paragraph 9.5.1.

709.24.2.3: Wedge tests on full size bolts (ASTM F606, paragraph 3.5) are required. If bolts are to be galvanized or zinc rich coated, tests shall be performed after galvanizing or coating. Minimum frequency of tests shall be specified in AASHTO M 164, paragraph 9.5.1.

709.24.2.4: If galvanized or zinc rich coated bolts are supplied, the thickness of the zinc coating shall be measured. Measurements shall be taken on the wrench flats or top of bolt head.

709.24.3 - Nuts: Nuts plain, galvanized or zinc rich coated shall meet the following requirements.

709.24.3.1: Nuts to be galvanized (hot-dip or mechanically galvanized), or to be zinc rich coated shall be grade DH or DH3 meeting AASHTO M 291 or shall be grade 2H meeting AASHTO M 292.

709.24.3.2: Plain (black) nuts shall be grade C, D or C3 meeting AASHTO M 291 or shall be grade 2 meeting AASHTO M 292 and shall have a minimum Rockwell hardness of 89 HRB (or Brinell hardness 180 HB). Plain nuts may also be supplied to grades listed in paragraph 709.24.3.1 above.

709.24.3.3: Nuts that are to be galvanized shall be tapped oversize the minimum amount required for proper assembly. The amount of overlap in the nut shall be such that the nut will assemble freely on the bolt in the coated condition and shall meet the mechanical requirements of the applicable AASHTO specification listed above and shall meet the requirements of the rotational-capacity test specified (the overlapping requirements of AASHTO M 291, paragraph 7.4 shall be considered maximum values instead of

709.24.3

minimum, as currently shown).

709.24.3.4: Galvanized and zinc rich coated nuts shall be coated with a lubricant containing a dye of any color that contrasts with the color of the coating.

709.24.3.5: Proof load tests (ASTM F606, paragraph 4.2) are required for all nuts. Minimum frequency of tests shall be as specified in AASHTO M 291, paragraph 9.3 or AASHTO M 292, paragraph 7.1.2.1. If nuts are to be galvanized or zinc rich coated, tests shall be performed after coating, overtapping and lubricating.

709.24.3.6: If galvanized or zinc rich coated nuts are supplied, the thickness of the coating shall be measured. Measurements shall be taken on the wrench flats.

709.24.4 - Hardened Washers: Hardened washers, plain, galvanized or zinc rich coated shall meet the requirements of AASHTO M 293 and the following:

709.24.4.1: If galvanized or zinc rich coated washers are supplied, hardness testing shall be performed after coating. (Coating shall be removed prior to taking hardness measurements).

709.24.4.2: If galvanized or zinc rich coated washers are supplied, the thickness of the coating shall be measured.

709.24.5 - Rotational Capacity Testing: Rotational-capacity tests are required and shall be performed on all black (plain), galvanized (after galvanizing) bolt, nut and washer assemblies by the manufacturer or distributor prior to shipping. Washers are required as a part of the test. The following shall apply:

709.24.5.1: Except as modified, the rotational-capacity test shall be performed in accordance with the requirements of AASHTO M 164.

709.24.5.2: Each combination of bolt production lot, nut lot and washer lot shall be tested as an assembly.

709.24.5.3: A rotational-capacity lot number shall be assigned to each combination of lots tested.

709.24.5.4: The minimum frequency of testing shall be two assemblies per rotational-capacity lot.

709.24.5.5: The bolt, nut and washer assembly shall be assembled in a

Skidmore-Wilhelm Calibrator or an acceptable equivalent device. For short bolts which are too short to be assembled in the Skidmore-Wilhelm Calibrator see Section 709.24.5.9.

709.24.5.6: The minimum rotation, from an initial condition (10% of the specified bolt proof load), shall be:

240° ($\frac{2}{3}$ turn) for bolt lengths up to and including 4 diameters.

360° (1 turn) for bolt lengths over 4 diameters up to and including 8 diameters.

480° ($1\frac{1}{3}$ turn) for bolt lengths over 8 diameters.

709.24.5.7: The tension reached at the above rotation shall be equal to or greater than 1.15 times the required installation tension. The installation tension and the tension for the turn test are shown below:

{ENGLISH}

Diameter (Inches)	$\frac{5}{8}$	$\frac{3}{4}$	$\frac{7}{8}$	1	$1\frac{1}{8}$	$1\frac{1}{4}$	$1\frac{1}{2}$
Required Installation Tension (kips)	19	28	39	51	56	71	103
Turn Test Tension (kips)	22	32	45	59	64	82	118

{METRIC}

Diameter (mm)	16	20	22	24	27	30	36
Required Installation Tension (kN)	91	142	176	205	276	326	475
Turn Test Tension (kN)	105	163	202	236	317	375	546

709.24.5.8: After the required installation tension listed above has been exceeded, one reading of tension and torque shall be taken and recorded. The torque value shall conform to the following:

709.24.5

$$\text{Torque (T)} \leq 0.25 \text{ PD}$$

Where:

$$\text{Torque (T)} = \text{measured torque (foot-pounds) (kN}\cdot\text{m)}$$

$$P = \text{measured bolt tension (pounds) (kN)}$$

$$D = \text{bolt diameter (feet) (m)}$$

709.24.5.9: Bolts that are too short to test in a Skidmore-Wilhelm Calibrator may be tested in a steel joint. The tension requirement of Section 709.24.5.7 need not apply. The maximum torque requirement of Section 709.24.5.8 shall be computed using a value P equal to the turn test tension shown in the Table in Section 709.24.5.7.

709.24.6 - Reporting of Test Results:

709.24.6.1: The results of all tests (including zinc coating thickness) required and in the appropriate AASHTO specifications shall be recorded on an appropriate document.

709.24.6.2: Location where tests are performed and date of tests shall be reported on the appropriate document.

709.24.7 - Witnessing of Tests: The tests need not be witnessed by an independent inspection agency. However, the manufacturer or distributor that performs the test shall certify that the results recorded are accurate. Independent of the above, the Engineer reserves the right to witness any and all tests as the Engineer deems necessary. The manufacturer or distributor will notify the Engineer prior to conducting any tests.

709.24.8 - Documentation:

709.24.8.1: Mill Test Report(s) (MTR) shall be furnished for all mill steel used in the manufacture of the bolts, nuts and washers. MTR shall indicate the place where the material was melted and manufactured.

709.24.8.2: Manufacturer Certified Test Report(s) (MCTR): The manufacturer of the bolts, nuts and washers shall furnish test reports (MCTR) for the items furnished. Each MCTR shall show the relevant information required in accordance with Section 709.24.6. The manufacturer performing the rotational-capacity test shall include on the MCTR:

- The lot number of each of the items tested.
- The rotational-capacity lot number as required in Section 709.24.5.3.
- The results of the tests required in Section 709.24.5.
- The pertinent information required in Section 709.24.6.2.
- A statement that MCTR for the items are in conformance to this specification and the appropriate AASHTO specification.

- f. The location where the bolt assembly components were manufactured.

709.24.8.3-Distributor Certified Test Report(s) (DCTR): The DCTR shall include MCTR above for the various bolt assembly components. The rotational-capacity test may be performed by a distributor (in lieu of a manufacturer) and reported on the DCTR. The DCTR shall show the results of tests required in Section 709.24.5; shall show the pertinent information required in Section 709.24.6.2 and shall show the rotational-capacity lot number as required in Section 709.24.5.3. The DCTR shall certify that the MCTR are in conformance to this specification and the appropriate AASHTO specifications.

709.24.9 - Shipping:

709.24.9.1: Bolts, nuts and washers from each rotational-capacity lot shall be shipped in the same container. If there is only one production lot number for each size of nut and washer, the nuts and washers may be shipped in separate containers. Each container shall be watertight and shall be permanently marked with a shipping label on the container lid and on the side of the container. The labels shall contain, as a minimum, the following information: quantity and description of contents, manufacturer's lot number for each item and the rotational - capacity lot number.

709.24.9.2: The appropriate MTR, MCTR or DCTR shall be supplied to the Engineer or representative prior to installation of any fasteners.

709.24.10 - Zinc Rich Coated Fasteners:

709.24.10.1: Fastener components shall be vapor degreased, blast cleaned to Steel Structures Painting Council (SSPC) condition SSPC-10 (near white) and spray coated with a high ratio water-based inorganic zinc rich primer meeting the requirements of Section 711.20.2 of the Standard Specifications. The primer utilized shall be included on the Division of Highways Approved List of Zinc Primers. Copies of the Approval List are available from WVDOH District Materials Officers or from the Materials Section in Charleston, WV.

709.24.10.2: Dry film thickness of the zinc rich primer shall be 2 mils (50 μ m) minimum and 4 mils (100 μ m) maximum.

709.25-STEEL SHELLS OR CASINGS (DRIVEN WITHOUT MANDREL) FOR CAST-IN-PLACE PILES:

Steel shells or casings shall be composed of basic open hearth steel having a tensile strength of not less than 50,000 psi (345 MPa). The thickness of metal shall be as indicated on the Plans. The tips (small end) shall be equipped with a steel driving point securely fastened to the shell and the entire shell shall form one integral water-tight unit. Shells shall be tapered or step-tapered from top

709.26

to bottom.

Any shell proposed for use shall be approved by the Engineer before driving.

709.26 THROUGH 709.28-BLANK**709.29-ZINC COATED STEEL SHEETS FOR USE IN
MANUFACTURING TRAFFIC SIGNS:**

The zinc coated steel sheets shall be 16 gage (USS) and shall conform to the requirements of ASTM A 525.

The sheets shall be resquared. They shall be furnished with a galvanized coating, Class 2.00.

The surface of the sheets shall be clean, free of oil, soot, dirt, scale, and other foreign material. They shall be protected in transit and shall be suitable for painting without cleaning or processing in any manner upon receipt by the Division.

709.30-CAST IRON SOIL PIPE AND FITTINGS:

Cast iron soil pipe and fittings shall conform to the requirements of ASTM A 74.

**709.31-ALUMINUM ALLOY EXTRUSIONS AND ALUMINUM
ALLOY EXTRUDED TUBE:**

Aluminum alloy extrusions and extruded tube shall conform to ASTM B 221, alloy 6061, temper condition T6.

709.32-ALUMINUM ALLOY STANDARD STRUCTURAL SHAPES:

Aluminum alloy standard structural shapes, rolled or extruded, shall conform to ASTM B 308, alloy 6061, temper condition T6.

709.33-ALUMINUM ALLOY DRAWN TUBE:

Aluminum alloy drawn tube shall conform to ASTM B 210, alloy 6061, temper condition T6.

709.34-ALUMINUM ALLOY PIPES:

Aluminum alloy pipe shall conform to ASTM B 241, alloy 6061, temper condition T6.

709.35-ALUMINUM ALLOY RIVETS:

Aluminum alloy rivets shall conform to Military Specifications MIL-R-5674; grade and head style shall be as specified by the Engineer.

709.36-ALUMINUM ALLOY BOLTS, NUTS AND SET SCREWS:

Aluminum alloy bolts and set screws shall be made from rod conforming to ASTM B 211, alloy 2024, temper condition T4. The aluminum alloy nuts shall be made from rod conforming to either ASTM B 221, alloy 6061, temper

condition T6 or ASTM B 211, alloy 6061, temper condition T6.

Bolt head and nuts shall conform to the American Standard Regular Hexagon, ASA Specifications B 18.2 with the following modification: the width across the flats and the width across the corners may exceed the maximum given in the specification tables by an amount no greater than 20 percent of the difference between the maximum and minimum values given in the tables.

Threads shall conform to American Standard Coarse Thread Class 2. The finished product shall be in the fully heat-treated and aged condition. Anchor bolts shall be given a clear anodic coating at least 0.0002 in (5 μ m). thick. Exposed nuts and washers need not be given an anodic coating.

709.37-ALUMINUM ALLOY WASHERS:

Aluminum alloy washers shall be made from sheet conforming to ASTM B 209, Alclad 2024, temper condition T3 or T4 depending upon the thickness supplied.

709.38-BLANK

709.39-ALUMINUM ALLOY SAND CASTINGS:

Aluminum alloy sand castings shall conform to **Table 658.4.3.**

709.40-ALUMINUM ALLOY SHIM MATERIAL:

Aluminum alloy shims shall be made from sheet or plate conforming to ASTM B 209, alloy 1100, temper condition 0.

709.41-ALUMINUM FILLER METAL FOR WELDING:

Aluminum filler metal for welding shall conform to ASTM B 285, alloy ER 4043.

709.42-GALVANIZED PIPE OR TUBING FOR HORIZONTAL DRAINS:

709.42.1-General: Horizontal drains may be of galvanized welded or seamless steel pipe, or galvanized tubing, conforming to the requirements prescribed.

The outside diameter shall be a nominal diameter of 2 inches (50 mm) or greater, and the wall thickness shall be a minimum of 0.043 in. (1 mm). The material shall be perforated. Perforations shall consist of two rows of $3/16$ in. $\pm 1/32$ in. (5 mm ± 1 mm) diameter holes along the length of the pipe or tubing.

The holes in each row shall be on 2 inches $\pm 1/4$ in. (50 mm ± 6 mm) centers. The row shall be 110 deg apart.

The material may be furnished in random or regular lengths.

709.42.2-Galvanized Welded or Seamless Steel Pipe:

Galvanized welded or seamless steel pipe shall conform to the requirements

709.42.3

of ASTM A 53. The hydrostatic test will be waived.

709.42.3-Galvanized Tubing: Galvanized tubing shall be circular in cross section with a welded seam. The base metal shall conform to the requirements of Table 1, AASHTO M 218M. The outside surface of the weld shall be metalized.

709.43 THROUGH 709.44-BLANK

709.45-GALVANIZED STEEL GUARDRAIL POSTS:

Steel guardrail posts shall be fabricated from steel meeting the requirements of AASHTO M 183 or fabricated in accordance with ASTM A 769, Grade 40.

They shall be of a section, length and weight as specified on the Plans. The weight shall not be less than 97.5 percent of that specified.

Galvanizing shall be in accordance with AASHTO M 111, with a minimum of 2 oz. per square foot (600 grams per square meter).

709.46-STEEL POSTS, POST BRACES AND GATE FRAMES FOR RIGHT-OF WAY FENCE:

End, pull, corner, gate, intermediate assembly, special length line posts, post braces and gate frames shall be either (a) galvanized steel pipe meeting the requirements of ASTM A 53, with hydrostatic pressure test requirements waived, or (b) triple-coated steel pipe meeting the requirements for Class 2 pipe in AASHTO M 181. Either type may be used unless one type is specifically called for in the contract. Pipe members shall have the dimensions and weights called for on the Plans. In addition, for chain link fence only, roll formed members, having the dimensions and weights called for on the Plans and meeting the applicable requirements in 712.8 of the Specifications, may be used in lieu of pipe posts and pipe braces as shown on the Plans.

Line posts for farm-field fence shall conform to the requirements of AASHTO M 281. Line posts for chain-link fence shall conform to the requirements shown on the Plans. All line posts shall be galvanized. A tolerance of five percent in weight will be allowed on all fence posts.

709.47-BLANK

709.48-CADMIUM COATED MATERIALS:

Cadmium coated (electrodeposited) steel articles, steel hardware, nuts, bolts, etc. shall meet the requirements of ASTM B766.

709.49-SHEET LEAD:

Sheet lead shall conform to the requirements of ASTM B 29.

709.50-STEEL PILE POINTS:

Steel pile points may be either ASTM A27 Grade 65/35 cast steel or ASTM A148 Grade 90/60. Pile points will be approved by the Materials Control, Soil

and Testing Division.

SECTION 710 WOOD MATERIALS

710.1-STRUCTURAL MATERIALS:

Timber, lumber, piles, posts, and blocks shall meet the requirements of AASHTO M168. Preservation and Treatment plants shall meet the requirements of the Book of Standards of the American Wood-Preservers' Association (AWPA).

710.2-SPECIES AND GRADE:

710.2.1-Structural softwood shall meet the requirements of the Southern Pine Inspection Bureau (SPIB) grading rules. All wood for structural use shall be visually or mechanically graded for the requirements shown on the Plans or specified in the contract.

710.2.2-Structural hardwood shall meet the requirements of AASHTO M168 or the Northeastern Lumber Manufacturers Association (NeLMA) structural grades. The grade and species required shall be as shown on the Plans or specified in the contract.

710.2.3-Hardwood used for bridge decking shall meet the Standards of the National Hardwood Lumber Association (NHLA) for sound square edge, be rough sawn and sized by being processed through a hit or miss surfer.

710.2.4-All graded material may either carry the appropriate grade stamp, or be inspected by an independent inspection agency approved by the Division.

710.3-PRESERVATIVE TREATMENT:

All timber products requiring preservative treatment by pressure processes shall meet the requirements of AWPA C1 in addition to the specific requirements listed below.

710.3.1-All hardwood for highway construction shall meet the requirements of AWPA C2.

710.3.2-All softwood for highway construction shall meet the requirements of AWPA C14.

710.3.3-All wood products for commercial construction shall meet the requirements of AWPA C15.

710.3.4

The quantity of preservative shall be as required above, unless modified by the Plans or purchase order.

710.3.4-The preservative shall be one of the following:

710.3.4.1-Coal tar creosote meeting AWP A P1. Creosote shall be analyzed by AWP A A1.

710.3.4.2-Waterborne meeting AWP A P5. Waterbornes shall be analyzed by AWP A A2 and/or A9.

710.3.5-Preservative retention shall be determined by gauge or assay. The gauge method shall be approved by the Division for each treatment plant. The assay methods shall be as follows:

710.3.5.1-Coal tar creosote by AWP A A6.

710.3.5.2-Waterborne by AWP A A11.

710.4-TREATMENT PLANTS:

Material treated with preservative may be purchased from certified or noncertified plants. Both type of plants shall adhere to the quality control procedures of AWP A M2.

710.4.1-Certified Plants: The Division's procedure for plant certification is defined in MP 710.01.40.

710.4.2-Noncertified Plants: Material purchased from noncertified plants will be tested on a lot by lot basis. The inspection shall be performed by a Division approved inspection agency. The cost of the inspection will be paid by the supplier. Shipments from noncertified plants shall be documented as described in MP 710.01.40.

710.5-WOOD POSTS:

Wood posts shall meet the requirements of ASSHTO M168 except round posts may be used for guardrail.

710.5.1-Round posts for guardrail shall meet the requirements of Section 5 "Material Requirements" of ANSI 05.1. Round posts for guardrail shall be from the major or minor species of Southern Pine.

710.5.2-Rectangular posts for guardrail shall be No. 1 major or minor species of Southern Pine as defined in Section 400 of the SPIB grading rules.

710.5.3-Dimensions of all guardrail posts except as noted on the Plans shall be as follows:

Round Guardrail Posts

Diameter: 7" $\pm \frac{1}{4}$ " (177 mm \pm 6 mm) throughout the length except as noted on Plans.
 Length: 6' $\pm \frac{1}{2}$ " (1 828 mm \pm 13 mm)

Rectangular Guardrail Posts

Size: 6" $\pm \frac{1}{4}$ " X 8" $\pm \frac{1}{4}$ " (152 mm \pm 6 mm by 203 mm \pm 6 mm) throughout the length except as noted on Plans.
 Length: 6' $\pm \frac{1}{2}$ " (1 828 mm \pm 13 mm)

710.5.4-Dimensions of wood posts for fence and signs shall be as shown on the Plans.

710.6-PLYWOOD:

710.6.1-Plywood shall meet the requirements of Product Standard PS-1 of U.S. Department of Commerce. All plywood shall be identified with the mark of a qualified inspection and testing agency. The identification shall include:

710.6.1.1-Species group classification, or class number, or span rating, depending on grade.

710.6.1.2-Either interior or exterior.

710.6.1.3-Grade name or grade of face and back veneers.

710.6.1.4-The symbol PS-1 signifying conformance with the standard.

710.6.2-Exterior plywood shall be bonded with exterior glue and the veneers used in manufacture cannot be less than grade C as defined in PS-1.

710.7-COMMON LUMBER:

710.7.1-Common lumber is untreated and suitable for general construction and utility purposes. Common lumber is from 2 inches (50 mm) to but not including 5 inches (125 mm) thick and is 2 inches (50 mm) or more in width. Common lumber shall be grade 2 or better when graded by the Board of Review of the American Lumber Standards Committee.

710.8

710.8-SERVICE AND LIGHTING POLES:

710.8.1: Wood Service or lighting poles shall be ANSI Class 5, or larger, or as called for on the contract plans. Lighting poles shall be southern yellow pine and service poles shall be either southern yellow pine or Douglas fir. The poles shall be pressure-treated with copper chromium arsenate (CCA) to meet the requirements of AWPA C-14.

SECTION 711 PAINTS, COATINGS, OILS, AND INKS

Paints shall consist of pigments and vehicles conforming to the general requirements of these specifications, proportioned and treated to produce materials possessing the detailed composition and physical properties.

General Requirements: The finished products shall not settle excessively nor cake in the container, shall be readily mixed with a paddle to a smooth uniform paint of specified consistency and working properties. The product shall not thicken, liver, skin, or curdle. The paint shall have a storage life of at least 12 months.

All ready mixed paints shall be furnished in containers holding not more than five gallons (20 liters) , unless authorized by the Engineer. Shop paints may be furnished in larger containers providing approved mechanical agitation is available.

Each container shall bear a label with the following information: Name and address of the manufacturer, trade name or trade mark, type of paint, reference to the Division's Standard Specification Number, number of gallons (liters), lot or batch number, date of manufacture, and flash point. The label of two component systems shall include mixing instructions.

Sampling and testing shall be in accordance with MP 711.00.20. Quantities of 50 gallons (200 liters) or less may be accepted on manufacturer's certification.

711.1-BLANK

711.2-BOILED LINSEED OIL:

Boiled linseed oil shall conform to the requirements of ASTM D 260.

711.3 THROUGH 711.4-BLANK

711.5-MINERAL SPIRITS:

Mineral spirits shall conform to the requirements of ASTM D 235.

711.6-FIELD PRIMER:

711.6.1-General: Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. This primer may be used in the shop on new steel or in the field on existing steel. The shop primer shall have a minimum slip coefficient of 0.50 (Class B) when tested in accordance with "Test Method to Determine the Slip Coefficient for Coatings used in Bolted Joints" as adapted by the Research Council on Structural Connections. The steel shall be capable of being blast cleaned to a near-white finish, SSPC-SP-10, for new steel, and to a commercial finish, SSPC-SP-6, for existing steel. This primer may be top coated in accordance with Section 711.20.1. The dry film thickness requirement for this material is three mils (75 μm) minimum unless specified otherwise.

711.6.2-This primer shall meet the requirements of SSPC, Paint Specification Number 20, Type 2.

711.7-FIELD OR SHOP PRIMER:

711.7.1-General: Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. Subsequent approval of initially accepted products may be based on random testing (all tests not required on each batch) at the option of the Division. This specification provides the requirements for a fast drying shop or field primer. This primer may be used on new steel painted in the shop or as a field primer on existing bridges. In both cases, the steel must be capable of being blast cleaned to a near white condition, SSPC-SP-10. The dry film thickness requirement for this material is two mils (50 μm) minimum unless specified otherwise.

711.7.2-This primer shall meet the requirements of Federal Specification TTP-664 (C) with the exception that the minimum dry to touch time shall be deleted and the maximum increased to 10 minutes.

711.8-FIELD PRIMER-SLOW DRYING:

711.8.1-General: Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. Subsequent approval of initially accepted products may be based on random testing (all tests not required on each batch) at the option of the Division. This specification provides the requirements for a slow drying field primer. This primer is to be used on existing structures which are corroded to such an extent that they cannot be blast cleaned to a commercial condition, SSPC-SP-6. The primer has the ability to "wet" hand cleaned steel. The dry film thickness requirement for this material is two mils (50 μm) minimum unless specified otherwise.

711.8.2-This primer shall meet the requirements of SSPC, Paint Specification Number 25 with the following exceptions:

711.9

- i. DELETE Tack Free Dry Time. SUBSTITUTE Set-To-Touch Time.
- ii. DELETE II-R266, Type II. SUBSTITUTE TT-R266, Type I, Class A or Class B.
- iii. CHANGE Maximum dry hard from 24 to 36 hours.

711.9-BLANK

711.10-INTERMEDIATE FIELD COAT:

711.10.1-General-Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. Subsequent approval of initially accepted products may be based on random testing (all tests not required on each batch) at the option of the Division. This specification provides the requirements for an intermediate field coat or coats for use in mild or average atmospheric conditions. This paint may be applied over 711.7 or 711.8 primers. It is to be top coated with a pigmented finish coat meeting 711.11. The dry film thickness requirement for this material is two mils (50 µm) minimum unless specified otherwise.

711.10.2-This paint shall meet the following requirements:

	<u>Minimum</u>	<u>Maximum</u>
i. Viscosity (KU)	75	90
ii. Fineness of Grind	4	
iii. Drying Time (hours)		
Set to Touch		6
Dry Hard		18
iv. Gloss @ 60°		50
v. Pigment, percent by weight	38	
vi. Non-Volatile, percent of vehicle	40	
vii. Color shall be light gray		
viii. Weight - The weight per gallon (liter) of the paint shall be within ±0.5 pounds (±225 grams) of the initial qualification sample.		
ix. Adhesion - When tested in accordance with ASTM D3359 the adhesion shall not be less than 3B when the total film thickness is 5 mils (125 µm) or less. Thickness in excess of 5 mils (125 µm) require a minimum adhesion of 3A.		

711.11-PIGMENTED FINISH COAT:

711.11.1-General: Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. Subsequent approval of initially accepted products may be based on random testing (all tests not required on each batch) at the option of the Division. This specification provides the requirements for a

711.11.2

pigmented finish coat or coats for use in mild or average atmospheric conditions. This finish coat is to be applied over 711.10. The field adhesion of the system (primer, 711.10, 711.11) shall be at least 90 percent when tested in accordance with MP 711.00.20. The adhesion test shall be conducted approximately 14 days after field application. The dry film thickness requirement for this material is two mils (50 μm) minimum unless specified otherwise

The color choices permissible are from Federal Standard 595. The color difference, ΔE , of the acceptance samples shall not be more than five ΔE units from the standard listed below.

Federal Standard Number	x Coordinates	y Coordinates	Y Coordinates
14062	.2361	.4376	04.13
14223	.2883	.3911	20.24
17178	.3059	.3169	31.46
14241	.2915	.3382	27.75

711.11.2-Physical Requirements:

		<u>Minimum</u>	<u>Maximum</u>
i.	Viscosity (KU)	70	80
ii.	Fineness of Grind	6	
iii.	Drying Time (hours)		
	Set to Touch		4
	Dry Hard		18
iv.	Gloss @ 60°	50	
v.	Pigment, percent by Weight	25	
vi.	Non-Volatile, percent of vehicle	44	
vii.	Accelerated Weathering -		
	Color change shall not exceed the five ΔE units after 500 hours exposure.		
viii.	Weight - The weight per gallon (liter) of the paint shall be within ± 0.5 pounds (± 225 grams) of the initial qualification sample.		
ix.	Flexibility - There shall be no apparent failure when viewed under 8X magnification after bending around $\frac{1}{4}$ inch (6 mm) mandrel.		
x.	Adhesion - When tested in accordance with ASTM D3359 the adhesion shall have minimum rating of 3A.		

711.12-EPOXY MASTIC MAINTENANCE COATING:

711.12.1-General: This specification provides the requirements for a two components, modified epoxy coating for use as a spot primer or a one coat system for use on poorly prepared surfaces on most existing structures. All ingredients are not specified, however, the finished product shall comply with the requirements prescribed.

711.12.2-Composition: The pigment shall be flake metallic aluminum. The vehicle shall be modified epoxy resin and curing agent. The vehicle shall be formulated to permit trouble free application during normal humidity conditions.

711.12.3-Physical Requirements:

- i. Dry to touch @ 5 mils (125 µm) dry 24 Hours Maximum
- ii. Dry hard @ 5 mils (125 µm) dry 72 Hours Maximum
- iii. Weight per gallon (liter) 10.5 Lbs. Minimum
- iv. Corrosion resistance

Steel panels meeting the requirements of MP 711.00.20, Section 5.2 shall be sandblasted to a white metal finish in accordance with SSPC-SP-5, exposed to the atmosphere for 30 days so uniform rusting occurs, and then hand cleaned with a wire brush in accordance with SSPC-SP-2. The panel shall then be spray applied with epoxy-mastic according to manufacturers' recommendations.

Fresh Water Resistance: The coated panels shall be scribed to the base metal with an X of at least two inch (50 mm) legs and shall be immersed in fresh tap water at 75 ± 5° F (24 ± 3° C). Upon examination after 30 days immersion, the panels shall be unaffected except for discoloration's of the epoxy-mastic coating. There shall be no blistering, softening, or visible rusting beyond 1/16 inch (2 mm) from the edge of the scribe mark.

Salt Water Resistance: Panels shall be scribed to the base metal with an X of at least two inch (50 mm) legs and shall be immersed in five percent sodium chloride solution at 75 ± 5° F (24° C ± 3° C). The panels shall be unaffected except for discoloration of the epoxy-mastic coating, upon inspection after 30 days. There shall be no blistering, softening or visible rusting beyond 1/16 inch (2 mm) from the center of the scribe mark. The sodium chloride solution shall be replenished with fresh solution each week.

Weathering Resistance: Panels shall be tested in accordance with ASTM G 53. After 1,000 hours exposure, the coating shall show no rusting, blistering, or loss of adhesion to the test panel.

Salt Fog Resistance: Panels shall be scribed to the base metal with an X of at least two inch (50 mm) legs. The test panels shall then be tested in accordance with ASTM B 117. After 1,000 hours of continuous exposure, the coating shall show no loss of bond, nor shall it show rusting or blistering beyond 1/16 inch (2 mm) from the center of the scribe mark.

v. Flexibility

The epoxy-mastic coating shall possess such flexibility that when applied at a five mil (125 μm) dry film thickness to a 1/8 inch (3 mm) steel panel which has been blast cleaned in accordance with SSPC-SP-5, and dried for two weeks at $75 \pm 5^\circ \text{F}$ ($24^\circ \text{C} \pm 3^\circ \text{C}$) shall display no signs of cracking or loss of adhesion when the panel is uniformly bent 180 degrees around a 1/8 inch (3 mm) diameter mandrel.

vi. Application Properties

The paint shall be suitable for use over properly prepared zinc rich primers. The mixed paint, when thinned in accordance with manufacturer's recommendations, shall be capable of being sprayed in one coat at a 10 mil (250 μm) wet film thickness without runs or sags. The properly thinned paint shall be capable of brush and roller application. The manufacturer's current printed instructions for application of epoxy-mastic coating shall be submitted to the Division for review and approval prior to application.

711.12.4-Packaging and Labeling: The epoxy-mastic coating shall be packaged in two containers, labeled Part A and Part B. Each container shall bear a label on which shall be clearly shown the manufacturer and brand name of paint, the lot number, and the date of manufacture. The label on the containers shall also include complete instructions for the use of this paint. The inside of the container shall be coated, if necessary, to prevent attack by the paint components.

711.12.5-Acceptance Procedure: The Division will develop an approved list of products meeting this specification.

The list shall be based upon testing performed by the Division or by certified test data supplied by the manufacturer. The manufacturer shall supply the Materials Division the following for each product.

- i. Two one gallon (4 liter) kits of the product
- ii. One gallon (4 liter) thinner
- iii. Instructions for mixing, thinning and application

711.13

- iv. Materials Safety Data Sheet for both the paint and thinner
- v. Company data sheet on the product

After successful testing, the Materials Division will inform the manufacturer of inclusion on the approved list. Upon approval by the Division, further testing will not be required of the brand name of paint, unless random samples tested by the Division show non-compliance with any of the specification requirements. The manufacturer shall submit certified test data anytime the formulation or manufacturing process changes.

711.12.6 – Colored epoxy-mastic shall meet the above requirements with the following changes:

- i. The metallic aluminum pigment shall be replaced by other pigments and coloring agent necessary to provide the specified color. The color difference, ΔE , of the acceptance samples shall not be more than 5 ΔE units from the standards listed below.

FEDERAL STANDARD NUMBER	X Coordinates	y Coordinates	Y Coordinates
14062	.2361	.4376	04.13
14223	.2883	.3911	20.24
14241	.2915	.3382	27.75
17178	.3059	.3169	31.46
30045	.3555	.3324	6.88

- ii. Due to the fading tendencies of the colored epoxy-mastics, all material must come from the same batch.

711.13-INKS:

Inks for use on reflective sheeting shall be as recommended by the manufacturer of the reflective sheeting.

711.13.1-Transparent Ink:

711.13.1.1-Color: The color shall meet the requirements of Table 1 and be tested in accordance with Section 7.1 of AASHTO M268.

711.13.1.2-Black Ink: Black Ink shall be opaque process ink made with synthetic resin.

711.13.3-Clear Transparent Ink: Clear transparent ink for application as a final protective coat shall be as recommended by the manufacturer of the

reflective sheeting.

711.14 – OVERCOAT SYSTEMS:

711.14.1 – General: This specification provides paint systems which may be used with minimal surface preparation.

711.14.2 – Cleaning and Painting: Surface preparation will be limited to hand or power tool cleaning meeting SSPC-SP-2 or SSPC-SP-3. Application of the paint system shall be in accordance with the manufacturer's recommendations.

711.14.3 – Acceptance: The Division will maintain an approved list of overcoat system.

711.15 THROUGH 711.19 - BLANK

711.20-INORGANIC ZINC RICH SYSTEM:

711.20.1-General: Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. Subsequent approval of initially accepted products may be based on random testing (all tests not required on each batch) at the option of the Division. This specification provides the requirements for an inorganic zinc rich system. The primer is to be spray applied over a near white blasted surface, SSPC-SP-10. An intermediate coat meeting 711.20.3 may be needed to tie the primer and the top coat together. **The use of an intermediate coat shall be the option of the top coat manufacturer.** In either case, the field adhesion of the system shall be at least 90 percent when tested in accordance with MP 711.00.20. The adhesion test shall be conducted approximately 14 days after field application.

711.20.2-Primer: This primer shall meet the requirements set forth in MP 711.20.59 with the following changes (number refers to sub-section of AASHTO M 300):

- 4.2.2** Delete X-ray diffraction
- 4.6.8** Delete accelerated weathering
- 4.6.9** Delete bullet hole immersion test
- 4.6.10** Delete humidity test
- 4.7** Delete primer field performance requirement
- 4.8.5** Delete infrared spectrum

711.20.3

4.8.6 Delete the VOC (volatile organic compound) requirement and substitute the following: The VOC shall not exceed 3.5 lbs / gal (420 kg / m²) for shop or field application

The primer shall have a minimum slip coefficient of 0.50 (Class B) when tested in accordance with "Test Method to Determine the Slip Coefficient for Coatings used in Bolted Joints" as adapted by the Research Council on Structural Connections.

711.20.3-Intermediate Field Cost: The material shall meet the requirements set forth in MP 711.20.60.

711.20.4-Top Coat: This top coat shall meet the manufacturer's specifications and shall meet the physical requirements of 711.20.4.1.

711.20.4.1-Physical Requirements:

	Minimum	Maximum
i. Drying Time (hours)		
Set-to-touch	---	1
Dry for recoating	---	3
Dry Hard	--	24
ii. Flexibility		
(½ in. (13 mm) mandrel)		No Failure
iii. Compatibility - 50 cu. cm. of the coating shall be able to be mixed with 50 cu cm of the manufacturer's thinner without curdling, livering, separating, or otherwise affecting the coating except to thin it.		

Color - The color choices permissible are from Federal Standard 595.

The color difference, ΔE, of the acceptance samples shall not be more than five units from the Standards listed below:

Federal Standard Number	x Coordinates	y Coordinates	Y Coordinates
14062	.2361	.4376	04.13
14223	.2883	.3911	20.24
14241	.2915	.3382	27.75
17178	.3059	.3169	31.46
30045	.3555	.3324	6.88

iv. Accelerated Weathering - After cycling 1000 hours there shall be no evidence of checking, cracking, rusting, or blistering. The degree of

chalking shall not be less than No. 6 when tested according to ASTM D6549. The color difference after 1000 hours shall be no more than five ΔE units.

- v. Chemical Resistance - The top coat shall show no visual deterioration, other than minor discolorations, after seven days exposure to:
 - a. Ten percent sulfuric acid solution
 - b. Ten percent sodium hydroxide solution
- vi. Adhesion - When tested in accordance with ASTM D3359 the adhesion shall have minimum rating of 3A.
- vii. Gloss - less than 25 (for color 30045 only).

711.21-GALVANIZE REPAIR (ZINC RICH PRIMER):

Acceptance shall be based on batch testing. Initial approval of all material will be based on complete testing to assure specification compliance. Subsequent approval of initially accepted products will be based on random testing (all tests not required on each batch) at the option of the Division. This primer shall meet the requirements of Military Specification MIL-P-21035, Federal Specification TTP-641, Section 711.6, or Section 711.20.2.

711.22-INORGANIC ZINC RICH LOW VOC SYSTEM:

711.22.1-General: Initial approval for all material will be based on complete testing of the system for specification compliance. Subsequent approval of initially accepted products may be based on random testing (all tests not required on each batch) or from an approved list at the option of the Division. Each product in the system shall have a maximum Volatile Organic Compound (VOC) content. Each product in the system shall be from the same manufacturer. The primer is to be spray applied over a near white blasted surface, SSPC-SP-10. An intermediate coat meeting 711.22.3 may be needed to tie the primer and the top coat together. The use of the intermediate coat shall be at the option of the manufacturer. In either case, the field adhesion of the system shall be at least 3A when testing in accordance with MP 711.00.20. The adhesion test shall be conducted approximately 14 days after application of the top coat.

Two low VOC systems are covered by this specification. They are as follows:

System 1 - All products are to have a VOC of 2.8 pounds per gallon maximum (336 gm per liter).

System 2 - All products are to have a VOC of 2.8 pounds per gallon (336 gm per liter) maximum except the primer has no restrictions on VOC.

All fabricators/contractors will be required to use the same system formulation on a specific structure.

711.22.2

711.22.2-Primer: This primer shall meet the requirements of 711.20.2.

711.22.3-Intermediate Field Coat: This material shall meet the manufacturer's specification and shall be compatible with the primer (711.22.2) and the top coat (711.22.4).

711.22.4-Top Coat: This material shall meet the manufacturer's specification and shall meet the requirements of 711.22.4.1.

711.22.4.1-Requirements:

- i. Dry Hard - 24 Hours Maximum
- ii. Color - Shall meet the requirements of 711.20.4.1 (iv).
- iii. Gloss @ 60° - 50 Minimum

711.22.5-The system shall be composed of a primer (711.22.2) and topcoat (711.22.4). The use of an intermediate coat is at the option of the manufacturer. The primer shall be applied at a minimum of 3 mils (75 µm) dry. The total coating over the primer shall be a minimum of 4 mils (100 µm) dry.

711.22.5.1-System Requirements:

- i. Intercoat Adhesion - Before and after all tests, the intercoat adhesion shall be at least 3A when tested in accordance with MP711.00.20.
- ii. Accelerated Weathering - After cycling 1000 hours there shall be no evidence of checking, cracking, rusting, or blistering. The degree of chalking shall not be less than No. 6 when tested according to ASTM D6549. The color difference after 1000 hours shall be no more than five ΔE units.
- iii. Salt Spray - After cycling for 1,000 hours, the intercoat adhesion shall meet 711.22.5.1 i.

711.25 THROUGH 711.39-BLANK

711.40 – Temporary White or Yellow Traffic Paint:

Temporary Traffic Paint shall be any commercially available white or yellow paint designed for use on highways. The paint shall be applied at a minimum rate of 15 mils (381 µm) wet film thickness. The paint shall be applied with glass beads at a minimum rate of 6 lbs per gallon (720 grams per liter) of paint. The beads shall be any glass spheres designed to be applied to the above paint. The paint shall have a minimum retroreflective reading of 150 mc/lx/m² within three to ten days after application. During this period readings shall be preformed by Division personal. A minimum of three readings shall be taken with the LTL 2000 Retroreflectometer. Testing shall be in accordance

with ASTM E1710 *with the following changes*(number refers to subsection of ASTM E1710).

6.2.2 – DELETE THE SENTENCE AND SUBSTITUTE THE FOLLOWING:

The aperture angle of the light source as determined from the center of the measurement area shall be a maximum of 0.33.

6.3.3 – DELETE THE SENTENCE AND SUBSTITUTE THE FOLLOWING:

As determined from the center of the measurement area the aperture angle of the receiver shall be a maximum of 0.33.

Should the paint fall below 150 mc/1x/m² the contractor shall repaint at no additional cost to the division.

711.41-WHITE OR YELLOW FAST-DRY TRAFFIC PAINT (TYPE II)

711.41.1-General: The pavement marking material shall be formulated as a medium-life pavement marking system capable of providing a minimum of one year of continuous performance. Solvent born paint, methylmethacrylate, chlorinated rubber, or other short duration products will be not approved.

The composition of the paint shall be left to the discretion of the pavement marking manufacturer. The Contractor shall provide a pavement marking system to meet the following performance requirements:

COLOR: Each color installed shall match the following Federal Standards:

Yellow: No. 595A-33538

White : No. 59S A-37875

The color shall show no appreciable discoloration due to aging during the life of this pavement marking. Pavement markings shall be visually checked by the Engineer at any time during the life of this pavement marking, additionally, the Engineer may at any time during the projected life of this marking use a portable colorometer to determine if the markings have faded or darkened beyond the CIE Chromaticity Coordinate Limits.

711.41.2-Sampling and Testing Procedures for Performance Samples:

The pavement marking system installed, shall at all times with maintain a minimum reflectance value of 200 mcd/m²/lx for white pavement markings and 150 mcd/m²/lx for yellow pavement markings when measured with a

711.41

LTL-2000 retroreflectometer or equal 30 meter device approved by the Traffic Engineering Division.

During the pavement marking life-span, the pavement marking materials furnished and installed shall show no signs of failure greater than five (5) percent loss due to blistering, excessive cracking, bleeding, staining, discoloration, smearing or spreading under heat, deterioration due to contact with oil or gasoline, chipping, spalling, poor adhesion to the pavement, damage from traffic and normal wear. Loss due to pavement failure, unless caused by the marking material, will not be considered as a material failure and will not be included in the loss calculations and/or retroreflectivity readings.

The Division may conduct periodic pavement marking reviews throughout the project. These reviews will occur at any time after the markings have been placed. These reviews will evaluate the pavement marking material within the project limits for either day and night acceptability considering all requirements listed above. The following method will be used to measure the retroreflectivity acceptance of the pavement marking material:

Identified deficient areas greater than 1000 ft shall be labeled as zones and these areas shall be checked for retroreflectivity. Areas less than 1000 ft shall be addressed on an individual basis concerning deficient markings.

Zones of less than one mile in length may have from one to three check points at the discretion of the Department. Check points will consist of six skip lines or 300 feet of continuous marking. For each check point eighteen (18) retroreflective readings will be taken over the six skip lines or 300 feet of continuous line. Areas less than 1000 feet shall be checked every 100 feet with the average to be the determination of the retroreflectivity level.

Zones one to three miles in length will have readings taken at a minimum of three check points within the zone. The check points should be located at the beginning, middle and end portions of the zone in question.

Zones greater than three miles in length will have check points at the beginning, end and at three mile intervals within the zone.

Retroreflective readings within each check point and zone will be averaged. If any of the check point averages and/or zone averages fall below the defined minimum retroreflective values, additional zones may be used for further evaluation of the markings to be replaced. The average zone value will be used to determine conformance to the defined minimum values.

During the life of this pavement marking if any markings greater than 1000 feet are found to be deficient for any reason, the Contractor will be given notification stating the locations and the type of deficiency. These notifications will be given at any time during the life of the contract. The Contractor shall completely replace the deficient markings, as directed by the Engineer, within twenty (20) calendar days of the written notification.

If the Contractor Does Not complete the replacement of all of the deficient pavement markings by the end of the twenty (20) calendar day replacement period the Contractor shall be subject to the liquidated damages as described within Section 108.7 of the West Virginia Department of Highway's Standard Specifications until replacement is completed. These liquidated damages shall

not stop during the winter shut-down period. No direct payment shall be made for the replacement of any deficient pavement marking during the one-year warranty period as such work shall be considered as incidental to the work as paid for by the various pavement marking items in the contract.

711.41.2.1- Submission For Approval of Equipment Personnel:

The Contractor (prior to commencement of the project) shall submit to the Engineer a detailed list of all equipment and the resumes of all personnel within the confines of this project. The Contractor shall also provide certification from the binder manufacturer that the Contractor is qualified to apply the manufacturer's material in conformance with these specifications. Drivers and operators with less than one year of experience shall not be used on this project.

The Contractor will be required to fill out the Daily Centerline Report(s) and provide the completed form to the Engineer for payment. The Contractor shall provide the District the collective daily centerline reports on a weekly basis. The Contractor's weekly centerline reports shall be delivered to the Engineer the first work day of the following week. Failure to deliver centerline reports to the District shall invoke daily liquidated damages as described in Section 108.7 of the West Virginia Department of Highway's Standard Specifications for each calendar day that the Contractor fails to deliver these centerline reports.

711.41.2.2-Application of Performance Pavement marking Materials:

The Contractor's striper shall be equipped with electrical foot counters. The counters shall individually tabulate the amount of footage applied by each striping gun whether solid or dashed. The counters shall be six digit types with a reset feature. The Contractor shall determine the accuracy of the foot counters and establish an adjustment factor as required to determine the pay item quantities. The foot counters shall be periodically checked to assure accurate measurements. No paint shall be applied without the accurate operation of the foot counters. The Contractor shall provide the Engineer with a certified document on these calibrations.

The Contractor shall use an accurate dashing mechanism, capable of being adjusted to retrace existing lane or center line markings.

The pavement marking material shall be mixed uniformly throughout and shall have a homogeneous dispersement of color and beads when applied to the pavement. The material shall have a uniformly thick cross-section through its entire length.

Pavement marking lines shall be straight or of uniform curvature and shall conform with the tangents, curves, and transitions as specified in the pavement marking standards and/or as directed by the Engineer.

The finished lines shall have well-defined edges and be free of horizontal fluctuations. The lateral deviation shall not exceed 0.5 inch from the proposed location alignment as specified in the Standards and/or directed by the Engineer.

712.1

When striping interchanges, material will be applied for the full length of all ramps, including all islands, gore areas, etc.

The Contractor shall be responsible for removing all pavement marking materials spilled upon the roadway surface or adjoining area. The Contractor shall use methods acceptable to the Engineer for removing the spilled material. The Department will be responsible for coding and spotting where old markings cannot be determined or if the Department desires to make changes in existing markings.

SECTION 712 GUARDRAIL AND FENCE

712.1 THROUGH 712.3-BLANK

712.4-GALVANIZED STEEL DEEP BEAM GUARDRAIL, FASTENERS AND ANCHOR BOLTS:

Galvanized steel deep beam guardrail, fasteners and anchor bolts shall conform to AASHTO M180, Type II, Class A.

712.5 THROUGH 712.7-BLANK

712.8-CHAIN-LINK FENCE:

Chain-link fence shall conform to the requirements of AASHTO M 181. Fence height, gage and details shall be as specified on the Plans.

712.9-ZINC-COATED (GALVANIZED) IRON OR STEEL FARM- FIELD AND RAILROAD RIGHT-OF-WAY WIRE FENCING:

This fencing shall meet the requirements of AASHTO M 279 and details shown on the Plans. Either of the following styles and coating classes may be used.

1. Style 1047-6-9 with Class 1 coating
2. Style 1047-6-11 with Class 3 coating

Zinc coating for miscellaneous steel fittings and hardware shall conform to the requirements of AASHTO M 232. Zinc coating for clips used for securing fence or wire shall conform to AASHTO M 279, Class 1 coating.

712.10-COATED STEEL BARBED WIRE:

Barbed wire shall meet the requirements of AASHTO M 280, Class 1 or AASHTO M 305, Type I.

SECTION 713

METAL PIPE

713.1-BLANK

713.2-METALLIC COATED CORRUGATED STEEL PIPE AND PIPE ARCH:

Metallic coated corrugated steel pipe and pipe arch shall conform to the requirements of AASHTO M 36 for Type I and Type II pipe.

Special sections, such as elbows, for these conduits shall be of the same gage as the conduit to which they are jointed, and shall conform to the applicable requirements of AASHTO M 36.

713.3-BITUMINOUS COATED CORRUGATED STEEL PIPE AND PIPE ARCH:

Bituminous coated corrugated steel pipe, pipe arches, coupling bands, elbows, and other special sections shall conform to the requirements of AASHTO M 190. Coating and invert paving shall be of the type specified.

713.4-FULL BITUMINOUS COATED AND FULL PAVED CORRUGATED STEEL PIPE:

The pipe shall conform to the applicable requirements of AASHTO M 190 and in addition thereto, when riveted corrugated steel pipe is used, the rivets shall be placed on the outside crests of corrugations. Bituminous coating shall be in accordance with the requirements for Type A; the paving shall be in accordance with the requirements for Type B except that the pavement shall be formed on the inside for the entire circumference of the pipe. Smooth lined pipe over 30 inches (750 mm) in diameter shall have lifting lugs attached to each section when manufactured.

713.5-FIBER BONDED FULL BITUMINOUS COATED CORRUGATED STEEL PIPE AND PIPE ARCH:

713.5.1-Type A, Fiber Bonded Full Bituminous Coated: Fiber bonded full bituminous coated conduits shall comply with the requirements of AASHTO M 36 for base metal, and fabrication where applicable. The conduit shall be formed from sheets which have been coated on both sides with a layer of aramid fibers, applied in a sheet form by pressing them into a molten metallic bonding medium. Immediately after the metallic bond has solidified, the fibers shall be thoroughly saturated with a bituminous saturant. The finished sheets shall be of first class commercial quality, free from blisters and unsaturated spots. In addition, the conduit shall be coated inside and out with a bituminous material complying with the requirements of AASHTO M 190, Type A.

713.5.2-Type C, Fiber Bonded Full Bituminous Coated and Paved

Invert: Fiber bonded full bituminous coated and paved conduits shall comply with all the requirements of 713.5.1 and shall be paved to conform with the requirements in AASHTO M 190, Type C.

713.6-FIBER BONDED FULL BITUMINOUS COATED AND FULL PAVED CORRUGATED STEEL SEWER PIPE:

Fiber bonded full bituminous coated and full paved steel sewer pipe shall comply with the requirements of 713.5.1, where applicable, and in addition thereto, the rivets shall be placed on the outside crests of the corrugations and the inside of the pipe shall be paved so that a smooth surface will be formed filling the corrugations of the pipe with a minimum thickness of $\frac{1}{8}$ in. (3 mm) over the crests of the corrugations. Smooth lined pipe over 30 inches (750 mm) in diameter shall be provided with lifting lugs for each section when manufactured.

713.7-CORRUGATED STAINLESS STEEL CULVERTS AND UNDERDRAINS:

Corrugated stainless steel culverts and underdrains shall comply with the requirements of zinc coated (galvanized) corrugated iron or steel culverts and underdrains, AASHTO M 36, with the following exceptions (Numbers refer to Subsections in AASHTO M 36):

1. SCOPE

- 1.1 This specification covers corrugated stainless steel culverts and underdrains.

3. IRON OR STEEL SHEETS:

- 3.1 The stainless steel sheets shall conform with the requirements of SAE Standard J-405B, Alloy Grade SAE 51409.

6. SHEET MANUFACTURER'S GUARANTEE:

- 6.1 The manufacturer of the sheets shall submit with the certified analysis a guarantee providing that all metal furnished conforms with the Specification requirements, shall bear a suitable identification brand or mark, and shall be replaced without cost to the purchaser when not in conformity with the specified analysis and sheet thickness; and the guarantee shall be so worded as to remain in effect as long as the manufacturer continues to furnish material.

7. RIVETS:

- 7.1 Rivets shall conform to the requirements of SAE Standard J-405B, Alloy Grade SAE 51430, or ASTM A 276, Type 430.

10. CORRUGATIONS:

Corrugations shall be annular, spiral or a combination of annular and spiral.

12. RIVETED SEAMS:

12.2 For pipe with 1 in. (25 mm) deep corrugations, ½ in. (12 m) diameter bolts and nuts conforming to the requirements of ASTM A 276. Type 430, may be used in lieu of rivets or spot welds on a one-for-one replacement ratio.

In Table 2, substitute sheet thickness as follows:

.048 (1.2 mm)	.105 (2.7 mm)
.060 (1.5 mm)	.135 (3.4 mm)
.075 (1.9 mm)	.164 (4.2 mm)

15. RESISTANCE SPOT WELDED SEAMS:

15.1.2 The welding shall be performed in such a manner that (1) the exterior surfaces of 90 percent or more of the spot welds on a length of pipe shall show no evidence of burning of the metal. Discoloration of the spot weld surfaces will not be cause for rejection.

15.3.5 In Table 3, substitute sheet thickness as follows:

Inches (mm) (Approx.)	Pounds (Mg)
.048 (1.2 mm)	3,100 (1.40)
.060 (1.5 mm)	4,100 (1.85)
.075 (1.9 mm)	5,200 (2.36)
.105 (2.7 mm)	7,000 (3.17)
.135 (3.4 mm)	8,500 (3.85)
.164 (4.2 mm)	10,000 (4.52)

19. TYPE III PIPE:

19.1 Culverts furnished under this type shall consist of stainless steel corrugated metal pipe to be used in underdrains. Unless otherwise specified the pipe shall be perforated.

21. COUPLING BANDS:

21.1 Revise third sentence as follows: The coupling bands shall be made of base metal conforming to SAE Specification J-405B, Alloy Grade 51409.

23. WORKMANSHIP:

23.1.10 Delete this Subsection.

24. REPAIR OR DAMAGED SPELTER COATING:

713.8

Delete this Subsection.

25. Add the following notation: This Section applies only with reference to those factors applicable to a stainless steel sheet.

713.8-STRUCTURAL PLATE FOR PIPE, PIPE ARCH, AND ARCHES:

These conduits, and bolts and nuts for connecting plates, shall conform to the requirements of AASHTO M 167.

713.9-FULL BITUMINOUS COATED STRUCTURAL PLATE PIPE, PIPE ARCH, AND ARCHES:

These conduits shall conform to the requirements of AASHTO M 167 and shall be coated with bituminous material conforming to the requirements of AASHTO M 190, Type A Coating.

713.10-STAINLESS STEEL STRUCTURAL PLATE PIPE:

Stainless steel structural plate pipe shall comply with the applicable requirements of structural plate pipe, AASHTO M 167, with the following exceptions (Numbers refer to Subsections in AASHTO M 167):

1. **SCOPE:**
This specification covers stainless steel structural plate pipe.
2. **BASE METAL:**
The stainless steel sheets shall conform with the requirements of SAE Standard J-405B, Alloy Grade SAE 51409.
4. **GAGE DETERMINATIONS AND TOLERANCE:**In Table II substitute as follows:

Gage	Sheet Thickness (Inches)	Tolerance Under
1	.276 (7 mm)	.012 (300 μm)
3	.245 (6.2 mm)	.012 (300 μm)
5	.215 (5.5 mm)	.012 (300 μm)
7	.184 (4.7 mm)	.012 (300 μm)
8	.164 (4.2 mm)	.012 (300 μm)
10	.135 (3.5 mm)	.012 (300 μm)
12	.105 (2.7 mm)	.012 (300 μm)

8. **CERTIFIED ANALYSIS AND GUARANTEE:**
The manufacturer of the sheets shall submit with the certified analysis

a guarantee providing that all metal furnished conforms with the specification requirements, shall bear a suitable identification brand or mark, and shall be replaced without cost to the purchaser when not in conformity with the specified analysis and sheet thickness; and the guarantee shall be so worded as to remain in effect as long as the manufacturer continues to furnish material.

10. BOLTS AND NUTS FOR CONNECTING PLATES:

Material for bolts and nuts shall conform to the chemical and mechanical requirements of ASTM A 276, Type 431, Condition T. Size and geometric configuration shall conform to the applicable requirements of ASTM A 325, Paragraph 5.

713.11-METALLIC COATED CORRUGATED STEEL UNDERDRAIN PIPE:

Metallic coated corrugated steel underdrain pipe shall conform with the requirements of AASHTO M 36 Type III.

713.12-BITUMINOUS COATED CORRUGATED STEEL UNDERDRAIN PIPE:

This pipe shall conform to the requirements of AASHTO M 36, Type III, and shall be coated with bituminous material conforming to the requirements of AASHTO M 190, Type A coating, except that the minimum coating thickness, shall be 0.03 in. (750 μ m) Coupling bands shall be fully coated. The specified minimum diameter of perforations shall apply after coating.

713.13-BLANK

713.14-CORRUGATED ALUMINUM ALLOY PIPE AND PIPE ARCHES:

Corrugated aluminum alloy pipe and pipe arches shall conform to the requirements of AASHTO M 196, Type I and II. Helically corrugated aluminum alloy culvert pipe shall conform to the requirements of AASHTO M 211.

Certification from the manufacturer will be the basis of acceptance for band material and rivets used in the fabrication.

713.15-BITUMINOUS COATED CORRUGATED ALUMINUM ALLOY PIPE AND PIPE ARCHES:

Bituminous coated corrugated aluminum alloy pipe, pipe arches, coupling bands, elbows, and other special sections shall conform to the requirements of AASHTO M 190. Coating and invert paving shall be of the type specified.

713.16-CORRUGATED ALUMINUM ALLOY PIPE UNDERDRAIN:

Corrugated aluminum alloy pipe underdrain shall conform to the requirements of AASHTO M 196, Type III.

713.17-BITUMINOUS COATED CORRUGATED ALUMINUM ALLOY PIPE UNDERDRAIN:

This pipe shall conform to the requirements of AASHTO M 196, Type III, and shall be coated with bituminous material conforming to the requirements of AASHTO M 190, Type A coating, except the minimum coating thickness shall be 0.03 in. (750 μ m) Coupling bands shall be fully coated. The specified minimum diameter of perforations shall apply after coating.

713.18-ALUMINUM ALLOY STRUCTURAL PLATE FOR PIPE, PIPE ARCH, AND ARCHES:

These conduits and the bolts and nuts for connecting plates shall conform to the requirements of AASHTO M 219.

713.19-FULL BITUMINOUS COATED ALUMINUM ALLOY STRUCTURAL PLATE PIPE, PIPE ARCH, AND ARCHES:

These conduits shall conform to the requirements of AASHTO M 219 and shall be coated with bituminous material conforming to the requirements of AASHTO M 190, Type A coating.

713.20-END SECTIONS FOR CORRUGATED STEEL PIPE AND PIPE ARCHES:

End sections for corrugated iron or steel pipe and pipe arches shall be of the thickness recommended by the manufacturer, and they shall conform to the applicable requirements of AASHTO M 36 and the details shown on the Plans.

713.21-END SECTIONS FOR CORRUGATED ALUMINUM ALLOY PIPE AND PIPE ARCHES:

End sections for corrugated aluminum alloy pipe and pipe arches shall be of the thickness recommended by the manufacturer and they shall conform to the applicable requirements of AASHTO M 196 or M 211 and the details shown on the Plans.

713.22-BLANK

713.23-PRECOATED, METALLIC COATED STEEL PIPE AND UNDERDRAIN:

Precoated sheets shall have a Type B coating conforming with the requirements of AASHTO M 246. The minimum thickness shall be 10 mils (250 μ m) on the inside and 3 mils (75 μ m) on the outside of the pipe.

Precoated, metallic coated steel pipe and underdrain shall conform to the requirements of AASHTO M 245 with the following exceptions (numbers refer to subsections of AASHTO M 245).

- 19.1 Coupling bands, conforming to the requirements of AASHTO M 218, will not require organic coating.

- 22.1.1 Damaged areas of spelter coating shall be painted in this sequence:
1. Zinc rich primer conforming to Section 711.21.
 2. Red oxide lacquer primer.
 3. Lacquer.
- 22.1.2 Areas of damaged polymeric coating only shall be painted in this sequence after the areas are rubbed with commercially available acetic acid (such as vinegar) and dried:
1. Red oxide lacquer primer.
 2. Lacquer.

The primer and lacquer as specified above must be mutually compatible when applied and compatible with the polymeric coating. The red oxide primer and lacquer, which are commercially available, shall be allowed to completely dry between coats and before handling and backfilling. If the lacquer is applied from a spray can, a minimum of two coats is required. The first coat should provide a light covering, and the second coat should be applied heavily just to the point of running.

713.24-ALUMINUM COATED CORRUGATED STEEL PIPE AND PIPE ARCH:

These conduits shall conform to AASHTO M 36 requirements for aluminum coated or aluminum-zinc coated corrugated steel pipe and pipe arch.

SECTION 714 CONCRETE, CLAY, FIBER AND PLASTIC PIPE

714.1-NONREINFORCED CONCRETE PIPE:

This pipe shall conform to the requirements of AASHTO M 86 or ASTM C 14.

714.2-REINFORCED CONCRETE CULVERT, STORM DRAIN AND SEWER PIPE:

This pie shall conform to the requirements of AASHTO M 170 or ASTM C 76.

714.3-REINFORCED CONCRETE ARCH CULVERT, STORM DRAIN AND SEWER PIPE:

This pipe shall conform to the requirements of AASHTO M 206 or ASTM C 506.

714.4-REINFORCED CONCRETE ELLIPTICAL CULVERT, STORM DRAIN AND SEWER PIPE:

This pipe shall conform to the requirements of AASHTO M 207 or ASTM

714.5
C 507.

714.5-PERFORATED CONCRETE PIPE:

This pipe shall conform to the requirements of AASHTO M 175 or ASTM C 444.

714.6-POROUS CONCRETE PIPE:

This pipe shall conform to the requirements of AASHTO M 176.

714.7-CONCRETE DRAIN TILE:

This pipe shall conform to the requirements of AASHTO M 178 or ASTM C 412.

714.8-CLAY DRAIN TILE:

Drain Tile shall conform to the requirements of AASHTO M 179 or ASTM C 4.

714.9-VITRIFIED CLAY-LINED REINFORCED CONCRETE PIPE:

Designs for fully lined or half lined pipe of the specified strength classes shall be submitted for approval. The applicable requirements of AASHTO M 170 and AASHTO M 65 or ASTM C 479 shall govern. Liner or liner elements shall be clay of first quality, sound, thoroughly and perfectly burned, without warps, cracks, or other imperfections, and they shall be fully and smoothly glazed.

714.10-CLAY PIPE:

This pipe shall conform to the requirements of ASSHTO M 65 or ASTM C 700. Extra strength clay pipe may be substituted for standard strength.

714.11 AND 714.12-BLANK

**714.13-PERFORATED ASBESTOS CEMENT PIPE FOR
UNDERDRAINAGE:**

The pipe shall conform to the requirements of AASHTO M 189 or ASTM C 508.

714.14-BITUMINIZED FIBER PIPE FOR UNDERDRAINAGE:

This pipe shall conform to the requirements of ASTM D 1861 or ASTM D 1862.

**714.15-PERFORATED BITUMINIZED FIBER PIPE FOR
UNDERDRAINAGE:**

This pipe and fittings shall conform to the requirements of ASTM D 2311.

714.16-FIBERGLASS-REINFORCED (FRP) PIPE:

This pipe shall conform to ASTM D 2996 or ASTM D 2997. Fittings shall

be those recommended by the manufacturer.

714.17-REINFORCED PLASTIC MORTAR (RPMP) PIPE:

This pipe shall conform to ASTM D 3262. Fittings shall be those recommended by the manufacturer.

714.18-REINFORCED CONCRETE END SECTIONS:

Precast reinforced concrete end sections shall conform to the requirements of the cited Specifications for the conduit to the extent to which they apply and to the details shown on the Plans.

714.19-CORRUGATED POLYETHYLENE PIPE:

The pipe shall meet the requirements of AASHTO M 252 for nominal sizes of 3 to 10 inches (75 to 250 mm) and AASHTO M 294 for nominal sizes of 12 to 36 inches (300 to 900 mm).

714.20-PERFORATED PLASTIC SEMICIRCULAR PIPE:

Perforated plastic semicircular pipe shall be extruded or molded using a high density, flexible plastic.

The pipe shall have a smooth or corrugated top and a smooth semicircular bottom, averaging 4 $\frac{5}{8}$ inches (116 mm) in diameter, with perforations uniformly distributed along the top of the semicircular section. The perforations shall be not less than $\frac{1}{4}$ inch (6 mm) nor more than $\frac{3}{8}$ inch (10 mm) in diameter, and shall provide a minimum intake area of one square inch per linear foot (2100 sq. mm per m). Minimum material thickness shall be $\frac{1}{8}$ in. (3 mm). The top flange shall extend a minimum of $\frac{1}{2}$ in. (13 mm) beyond the top of the semi-circular section.

A one foot (300 mm) section of pipe shall deflect no more than 1 $\frac{1}{2}$ at an applied load of 900 lb. (38 mm), using the Parallel Plate Load Test of ASTM D 2412. Fifteen minutes after removal of the load, the pipe section shall have recovered not less than 50 percent of its deflection at 900 lb. (4 kN).

714.21-ACRYLONITRILE-BUTADIENE-STYRENE (ABS) PIPE:

This pipe and fittings shall conform to AASHTO M 264, ASTM D 2680 or ASTM D 2751.

714.22-POLYVINYL CHLORIDE (PVC) PIPE:

This pipe and fittings shall conform to the requirements of AASHTO M278 or ASTM D 3034.

714.23 - PRECAST REINFORCED CONCRETE BOX CULVERTS:

Precast reinforced concrete box culverts shall conform to the requirements of AASHTO M259 where depth of cover is 2 feet (600 mm) or more and AASHTO M273 where depth of cover is less than 2 feet (600 mm). Interstate live load design shall be provided for Interstate highway facilities: and HS20

715.1

live load design shall be provided for other locations.

SECTION 715 MISCELLANEOUS MATERIALS

715.1-CALCIUM CHLORIDE:

The material shall conform to the requirements of ASTM D 98.

715.2-SODIUM CHLORIDE:

The material shall conform to the requirements of ASTM D 632.

715.3 AND 715.4-BLANK

715.5-PACKAGED DRY, HYDRAULIC-CEMENT GROUT (NON-SHRINK):

The material shall conform to the requirements of ASTM C1107.

715.6-HYDRATED LIME:

The material shall conform to the requirements of ASTM C 6.

715.7-WATER FOR USE WITH HYDRAULIC CEMENT:

Water from sources other than treated public water systems shall conform to the requirements of MP 715.07.20.

715.8-WATERPROOFING FABRIC:

The material shall conform to the requirements of AASHTO M 117.

715.9-WARNING DEVICES:

715.9.1-General: Warning devices shall include, but not be limited to, signs, barricades, auxiliary barriers, channelizing devices, hazard warning lights, flares, and reflectors. Unless otherwise indicated such devices shall conform to the Standard, "Traffic Control for Street and Highway Construction and Maintenance Operations", published by the Division.

The Contractor shall exhibit evidence that the warning devices furnished meet the requirements detailed.

715.9.2-Signs: Sign blank material shall be either 0.50 in. (12 mm) thick interior grade plywood, 0.10 in. (2.5 mm) thick aluminum, or 16 gage (1.6 mm) galvanized steel (thickness or gages shown here are nominal).

Reflectorization shall be required and shall compare favorably with reflective type sheeting meeting the requirements prescribed.

All warning signs shall have an orange background with black legend.

715.9.2.1-Reflective Sheeting, Type I: The reflective sheeting shall

consist of optical lens elements incorporated within a transparent weatherproof film having a smooth, flat outer surface.

715.9.2.1.1-Reflective Intensity: The reflective sheeting shall have a minimum reflective intensity values of 0.2° and 0.5°, divergence, as shown in Table 715.9.2.1.1-I, expressed as candlepower per foot candle per square foot (candles per lux per square meter) of material.

TABLE 715.9.2.1.1-I
MINIMUM REFLECTIVE INTENSITY FOR
TYPE I SHEETING

Divergence Angle (E)	Incidence Angle (E)	Silver White No. 1	Yellow	Red	Orange	Green	Blue	Brown	Silver White No. 2
0.2	-4	70	50	14.5	25	9	4.0	1	80
0.2	+30	30	22	6	7	3.5	1.7	0.3	35
0.5	-4	30	25	7.5	13.5	4.5	2	0.5	41
0.5	+30	15	13	3	4	2.2	0.8	0.20	21

Wet Performance-After accelerated weathering as specified under 715.9.2.1.3 Durability, the reflective intensity values of the sheeting material, when subjected to the rainfall test, shall not be reduced by more than 10 percent of the dry measured reflective intensity values of the weathered sample.

Copy-Reflective sheeting for all sign copy including letters, numerals, symbols, borders, and route markers shall be Silver White No. 2 which has been carefully selected by the manufacturer for day and night appearance.

Color-Through instrumental color testing the diffuse day color of the reflective material shall conform to the requirements of Table 715.9.2.1.1-II and shall be determined in accordance with ASTM E 97. Geometric characteristics shall be confined to illumination incident within 10deg. of, and centered about, a direction of 45 deg from the perpendicular to the test surface. Viewing shall be within 15 deg. of, and centered about, the perpendicular to the test surface. Conditions of illumination and observation shall not be interchanged. The standards to be used for reference shall be theMUNSELL PAPERS designated in Table 715.9.2.1.1-II. The papers shall be recently calibrated on a spectrophotometer.

TABLE 715.9.2.1.1-II

715.9.2.1.2-Adhesive: The reflective sheeting shall include a precoated pressure sensitive adhesive backing (Class 1) or a tack-free heat activated adhesive backing (Class 2) either of which may be applied without necessity of additional adhesive coats on either the reflective sheeting or application surface.

The protective liner attached to the adhesive shall be removed by peeling, without soaking in water or other solvents, without breaking, tearing or removing any adhesive from the backing. The protective liner shall be easily removed following accelerated storage for four hours at 160° F (71°C) under a weight of 2.5 psi (17 kPa).

The adhesive backing of the reflective sheeting shall produce a bond to support a 1: lb. (0.79 kg.) weight for five minutes, without the bond peeling for a distance of more than 2.0 in (50.8 mm.) when applied to a smooth aluminum surface.

715.9.2.1.3-Film:

General-The reflective sheeting shall have sufficient strength and flexibility so that it can be handled, processed, and applied according to the recommendations of the sheeting manufacturer without appreciable stretching,

tearing, or other damage. The sheeting shall permit cutting and color processing with compatible transparent and opaque process inks at temperatures of 60° F to 100° F (15 to 38°C) and relative humidity at 20 to 80 percent. The sheeting shall be heat resistant and permit force curing without staining of applied or unapplied sheeting at temperatures as recommended by the manufacturer.

Shrinkage-Following liner removal, the reflective sheeting shall not shrink more than 1/32 in. (0.79 mm.) in 10 minutes nor more than 1/8 (3.18 mm.) in 24 hours in any dimension per nine inch (22.9 cm.) square at 72° F (22°C) and 50 percent relative humidity.

Flexibility-The sheeting, applied according to the manufacturer's recommendations to a clean and etched .020 in. by 2 in. by 8 in. (0.51 mm. by 50.8 mm. by 203 mm.) aluminum panel, conditioned a minimum of 48 hours and tested at 72° F (23°C) and 50 percent relative humidity, shall be sufficiently flexible to show no cracking when bent around a 3/4 in. (19.1 mm.) mandrel.

Specular Gloss-The reflective sheeting shall have an 85 deg specular gloss of not less than 40 when tested in accordance with ASTM D 523.

Impact Resistance-The reflective sheeting material, applied according to the manufacturer's recommendations to a cleaned, etched aluminum panel 3.0 in. by 5 in. (76.2mm by 127mm) and conditioned for 24 hours at 72° F (23° C) and 50 percent RH shall show no cracking when the face of the panel is subjected to an impact of a 2.0 lb. (0.9 kg.) weight with a 5/8 in. (15.9mm) rounded tip dropped from a 10 in.-lb. (1.13newton meter) setting on a variable impact tester.

Durability-Processed and applied in accordance with recommended procedures, the reflective material shall be weather resistant and following cleaning, shall show no appreciable discoloration, cracking, blistering or dimensional change and shall not have less than 50 percent of the specified minimum reflective intensity values listed in Table 715.9.2.1.1-I when subjected too accelerated weathering for 1,500 hours in accordance with ASTM G 23, Type E or EH Weatherometer and when subjected to outdoor weather conditions for a period of seven (7) years.

715.9.2.1.4-General Characteristics and Packaging: The reflective sheeting as supplied shall be of good appearance, free from ragged edges, cracks, and extraneous materials, and shall be furnished in both rolls and sheets. When reflective sheeting is furnished in continuous rolls, the average number of splices shall not be more than three per 50 yd of material with a maximum of four splices per 50 yd length and splices shall be suitable for continuous application as supplied.

Rolls shall be packed snugly in corrugated fiberboard boxes in such a manner that no damage or defacement may occur to the reflective sheeting during shipment or storage.

Cut sheets shall be packaged flat between pressed composition board or corrugated pads of the same dimension to prevent damage or defacement

715.9.2.2

during shipment or storage.

Stored under normal conditions, the reflective sheeting shall be suitable for use for a period of at least one year.

715.9.2.2-Nonreflective Sheeting: The material shall consist of a flexible, pigmented plastic film, completely precoated with a pressure sensitive (Type I) or tack-free heat activated (Type II) adhesive. The adhesive shall be protected by a treated paper liner which shall be removable without soaking in water or other solvents.

715.9.2.2.1-Film: The material shall be sufficiently flexible to permit application over, and conform to, moderately contoured surfaces.

The unapplied or applied film, or both, shall be readily processed and shall insure adequate adhesion with process inks recommended by the manufacturer.

The film shall have an initial 60° gloss value of 35 (minimum) when tested in accordance with ASTM D 523, measuring at least three portions of the film to obtain uniformity.

The thickness of the plastic film with adhesive shall be a minimum of 0.003 in. (76 µm) and a maximum of 0.0045 inches (114 µm).

The material shall show not more than 1/64 in. (400 µm) shrinkage in any direction from the edge of the panel after being subjected to a temperature of 150° F (65° C) for 48 hours.

The material shall be heat resistant enough to retain adhesion after one week at 150° F (65° C).

715.9.2.2.2-Adhesive: When applied in accordance with the recommendations of the film manufacturer, the precoated adhesive shall form a durable bond to smooth, clean, corrosion-resistant and weather resistant surfaces, shall be of uniform thickness, shall be noncorrosive to applied surfaces and shall have no staining effect on the film.

The adhesive shall have proper bond, not to allow removal from the panel in one piece without the aid of a mechanical tool.

715.9.2.2.3-General Characteristics and Packaging: The material shall withstand one year's shelf life when stored in a clean area free from exposure to excessive heat, moisture, and direct sunlight.

The plastic film shall be furnished in rolls, cut sheets, or characters as may be specified. The film, as supplied, shall be free from ragged edges, streaks, blisters, foreign matter or other surface imperfections which would make it unsuitable for the intended usage, and shall be readily cut with scissors, knife, blade, shears or other production methods.

Rolls, sheets, or letters shall be individually packaged in suitable containers and in such a manner that no damage or defacement may occur to the plastic film during transport to destination.

715.9.2.2.4-Colors: Nonreflective sheeting shall be supplied in colors; red,

white, black, and yellow. The red and yellow colors shall be within the tolerance established by the Federal Highway Administration for highway signs.

715.9.2.3-Reflective Sheeting, Type II: The reflective sheeting shall consist of optical lens elements incorporated within a transparent, weatherproof film having a smooth outer surface. The sheeting shall have a precoated adhesive backing protected by a removable liner.

Test procedures will be in accordance with AASHTO T 257.

715.9.2.3.1-Reflective Intensity: The reflective sheeting shall have minimum reflective intensity values at 0.2° and 0.5°, divergence, as shown in Table 715.9.2.3.1-I, expressed as candlepower per square foot (candelas per lux per square meter) of material.

TABLE 715.9.2.3.1-I

**MINIMUM REFLECTIVE INTENSITY VALUES FOR TYPE II
AND IV SHEETING**

Diver- gence Angle(E)	Inci- dence Angle(E)	Silver-White	Yellow	Red			Orange
0.2	-4	250	170	45	100	45	20
0.2	+30	150	100	25	60	25	11
0.5	-4	95	62	15	30	15	7.5
0.5	+30	65	45	10	25	10	5

Wet Performance-After accelerated weathering as specified under 715.9.2.3.3 Durability, the reflective intensity values of the sheeting material, when subjected to the rainfall test, shall not be reduced by more than 10 percent of the dry measured reflective intensity values of the weathered sample.

Color-Through instrumental color testing the diffuse day color of the reflective material shall conform to the requirements of Table 715.9.2.3.1-II and shall be determined in accordance with ASTM E 97. Geometric characteristics shall be confined to illumination incident within 10deg of, and centered about, a direction of 45 deg from the perpendicular to the test surface. Viewing shall be within 15 deg of, and centered about, the perpendicular to the test surface. Conditions of illumination and observation shall not be interchanged. The standards to be used for reference shall be theMUNSELL PAPERS designated in Table 715.9.2.3.1-II. The papers shall be recently calibrated on a spectrophotometer.

715.9.2.3.2-Adhesive: The reflective sheeting shall include a precoated pressure sensitive adhesive backing (Class 1) or a tack-free heat activated adhesive backing (Class 2) either of which may be applied without necessity

715.9.2.3

of additional adhesive coats on either the reflective sheeting or application surface.

The protective liner attached to the adhesive shall be removed by peeling, without soaking in water or other solvents, without breaking, tearing or removing any adhesive from the backing. The protective liner shall be easily removed following accelerated storage for four hours at 160° F (71°C) under a weight of 2.5 psi (17kPa).

The adhesive backing of the reflective sheeting shall produce a bond to support a 1 ¾ lb. (0.79 kg.) weight for five minutes, without the bond peeling for a distance of more than 2.0 in. (50.8 mm.) when applied to a smooth aluminum surface.

715.9.2.3.3-Film:

General-The reflective sheeting shall have sufficient strength and flexibility so that it can be handled, processed, and applied according to the recommendations of the sheeting manufacturer without appreciable stretching, tearing, or other damage. The sheeting shall permit cutting and color processing with compatible transparent and opaque process inks at temperatures of 60° F to 100° F (15 to 38°C) and relative humidity at 20 to 80 percent. The sheeting shall be heat resistant and permit force curing without staining of applied or unapplied sheeting at temperatures as recommended by the manufacturer. Color processing for Type II material shall be restricted to sheeting with heat activated adhesive backing unless otherwise recommended by the manufacturer.

Shrinkage-Following liner removal, the reflective sheeting shall not shrink more than 2/32 in. (0.79 mm.) in 10 minutes nor more than 1/8 in. (3.18 mm.) in 24 hr. in any dimensions per nine inch (22.9 cm.) square at 72° F (22°C) and 50 percent relative humidity.

Flexibility-The sheeting, with the liner removed and conditioned for 24 hours at 72° F (22°C) and 50 percent RH, shall be sufficiently flexible to show no cracking when slowly bent, in one second's time, around a 1/8 in. (3.2 mm.) mandrel with adhesive contacting the mandrel. For ease of testing, talcum

powder may be spread on adhesive to prevent sticking to the mandrel.

Specular Gloss-The reflective sheeting shall have an 85 deg specular gloss of not less than 50 when tested in accordance with ASTM D 523.

Impact Resistance-The reflective sheeting material, applied according to the manufacturer's recommendations to a cleaned, etched aluminum panel 3.0 in. by 5 in. (76.2 mm. by 127 mm.) and conditioned for 24 hours at 72° F (23°C) and 50 percent RH, shall show no cracking when the face of the panel is subjected to an impact of 2.0 lb. (0.9 kg.) weight with a $\frac{5}{8}$ in. (15.9 mm.) rounded tip dropped from a 10 in.-lb. (1.13 newton meter) setting on a variable impact tester.

Durability-Processed and applied in accordance with recommended procedures, the reflective material shall be weather resistant and following cleaning, shall show no appreciable discoloration, cracking, blistering, or dimensional change and shall not have less than 70 percent of the specified minimum reflective intensity values listed in Table 715.9.2.3.1-I when subjected to accelerated weathering for 2,200 hours in accordance with ASTM G23, Type E or EH Weatherometer and when subject to outdoor weather conditions for a period of seven (7) years.

715.9.2.3.4-General Characteristics and Packaging: The reflective sheeting as supplied shall be free from ragged edges, cracks, and extraneous materials and shall be furnished in both rolls and sheets. There shall be no more than four splices per 50 yd (45 m) length and splices shall be suitable for continuous application as supplied.

Rolls shall be packed in corrugated fiberboard boxes in such a manner that no damage or defacement may occur to the reflective sheeting during shipment or storage.

Cut sheets shall be packaged flat between pressed composition boards or corrugated pads of the same dimensions as the sheets and shall be so packed as to prevent damage or defacement during shipment or storage.

The reflective sheeting as supplied, stored under normal conditions shall be suitable for use for at least one year after purchase.

715.9.2.4-Reflex Reflectors: The reflectors shall consist of a clear and transparent plastic face, referred to as the lens, and an opaque plastic back fused to the lens under heat and pressure around the entire perimeter to form a unit permanently sealed against dust, weather, and water vapor. The lens shall consist of a smooth front surface free from projections or indentations other than those for identification or orientation of the reflectors. The rear surface shall have a prismatic configuration such that it will effect total internal reflection of light. The manufacturer's trademark shall be molded legibly into the face of the lens.

The specific brightness of each reflex reflector intended for use in cutout letters, symbols, and accessories shall be equal to or exceed the following minimum values with measurements made with reflectors spinning. Failure to meet the specific brightness minimum shall constitute failure of the reflector

715.9.2.5

being tested. Upon failure of more than two reflectors out of 50 tested, a resample of 100 reflectors shall be tested; failure of more than four of these shall be cause for the rejection of the lot.

Observation Angle Degrees	Entrance Angle Degrees	Specific Brightness Candlepower/Square Inch/Footcandle (Crystal)
1/10	0	14.0
1/10	20	5.6

For yellow reflectors the specific brightness minimum shall be 60 percent of the value shown for crystal.

For red reflectors the specific brightness minimum shall be 25 percent of the value shown for crystal.

For green reflectors the specific brightness minimum shall be 25 percent of the value shown for crystal.

Test procedure shall be in accordance with MP 107.07.21.

715.9.2.5-Enclosed Lens Reflective Sheeting, Type III: The reflective sheeting shall consist of optical lens elements incorporated within a transparent, weatherproof, flat outer surface which will provide an optical retroreflective system that will meet the requirements of this specification. The sheeting shall have a precoated adhesive backing protected by a removable liner. The reflective sheeting shall have a watermark between the top film layer and the lens elements which shall be visible to the naked eye when viewed from a distance of 5 feet (1.5 m) under normal indoor lighting conditions. The watermark shall be spaced no more than 6 inches (150 mm) apart throughout the sheeting surface. Test procedures will be in accordance with AASHTO T 257.

715.9.2.5.1-Reflective Intensity: The reflective sheeting shall have minimum reflective intensity values at 0.2° and 0.5° observation angles as shown in Table 715.9.2.5.1-I expressed as average candlepower per foot candle per square foot (candelas per lux per square meter) of material.

TABLE 715.9.2.5.1-I
MINIMUM REFLECTIVE INTENSITY FOR
TYPE III ENCLOSED LENS SHEETING

Observation Entrance

Diver- gence Angle(E)	Inci- dence Angle(E)	White	Yellow	Green
0.2	-4	140	70	30
0.2	+30	65	33	8
0.5	-4	48	30	7
0.5	+30	28	18	3.5

Wet Performance-The reflective intensity values, when subjected to the rainfall test shall not less than 90 percent of the dry values listed in the above table.

Color-Through instrumental color testing, the diffuse day color of the reflective material shall conform to the requirements of table 715.9.2.5.1-II and shall be determined in accordance with subsection ASTM E-97.

Table 715.9.2.5.1-II

**COLOR SPECIFICATIONS LIMITS AND REFERENCE
STANDARDS FOR TYPE III ENCLOSED LENS SHEETING**

Green	.135	.352	.185	.375	.155	.460	.107	.439	3.5	9	.65BG 2.84/8.45

715.9.2.5.2-Adhesive: The reflective sheeting shall have a pressure sensitive backing (Class I) or a tack-free heat activated adhesive backing (Class II) that shall be applied to approved sign surfaces without the necessity of additional adhesive coats on either the reflective sheeting or the application surface.

The protective liner shall be attached to the adhesive and shall be removable by peeling, without soaking in water or other solvents, without breaking or tearing or removing any adhesive from the backing. The protective liner shall be easily removed following accelerated storage for four hours at 160° F

715.9.2.5

(71°C) under a weight of 2.5 psi (17KPa).

The reflective sheeting shall be tightly adhered to approved application surfaces when applied according to manufacturer's instructions and shall show no discoloration, cracking, crazing, blistering, wrinkling or dimensional change. The sheeting, when applied to approved surfaces at 72° F (22° C) and conditioned for 24 hours at this temperature, shall form a durable bond that will remain effective in temperatures of -30° F to 100° F (-35 to 38° C). Sheeting applied to clean, etched aluminum panels 6" x 6" (panels 150 mm x 150 mm) and conditioned at 72° F (22° C) for 48 hours, shall be subjected to 180° pullback at 12" per minute (300 mm per minute). Minimum pull strength shall be 4.4 pounds per inch (78 grams per millimeter).

715.9.2.5.3-Film:

General-The reflective sheeting shall have sufficient strength and flexibility so that it can be handled, processed, and applied according to the recommendations of the sheeting manufacturer without appreciable stretching, tearing, or other damage. The sheeting shall permit cutting and color processing with compatible transparent and opaque process inks at temperatures of 60° F to 100° F (15 to 38°C) and relative humidity at 20 to 80 percent. The sheeting shall be heat resistant and permit force curing without staining of applied or unapplied sheeting at temperatures as recommended by the manufacturer.

Shrinkage-Following liner removal, the reflective sheeting shall not shrink more than 1/32 inch (0.79 mm.) in 10 minutes or more than 1/8 inch (3.18 mm.) in 24 hours in any dimension per nine-inch (22.9 cm.) square at 72° F (22°C) and 50 percent relative humidity.

Flexibility-The sheeting, applied according to the manufacturer's recommendations to a clean and etched .020 inch by 2 inch by 8 inch (0.51 mm. by 50.8 mm. by 203 mm.) aluminum panel, conditioned a minimum of 48 hours and tested at 72° F (22°C) and 50 percent relative humidity, shall be sufficiently flexible to show no cracking when bent around a 3/4 inch (19.1 mm.) mandrel.

Specular Gloss-The reflective sheeting shall have an 85 degree specular gloss not less than 80 when tested in accordance with ASTM D 523.

Impact Resistance-The reflective sheeting material, applied according to the manufacturer's recommendations to a cleaned, etched aluminum panel 3.0 inch by 5 inch (76.2 mm. by 127 mm.) and conditioned for 24 hours at 72° F (22°C) and 50 percent RH shall show no cracking when the face of the panel is subjected to an impact of a 2.0 pound (0.9 kg.) weight with a 5/8 inch (15.9 mm.) rounded tip dropped from a 10 inch/pound (1.13 newton meter) setting

on a variable impact tester.

Durability-Processed and applied in accordance with recommended procedures, the reflective material shall be weather resistant and following cleaning, shall show no appreciable discoloration, cracking, blistering or dimensional change and shall not have less than 50 percent of the specified minimum reflective intensity values listed in Table 715.9.2.3.1-I when subject to accelerated weathering for 2,000 hours in accordance with ASTM G23, Type E or EH Weatherometer and when subjected to outdoor weather conditions for a period of seven (7) years.

715.9.2.5.4-General Characteristics and Packaging: The reflective sheeting as supplied shall be of good appearance, free from ragged edges, cracks and extraneous materials, and shall be furnished in both rolls and sheets. When reflective sheeting is furnished in continuous rolls, the average number of splices shall not be more than three per 50 yards (45 meters) of material with a maximum of four splices per 50 yard (45 meters) length and splices shall be suitable for continuous application as supplied.

Rolls shall be packed snugly in corrugated fiberboard boxes in such a manner that no damage or defacement may occur to the reflective sheeting during shipment or storage.

Cut sheets shall be packaged flat between pressed composition board or corrugated pads of the same dimension to prevent damage or defacement during shipment or storage.

Stored under normal conditions, the reflective sheeting shall be suitable for use for a period of at least one year.

715.9.2.6-Reflective Flexible Sheetting, Type IV: The reflective sheeting shall consist of a retroreflective lens system having a smooth outer surface. The sheeting shall have a precoated adhesive backing protected by a removable liner.

715.9.2.6.1-Reflective Intensity: The reflective sheeting shall have a minimum reflective intensity values at 0.2° and 0.5°, divergence, as shown in Table 715.9.2.3.1-I, expressed as candlepower per square foot (candelas per lux per square meter) of material.

Color-Through instrumental color testing the diffuse day color of the reflective material shall conform to the requirements of Table 715.9.2.3.1-II and shall be determined in accordance with ASTM E 97. Geometric characteristics shall be confined to illumination incident within 10 degrees of, and centered about, a direction of 45 degrees from the perpendicular to the test surface. Viewing shall be within 15 degrees of and centered about, the perpendicular to the test surface. Conditions of illumination and observation shall not be interchanged. The standards to be used for reference shall be the MUNSELL PAPERS designated in Table 715.9.2.3.1-II. The papers shall be

715.9.2.6

recently calibrated on a spectrophotometer.

715.9.2.6.2-Adhesive: The reflective sheeting shall include a precoated pressure sensitive adhesive backing (Class I) which may be applied without necessity of additional adhesive coats on either the reflective sheeting or application surface.

The protective liner attached to the adhesive shall be removed by peeling without soaking in water or other solvents, without breaking, tearing or removing any adhesive from the backing. The protective liner shall be easily removed following accelerated storage for four hours at 160° F(71°C) under a weight of 2.5 psi (17kPa).

The adhesive backing of the reflective sheeting shall produce a bond to support a 1 ¾ lb. (0.79 kg.) weight for five minutes without the bond peeling for a distance of more than 2.0 in. (50.8 mm.) when applied to a smooth aluminum surface.

715.9.2.6.3-Film:

General-The reflective sheeting shall have sufficient strength and flexibility so that it can be handled, processed and applied according to the recommendations of the sheeting manufacturer without appreciable stretching, tearing or other damage.

Shrinkage-Following liner removal, the reflective sheeting shall not shrink more than 1/32 in. (0.79mm) in 10 minutes nor more than ⅛ in. (3.18 mm.) in 24 hours in any dimensions per nine-inch (22.9 cm.) square at 72° F (22°C) and 50 percent relative humidity.

Flexibility-The sheeting, with the liner removed and conditioned for 24 hours at 32° F (0°C) and 50 percent RH, shall be sufficiently flexible to show no cracking when slowly bent, in one second's time, around a 1½ in. (3.2 mm.) mandrel with adhesive contracting the mandrel. For ease of testing, talcum powder may be spread on adhesive to prevent sticking to the mandrel.

Specular Gloss-The reflective sheeting shall have an 85 deg specular gloss of not less than 50 when tested in accordance with ASTM D 523.

Impact Resistance-The reflective sheeting material, applied according to the manufacturer's recommendations to a cleaned, etched aluminum panel 3.0 in. by 5.0 in (76.2 mm. by 127.0 mm.) and conditioned for 24 hours at 32° F (0°C) and 50 percent RH, shall show no cracking when the face of the panel is subjected to an impact of 2.0 lb. (0.9 kg.) weight with a ⅝ in. (15.9 mm.) rounded tip dropped from a 10 in./lb. (1.13 newton meter) setting on a variable impact tester.

Durability-Processed and applied in accordance with recommended

procedures, the reflective material shall be weather resistant and following cleaning, shall show no appreciable discoloration, cracking, blistering or dimensional change, and shall not have less than 70 percent of the specified minimum reflective intensity values listed in Table 715.9.2.3.1-I when subjected to accelerated weathering for 2,200 hr. in accordance with ASTM G23, Type E or EH Weatherometer.

715.9.2.6.4-General Characteristics and Packaging: The reflective sheeting as supplied shall be free from ragged edges, cracks and extraneous materials and shall be furnished in both rolls and sheets. There shall be no more than four splices per 50 yd. (45 m) length and splices shall be suitable for continuous application as supplied.

Rolls shall be packed in corrugated fiberboard boxes in such a manner that no damage or defacement may occur to the reflective sheeting during shipment or storage.

Cut sheets shall be packaged flat between pressed composition boards or corrugated pads of the same dimensions as the sheets and shall be so packed as to prevent damage or defacement during shipment or storage.

The reflective sheeting as supplied, stored under normal conditions shall be suitable for use for at least one year after purchase.

715.9.2.7 - Reflective Fluorescent Orange Sheeting, Type V: The fluorescent orange wide angle prismatic retroreflective sheeting is specifically designed for use on rigid substrate work zone signs to provide high visual impact under nighttime and daytime driving conditions, including low visibility periods such as dawn, dusk, and overcast days. The sheeting shall consist of prismatic lenses formed in a transparent fluorescent orange synthetic resin, scaled, and backed with an aggressive pressure sensitive adhesive protected by a removable liner. The sheeting shall have a smooth surface and with a distinctive interlocking diamond seal pattern and orientation marks visible from the face.

715.9.2.7.1 - Reflective Intensity: The reflective sheeting shall have minimum reflective intensity values at 0.2° and 0.5°, divergence, as shown in Table 715.9.2.7.1-I, expressed as candelas per footcandle per square foot (per lux per square meter) of material.

panels shall be determined instrumentally in accordance with ASTM E 811 and calculated in the u' , v' coordinate system in accordance with ASTM E 308. Sheeting shall be measured at 0.330 observation and -4° entrance at 90° rotation. Color shall conform to the requirements of Table 715.9.2.7.1-III.

TABLE 715.9.2.7.1-III

Color Specification Limits ** (Nighttime)

Color	1		2		3		4	
	$\frac{u'}{v'}$	$\frac{u'}{v'}$	$\frac{u'}{v'}$	$\frac{u'}{v'}$	$\frac{u'}{v'}$	$\frac{u'}{v'}$	$\frac{u'}{v'}$	$\frac{u'}{v'}$
Orange	.416	.538	.414	.530	.414	.530	.466	.526
(new and weathered)								

715.9.2.7.2 - Resistance to Accelerated Weathering: The retroreflective surface of the sheeting shall be weather resistant and show no appreciable cracking, blistering, crazing, or dimensional change after one year's unprotected outdoor exposure in south Florida, south-facing and inclined 45 degrees from the vertical or after 1500 hours' exposure in a xenon arc weatherometer in accordance with ASTM G 26, Type B, Method A. Following exposure, panels shall be washed in a 5% HCL solution for 45 seconds, rinsed thoroughly with clean water, blotted with a soft, clean cloth and brought to equilibrium at standard conditions: After cleaning, the coefficient of retroreflections shall be not less than 100 when measured in 2, below, and the color is expected to conform to the requirements of Tables 715.9.2.7.1-11 and III for weathered sheeting. The sample shall:

1. Show no appreciable evidence of cracking, scaling, pitting, blistering, edge lifting or curling, or more than 1/32 inch (0.08cm) shrinkage or expansion.
2. Be measured only at angles of 0.2 degrees observation, -4° degrees entrance and 90 degrees rotation. Where more than one panel of a color is measured, the coefficient of retroreflection shall be the average of all determinations.

715.9.2.7.3 - Impact Resistance: The retroreflective sheeting applied according to the sheeting manufacturer's recommendations to a test panel of alloy 6061-T6, 0.040" (0.10cm) by 3" (7.6cm) by 51, (12.7cm) and conditioned for 24 hrs., shall show no cracking outside the impact area when the face of the panel is subjected to an impact of 100 inch-pound (11.3Nm), using a weight with a 5/8 in. (15.8cm) diameter rounded tip dropped from a height necessary to generate an impact of 100 inch-pounds, at test temperatures of both 32 degrees F (0 deg. C) and 72 degrees F (12 deg. C).

715.9.2.7.4 - Resistance to Heat: The retroreflective sheeting, applied to a test panel as in 715.9.2.7.3, above, and conditioned for 24 hours, shall be measured in accordance with 715.9.2.7.1, at 0.20 observation and -40° entrance angles at 900 rotation and exposed to 170 ± 5 degrees F (77 ± 3 degrees C) for

715.9.2.7

24 hours in an air circulating oven. After heat exposure, the sheeting shall retain a minimum of 70% of the original coefficient of retroreflection.

715.9.2.7.5 - Field Performance: Retroreflective sheeting processed and applied to sign blank materials in accordance with the sheeting manufacturer's recommendations, is expected to perform effectively for a minimum of 3 years. The retroreflective sheeting will be considered unsatisfactory if it has deteriorated due to natural causes to the extent that: (1) the sign is ineffective for its intended purpose when viewed from a moving vehicle under normal day and night driving conditions; or (2) the coefficient of retroreflection is less than 100 when measured at 0.2° observation and -4° entrance at 90° rotation. All measurements shall be made after sign cleaning according to the sheeting manufacturer's recommendations.

715.9.2.8 – Retroreflective Sheeting for Traffic Control: The retroreflective sheeting shall conform to the requirements of AASHTO M 268. Either of the following classification types may be used.

1. Type IV
2. Type V

The retroreflective sheeting color and size shall be as specified on the plans.

715.9.2.8.1 – Adhesive:

General – The retroreflective sheeting shall include a Class 1 adhesive backing.

Test Method – The test panels shall be according to AASHTO M 268. Retroreflective sheeting that is to be applied to guardrail surfaces shall require certification of test performed on panels cut from Corrugated Sheet Steels for Highway Guardrail, per AASHTO M 180. The panel size shall be per AASHTO M 268.

715.9.3-Channelizing Devices and Auxiliary Barriers: Traffic cone markers shall be constructed of rubber or other flexible material acceptable to the Engineer, shall have a height of 28 to 36 in. (700 to 900 mm) and a base of approximately 14 in. by 14 in. (350 by 350 mm), and shall be predominantly orange in color. If the cones are required to be in place during periods of darkness, they shall be reflectorized.

Barricades shall be fabricated in accordance with details shown on the plans and shall not be constructed with sufficient strength to stop any vehicle which collides with them, but shall be so constructed as to do a minimum amount of damage to a vehicle colliding with them.

Traffic control drums shall be flexible plastic and appear basically cylindrical viewed from any direction. Drums shall have a minimum profile width of 18 inches (450 mm) regardless of orientation. The drum shall be 36 inches (900 mm) in height and orange in color.

The markings on the drum shall be horizontal, circumferential, orange and white reflectorized stripes 6 inches (152.4 mm) minimum width fabricated from Type I or Type IV sheeting. There shall be two orange and two white stripes uniformly spaced on each drum.

The drum shall be designed to securely attach a Type A or C warning light to the top of the drum. The drum shall contain a removable base not to exceed 5 inches (127 mm) in height.

715.9.4-Blank

715.9.5-Warning Lights: Warning lights shall meet the requirements prescribed and shall be of three types, as follows:

- i. Type A - Low Intensity Flashing Warning Light
- ii. Type B - High Intensity Flashing Warning Light
- iii. Type C - Steady Burn Warning Light

Each warning light shall be permanently marked as to type, the manufacturer's name, and the model number. Photoelectric controls, if provided on Type A or Type C lights, shall keep the light operating whenever the ambient light falls below 215 Lux.

715.9.5.1-General Requirements: The lens shall be illuminated by means of an electric lamp behind the lens and shall be externally illuminated by retro-reflective elements built into the lens to enable it to be seen by retro-reflection of light from the headlights of oncoming automotive traffic.

715.9.5.1.2 - Battery Powered: When the unit is to be operated by batteries, the batteries must be entirely enclosed in a housing meeting 715.9.5.5 with capability of being secured by a locking device.

715.9.5.1.3 - A. C. Powered: When the unit is to be operated by a 120-volt, 60 Hz power supply, the unit shall be supplied with a separate ground wire and be protected with suitable fuses. At no time shall the effective intensity have a value greater than 500 candelas. The connections and equipment used shall be in accordance with the pertinent current standards of the Institute of Electrical and Electronic Engineers, the American Society of Testing Materials, and the National Board of Fire Underwriters.

715.9.5.2 - Flash Requirements:

715.9.5.2.1 - Flash Rate: The light from Type A and Type B shall have a flash rate of 65, plus or minus 10 pulsations per minute from -20 to 150° F (-29 to 66° C) exclusive of power source.

715.9.5.2.2 - On-Time:

715.9.5.3

- i. Definition - On-time is defined as the period of the flash where instantaneous intensity is equal to or greater than the effective intensity as specified in Section 715.9.5.3.1.
- ii. Type A - The light shall have an on-time of not less than 10 percent of the flash cycle.
- iii. Type B - The light shall have an on-time of not less than 8 percent of the flash cycle.
- iv. Maximum allowable on-time for either Type A or Type B lights shall be 50 percent.

715.9.5.3 - Optical Requirements:

715.9.5.3.1 - Effective Intensity:

- i. The light distribution shall have a minimum lateral width of ± 9 degrees and a minimum vertical height of ± 5 degrees from the optical axis of the system. Within these confines, minimum candela requirements, as specified in Sections ii, iii, and iv of this paragraph, shall be met.
- ii. For Type A, the effective intensity shall not drop below 4.0 candelas within the area specified in paragraph i, during the first 336 hours of continuous flashing.
- iii. For Type B, the effective intensity shall not drop below 35 candelas within the area specified in paragraph i, during the first 168 hours of continuous flashing.
- iv. For Type C, the beam luminous intensity shall not drop below 2.0 candelas within the area specified in paragraph i, during the first 168 hours of continuous burning.

715.9.5.3.2 - Retro-Reflective Performance: The specific intensity of the retro-reflector at an observation angle of 0.2 degrees and a light incidence angle of zero (0) degrees shall not be less than 1.67 candelas/lux.

715.9.5.3.3 - Testing Procedure:

- i. Warning lights furnished under this specification shall be tested in accordance with the latest revision of ATSA Test Procedure T-101 (American Traffic Services Association).
- ii. The effective intensity of Type A and Type B lights shall be calculated using the "Guide for Calculating the Effective Intensity of Flashing Signal Lights," as approved by the Illuminating Engineering Society.
- iii. The intensity of the Type C light shall be tested as set forth in S.A.E. Standard J575.
- iv. Reflex-reflection shall be tested in accordance with S.A.E. Standard

J594.

715.9.5.4 - Lens Requirements:

715.9.5.4.1 - Size of Lens: The lens shall not be less than 7 inches (175 mm) in diameter, including a retro-reflector ring of approximately ½ in. (13 mm) width around a minimum of 300° of the periphery.

715.9.5.4.2 - Number of Lens: Type A and Type C shall have either a bidirectional or unidirectional lens. Type B shall have an unidirectional lens.

715.9.5.4.3 - Lens Chromaticity: If the light uses an incandescent lamp, the chromaticity of the lens color shall be defined by the trilinear coordinates of the C.I.E. Standards (Commission International d'Eclairage). When tested with illuminants from 2856K to 2366K, the lens color shall fall within the area of the Chromaticity Diagram according to the 1931 C.I.E. Standard Observer defined by the following coordinates:

X	Y	Z
0.543	0.452	.005
0.548	0.452	.000
0.584	0.411	.005
0.589	0.411	.000

If the light uses other than an incandescent lamp, the light output shall be in the same range as the light obtained with the incandescent lamp and the specific lens.

715.9.5.4.4 - Lens Luminous Transmittance: The minimum relative luminous transmittance of the lens with illuminant at 2856K shall be 0.440.

715.9.5.4.5 - Lens Material: The lens shall be of one-piece construction. The lens material shall be plastic capable of producing a lens that can meet the chromaticity and luminous transmission requirements of this specification. The lens material shall meet the test requirements set forth in the most recent edition of S.A.E. Standard J 576 (Society of Automotive Engineers, Inc., "Lighting Equipment and Photometric Tests") except that the exposure time and conditions (S.A.E. Standard, Paragraph 3.4.3) for the purposes of this specification shall be one year.

715.9.5.5 - Head and Housing:

715.9.5.5.1 - Swivel Head: When swivel capabilities as described in this subsection are not incorporated in the device used to mount a Type A or Type C light to a barricade or a sign, the head shall be mounted on the housing in a manner permitting it to be swiveled through a minimum 90° arc in a horizontal

715.9.5.5

plane. When swiveling is to be accomplished by rotation of the head, construction shall be such that the head rotation will not damage the wiring.

715.9.5.5.2 - Housing:

- i. Definition - Housing is defined as the case containing the batteries and circuitry.
- ii. Material - The housing shall be constructed of No. 18 U.S. Standard Gauge (1.3 mm) Steel or any other material which by engineering judgment is considered capable of withstanding considerable abuse.

715.9.5.5.3 - Painting: The housing and the lens frame, if of corrodible metal, shall be properly cleaned, degreased and pretreated to promote adhesion. It shall be given one or more coats of enamel which, when dry, shall completely obscure the metal substrate. The enamel coating shall be of such quality that when the coated case is struck a light blow with a sharp tool, the paint shall not chip or crack and if scratched with a knife shall not powder.

715.9.5.5.4 - Weatherproofing: The case shall be so constructed and closed as to exclude moisture that would affect the specified operation of the light. The case shall have a weephole to allow the escape of moisture.

715.9.5.6 - Certification: Certified Test data shall be furnished by the manufacturer based on testing by a qualified independent testing laboratory. Whenever any changes are made in the lens, bulb or circuit the warning lights shall be retested for compliance.

715.9.5.7 - Summary Information:

	Type A Low Intensity	Type B High Intensity	Type C Steady Burn
Lens Directional Faces	1 or 2	1	1 or 2
Flash Rate Per Minute	55 to 75	55 to 75	N.A.
Minimum On-Time	10%	8%	N.A.
Minimum Effective Intensity *	4.00 Candelas	35 Candelas	
Minimum Beam Luminous Intensity *			2 Candelas
Hours of Required Operation *	Dusk to Dawn	24 Hrs./Day	Dusk to Dawn

* These values must be maintained within the areas specified in subsection 715.9.5.3.1, paragraph i.

715.10-PREFABRICATED DRAINAGE SYSTEMS:**715.10.1 - Prefabricated Pavement Edge Drain:**

715.10.1.1 - General: Prefabricated pavement edge drain shall be a flexible rectangular hollow mat consisting of a supporting polymeric drainage core encased in an engineering fabric envelope and having sufficient flexibility to withstand installation bending and handling without damage.

715.10.1.2 - Core: The drainage core shall be constructed from a polymeric material, have a minimum thickness of $\frac{3}{4}$ inch (19 mm) and a minimum compressive strength of 3,000 pounds per square foot (145 kPa) with a maximum deflection of 20 percent determined by ASTM D 1621, except the sample size may be increased to a maximum of 12 in. by 12 in. (300 mm by 300 mm) The edge drain shall permit inflow on both sides of the drain and produce a minimum flow rate of 10 gal/minute/ft (123 liters/minute/meter) of width as determined by ASTM D 4716. Flow rates shall be based on a hydraulic gradient of 0.1 and a confining pressure of 10 psi (69 kPa) using a closed-cell foam rubber layer on both sides. The height of the edge drain shall be as shown on the Plans.

715.10.1.3 - Fabric: The fabric shall be suitable for subsurface drainage applications and shall meet the requirements of 715.11 except the minimum tensile strength shall be 90 lbs. (400 N). The fabric shall be bonded to or stretched tightly over the core support contact points.

715.10.1.4 - Fittings: All fittings shall be in accordance with the manufacturer's published specifications.

715.10.1.5-Outlet Pipe: The outlet pipe shall be a smooth inner wall unperforated pipe meeting the requirements of 714.19 (AASHTO M252, Type S only) or [714.22](#)

715.10.1.6 - Acceptance: All components of the edge drain shall be approved before use. The Contractor shall furnish certified test data with the material supplied for each project. Tests for all required properties shall be performed in accordance with the procedures specified. Compliance of this data with the requirements specified will be the basis of acceptance.

715.11-ENGINEERING FABRIC:

715.11.1-General: Engineering fabric shall meet the applicable requirements of AASHTO M 288.

715.11.2-Acceptance: All engineering fabric shall be approved before use. When using a fabric not on the Division's approved list, the Contractor shall

715.11.3

furnish certified test data with each shipment of fabric. Compliance of this data with the requirements of the specific application will be the basis of acceptance.

The test results submitted shall be derived from testing samples representing the fabric contained in each shipment. Tests for all required properties shall be performed in accordance with the procedures specified. Each roll shipped shall be identified so as to show its relationship to the test data submitted.

715.11.3-Maintenance and Repairs: Any fabric damaged or displaced shall be replaced or repaired at the Contractor's expense. Any fabric, other than that used for silt fence, not covered within 14 days after installation shall be removed and replaced at no expense to the Division. Minor tears or ruptures in the fabric may be repaired by sewing or by placing another piece of fabric over the damaged area so that the overlap is at least 2 feet (600 mm) in each direction or as directed by the Engineer.

715.11.4—ENGINEERING FABRIC FOR SUBSURFACE DRAINAGE

Engineering fabric for subsurface drainage shall meet the applicable requirements of AASHTO M 288, Section 7, Class 2. Additionally, the permeability shall be a minimum of 0.2 sec^{-1} and the apparent opening size shall be no larger than No. 60 (250 μm) sieve.

715.11.5—ENGINEERING FABRIC FOR SEDIMENT CONTROL (SILT FENCE)

Engineering fabric for sediment control shall meet the applicable requirements of AASHTO M 288, Section 8.

715.11.6—ENGINEERING FABRIC FOR EROSION CONTROL:

Engineering fabric for erosion control shall meet the applicable requirements of AASHTO M 288, Section 7.

715.11.7—ENGINEERING FABRIC FOR PAVING:

Engineering fabric for paving shall meet the applicable requirements of AASHTO M 288, Section 9.

715.11.8—ENGINEERING FABRIC FOR SEPARATION:

Engineering fabric for separation shall meet the applicable requirements of AASHTO M 288, Section 7.

715.11.9—ENGINEERING FABRIC FOR STABILIZATION:

Engineering fabric for stabilization shall meet the applicable requirements of AASHTO M 288, Section 7.

715.12-CONCRETE FOR MISCELLANEOUS USES:

Concrete specified in this Section is intended for such uses as cast-in-place footers for right-of-way fence and footers for guardrail breakaway cable

terminals and special trailing end terminals. The concrete may be mixed with or without air entrainment at the option of the Contractor. Batching and mixing may be by hand, by portable mixer, or by a commercial plant. At the time of placement, the concrete shall be of a workable consistency which can be consolidated satisfactorily by spading or vibrating. Indications of initial set in the concrete to such an extent as to adversely affect the workability of the concrete during placement shall be cause for rejection. The concrete shall be in accordance with one of the following:

- i. Concrete produced for other construction items under an approved mix design.
- ii. Concrete produced from premixed ingredients sold commercially in acceptable sacks, such as "Sacrete", or "Quickrete", "Handicrete or approved equal. Premixed commercial preparations shall be mixed in accordance with the manufacturer's instructions.
- iii. Concrete produced from separate components proportioned by volume in the ratio of one part portland cement to two parts sand to three parts coarse aggregate. Sand and coarse aggregate shall be visually inspected for deleterious substances, and such matter shall be removed prior to mixing.

715.13-PREFORMED FABRIC PADS:

Material shall conform to the requirements of the AASHTO Standard Specifications for Highway Bridges, Division II, Section 18.4.10.1.

A certified copy of test reports showing compliance with the above requirements shall be furnished the Division's Shop Inspector, or to other representatives of the Division as may be designated, for each shipment.

715.14-ELASTOMERIC BEARING PADS:

Bearing pads shall meet the requirements of the AASHTO Standard Specifications for Highway Bridges

715.15-ELASTOMERIC BEARING PADS FOR BRIDGE RAILING POSTS:

Elastomeric bearing pads for bridge railing posts shall have a thickness of $\frac{1}{8}$ inch (3 mm) unless modified by the project plans.

The pads shall have a minimum tensile strength of 1,000 psi (7 MPa) when tested in accordance with ASTM D 412. The pads shall have a durometer hardness of 55 to 75 when tested in accordance with D2240.

715.16-CLAY OR SHALE BRICK:

Brick shall conform to the requirements of one of the following Specifications:

Sewer Brick	AASHTO M 91, Grade SM or MM
Sewer Brick	ASTM C 32, Grade SM or MM
Building Brick	AASHTO M 114, Grade SW

715.17

Building BrickASTM C 62, Grade SW

715.17-CONCRETE BRICK:

Concrete brick shall conform to the requirements of ASTM C 55; the grade shall be as specified on the Plans.

715.18-CONCRETE MASONRY UNITS:

Hollow load-bearing concrete masonry units shall conform to the requirements of ASTM C 90. The type and grade shall be as shown on the Plans.

Solid precast segmental concrete masonry units for construction of catch basins and manholes shall conform to the requirements of ASTM C 139.

715.19-PRECAST CONCRETE UNITS FOR MANHOLES AND INLETS:

Precast concrete units for manholes shall conform to the requirements in AASHTO M 199. In addition, air entrainment in the concrete shall be seven percent plus or minus two percent.

Portland cement concrete for precast inlets shall be in accordance with the applicable portions of the "Materials", "Manufacture" and "Physical Requirements" sections of AASHTO M 199, with the additional statement regarding compression tests to be included in the "Physical Requirements" section: "If no design strength is specified for precast concrete inlets, the minimum 28-day compressive strength shall be considered to be the 3,200 psi (20 MPa) minimum cylinder strength."

Also, for precast inlets, air entrainment in the concrete shall be seven percent plus or minus two percent. Surface finish for precast inlets is not required, except, if resultant exposed surfaces have unsightly voids, flaking or other surface defects present, those imperfections shall be repaired in accordance with the requirements of [601.11.1](#) for Class 1, Ordinary Surface Finish.

715.20-PRECAST CONCRETE TRAFFIC DIVIDERS:

715.20.1-Materials:

715.20.1.1-Cement: The cement used shall conform to the requirements of [701.1](#) or [701.3](#). It shall, in addition, be manufactured to conform to the whiteness of Atlas or Medusa brands of white portland cement.

715.20.1.2-Water: Water shall conform to the requirements of [715.7](#).

715.20.1.3-Aggregates: Fine aggregate shall be white silica sand conforming to the requirements of [702.1.1](#), [702.1.2](#), [702.1.4](#) and [702.1.5](#). Coarse aggregate shall be marble, $\frac{3}{8}$ in. (9.5 mm) nominal top size. Fine and coarse aggregates shall meet the soundness requirements in [715.20.1.4](#).

715.20.1.4-Acceptance Tests: When tested in accordance with ASTM C 88 using sodium sulphate, the weighted average loss in five cycles shall not exceed five percent. If materials are blended to produce the aggregate, each component of the blend shall meet the soundness requirements specified above.

A sample of concrete made with the materials proposed for use in the item, combined in the proportions specified in 715.20.2, shall be submitted to the Engineer for inspection and approval of color. The sample size shall not be less than a two-inch (50 mm) cube.

Certified test reports from the manufacturer for all materials used in manufacturing the dividers shall be furnished.

715.20.2-Proportioning: Concrete shall be proportioned to meet the following requirements:

- i. The sand-aggregate ratio shall be in the range of 30 to 45 percent.
- ii. The maximum allowable slump shall be 1 in. (25 mm).
- iii. The maximum water content shall be five gallons per sack (0.44 liters per kg) of cement.
- iv. The minimum cement factor shall be eight sacks per cubic yard (446 kg per cubic meter) of concrete.
- v. The amount of entrained air in the plastic concrete shall be seven plus or minus two percent.

715.20.3-Placing and Curing: Concrete shall be placed in forms designed to conform to the lengths, shapes and other details of the traffic divider shown on the Plans. Curing shall be in accordance with the applicable requirements in 601.

715.21-BLANK

715.22-PRECAST CONCRETE MEDIAN BARRIERS (PERMANENT):

715.22.1-Description: Precast median barriers shall conform to the shape and dimensions shown on the Plans and shall meet the following requirements:

715.22.2-Materials: Materials shall meet the requirements specified in the following Subsections of Division 700:

MATERIAL	SUBSECTION
Cement	701.1
Fine Aggregate.....	702.1
Coarse Aggregate	703.1, 703.2 or 703.3
Air Entraining Admixture.....	707.1
Expansion Joint Filler Preformed.....	708.1
Joint Sealing Material.....	708.3
Reinforcing Steel	709.1 and 709.4

Sampling and testing of materials shall be in accordance with the minimum frequency stated in Table 2 of MP 711.03.30.

715.22.3-Proportioning: Concrete shall be in proportion to meet the following requirements:

- i. The minimum cement factor shall be seven sacks (6.58 cwt) per cubic yard (390 kg per cubic meter) of concrete.
- ii. The maximum water content shall be five gallons per sack (0.94 cwt) (0.44 liters per kg) of cement.
- iii. The amount of entrained air in the plastic concrete shall be seven plus or minus two percentage points.
- iv. The consistency shall be such as to allow proper placement, consolidation, and finishing.

715.22.4-Placing and Curing: Concrete shall be placed in forms designed to conform to the lengths, shapes and other details of the median barrier shown on the Plans. Curing shall be in accordance with the applicable requirements of 601.

715.22.5-Finishing: The surface of the barrier shall be smooth and free from air bubble pockets, depressions, and honeycombs.

When the barriers are removed from the forms, any surface imperfections present shall be repaired in accordance with the requirements of 601.11.1-Class I, Ordinary Surface Finish.

715.23-GABIONS:

715.23.1-Fabrication: Gabions shall be fabricated in such a manner that the sides, ends, lid and diaphragms can be assembled at the construction site into rectangular baskets of the specified sizes. Gabions shall be of single unit construction. The base, ends, and sides shall either be woven or welded into a single unit or one edge of these members connected to the base section of the gabion in such a manner that strength and flexibility at the point connection is at least equal to that of the mesh.

Where the length of the gabion exceeds its horizontal width, the gabion shall be equally divided by diaphragms, of the same mesh and gage as the body of the gabions, into cells whose lengths do not exceed the horizontal width. The gabion shall be furnished with the necessary diaphragms secured in proper position on the base section in such a manner that no additional tying at this juncture will be necessary.

All perimeter edges shall be securely selvedged, bound, or welded so that the joints formed have approximately the same strength as the body of the mesh.

715.23.2-Dimensions: Gabions shall be supplied, as specified, in various lengths and heights. However, all gabions furnished by a manufacturer shall be of uniform width and shall be shipped flat.

715.23.3-Tolerances: All gabion dimensions are subject to a tolerance limit of ± 3 percent of the manufacturer's stated sizes.

715.23.4-Twisted Wire Mesh Gabions:

715.23.4.1-Mesh Openings: Openings of the mesh shall not exceed $4\frac{1}{2}$ inches (114 mm) in the longest dimension.

715.23.4.2-Wire: All wire used in the fabrication and fastening shall be zinc coated in accordance with Class 3 of ASTM A641 when tested by ASTM A90. The adhesion of the coating to the wire shall be in accordance with ASTM A641.

The minimum wire sizes shall be as follows:

Tie Wire	0.087 ± 0.004 inches (2 mm \pm 100 μ m)
Body Wire	0.118 ± 0.004 inches (3 mm \pm 100 μ m)
Selvage Wire	0.154 ± 0.004 inches (3.91 mm \pm 100 μ m)

All the wire shall have a minimum tensile strength of 60,000 psi (400 MPa) when tested in accordance with ASTM A370.

The wire netting shall have a minimum of 10 percent elongation and a minimum 6,000 pound (26.7 kN) load bearing resistance. This testing shall be conducted as follows:

A section of mesh 6 feet (1.83 m) long, not less than 3 feet (914 mm) wide and including all selvage binding shall have the ends securely clamped for 3 feet (914 mm) along the width. When the width of the sample under test exceeds 3 feet (914 mm), the clamps will be placed in the middle portion of the width and the excess width will be allowed to fall free on each side of the clamped section. The sample shall then be subjected to sufficient tension to cause 10% elongation of the sample section between the clamps. After elongation and while clamped, the section will be subjected to a load applied to an area of one square foot (300 sq. mm) located approximately in the center of the sample section between the clamps, and in a direction perpendicular to the direction of the tension force. The sample shall withstand, without rupture of any

715.23.5

wire, or opening of any mesh fastening, a load of 6,000 pounds (26.7 kN). The ram head used in the test shall be circular with its edges beveled or rounded to prevent cutting of the wires.

715.23.5-Welded Wire Mesh Gabions:

715.23.5.1-Mesh Openings: Openings of the mesh shall not exceed 3 inches (75 mm) in the longest direction.

715.23.5.2-Wire: All wire used in the fabrication and fastening shall be zinc coated in accordance to Class 3 of ASTM A641 when tested by ASTM D90. The adhesion of the coating to the wire shall be in accordance with ASTM A641

The minimum wire sizes shall be as follows:

Body Wire	0.118 ± 0.004 in. (3 mm± 100 µm)
Tie Wire	0.087 ± 0.004 in. (2 mm ± 100 µm)

The welded joints of the wire mesh shall conform to ASTM A185 except that the minimum weld shear strength shall be 600 lbs. (2.67 kN) All the wire shall have a minimum tensile strength of 60,000 psi (400 MPa) when tested in accordance with ASTM A370.

715.23.6-Alternate Fasteners: The use of rings in assembly may be permitted by the Engineer. The rings shall have at least the same tensile strength, zinc coating, and size as the body wire.

715.24-MATTING FOR EROSION CONTROL:

715.24.1-General: Matting for erosion control shall be commercially designed and manufactured especially for the prevention of soil erosion.

The matting used shall be recommended by the technical representative for a manufacturer and approved by the Engineer after an evaluation of the site conditions has been made. The manufacturer shall provide installation instructions and attest that the proposed matting is well suited to the particular site to be protected.

The matting shall be stabilized or manufactured in such a way that the physical integrity of the product is maintained throughout the intended life expectancy. The matting shall not effect the germination of seed nor inhibit plant growth. Temporary matting shall gradually deteriorate with not adverse environmental effects.

715.24.2-Acceptance: Acceptance shall be based on the manufacturer's written certification that the erosion control mat used is well suited to the particular site to be protected and on the Division's visual inspection of the

material.

715.24.3-Permanent Erosion Matting: The matting shall consist of a machine produced mat of ultraviolet stabilized polymeric or other suitable fibers resistant to degradation and having a uniform weave distribution throughout. The mat shall conform to the following:

	<u>ASTM</u>	
(1) Minimum Mat Thickness	D 1777	0.4 in. (11 mm)
(2) Minimum (Wide Width) Tensile Strength*	D 4632	541 lb/ft
(3) Maximum Elongation	D 4632	75%
(4) Minimum Porosity (Calculated) **		90%
(5) Resiliency ***	D 1777	80%
(6) Ultraviolet Stability	D 4355	80%

Type A Matting shall have the ability to prevent vegetation and soil loss at water velocities of 4-8 fps as certified by the manufacturer.

Type B Matting shall have the ability to prevent vegetation and soil loss at water velocities of 8-15 fps as certified by the manufacturer.

- * Weakest principle direction
- ** Porosity calculation based upon unit weight, thickness and specific gravity
- *** Percentage of original thickness retained after three cycles of a 100 psi (.75 Mpa) load for 60 seconds followed by 60 seconds without a load thickness measured 30 minutes after load is removed.

715.25-GROUND AGRICULTURAL LIMESTONE:

Ground agricultural limestone shall consist of high calcitic or dolomitic limestone containing not less than 85 percent of total calcium and magnesium carbonates, ground to such fineness that not less than 35 percent will pass through a No. 100 (150 µm) sieve and 100 percent through a No. 10 (2 mm) sieve.

715.26-FERTILIZERS:

Commercial fertilizers shall be supplied separately or in mixtures containing the specified percentages of total nitrogen, available phosphoric acid, and water

715.26.1

soluble potash. Fertilizer shall be furnished in standard containers with weight, name of plant nutrients and guaranteed percentages, clearly marked, all in accordance with governing State and Federal laws. Brands must be registered with the West Virginia State Department of Agriculture.

715.26.1-Fertilizer for Seeding: Fertilizer for seeding shall consist of any type with a 1-2-1 ratio providing the minimum nutrient equivalent specified. Urea formaldehyde fertilizer shall contain a minimum of 38 percent slowly available nitrogen.

Commercial fertilizer for seeding may be supplied in any of the following forms, subject to the approval of the Engineer.

- i. A dry, free flowing fertilizer that may be applied by ordinary agricultural spreaders.
- ii. A fertilizer which is water soluble or one which will permit complete suspension of insoluble particles in water, applicable to hydraulic methods of application.

715.26.2-Fertilizer for Landscape Planting: The fertilizer shall be a co-granulated magnesium ammonium phosphate and magnesium potassium phosphate, controlled release, inorganic fertilizer compound (coarse grade). It shall have a guaranteed minimum analysis of:

	Percent
Nitrogen	7
Maximum water soluble ammoniacal nitrogen	2
Minimum water insoluble ammoniacal nitrogen.....	5
Phosphoric acid (available P ₂ O ₅)	40
Potash(K ₂ O).....	6

715.27-MULCH MATERIAL:

715.27.1 - Mulch Material for Seeding:

715.27.1.1 - Straw Mulch: Straw mulch for seeding shall include baled wheat or oats straw, or baled grass hay. Alfalfa, clover and salt grass hay are not acceptable. Straw mulch shall be dry and reasonably free from weeds, sticks, or other foreign material.

Acceptance shall be based on the Division's visual inspection of the material.

715.27.1.2 - Wood Cellulose Mulch: Mulch for use with the hydraulic application of grass seed shall consist of wood cellulose fiber. It shall contain no growth or germination inhibiting factors and shall be dyed green. When the material is agitated in slurry tanks with fertilizers, grass seed, water and other approved additives, the fibers shall become uniformly suspended to form a homogeneous slurry. The hydraulically sprayed slurry shall form a blotterlike ground cover impregnated with grass seed. The ground cover shall permit the absorption of water and allow rainfall or mechanically applied water to

percolate to the underlying soil.

The wood cellulose fiber mulch shall conform to the following requirements:

Length of fibers	10 mm. maximum
Thickness of Fibers	1 mm. maximum
Net Dry Weight Content*	Minimum stated on bag
pH*	4.0 - 8.5
Water Holding Capability*	90% Minimum

* Test Procedure - MP 715.27.20

The mulch shall be delivered in packages not to exceed 100 lbs. (45 kg) The package shall bear the name of the manufacturer, the net weight and a supplemental statement of the net dry weight.

The material must be approved prior to being used. Acceptance will be based on sampling and testing by the Division for conformance to specifications.

715.27.1.3 - Chemical Mulch Binder: A chemical mulch binder shall consist of a polymer synthetic resin, polypectate, or other material which can readily be removed and will give similar adhesive properties as asphalt when sprayed on straw or other fiber mulches.

715.27.2-Mulch Materials for Landscape Plantings: Acceptable materials for mulching shall be shredded bark, buckwheat hulls, wood chips or other organic materials approved by the Engineer.

Certain inorganic materials such as calcined clay, crushed rock or coarse gravel will be acceptable when designated on the Plans.

715.28-SEED:

The varieties of grass and legume seeds to be furnished to the project shall bear a tag on each bag of each species showing the lot number, the seedman's name, the percent of purity, the percent of germination and the weed seed content, in accordance with governing State and Federal laws.

All seeds shall be free from noxious weed seeds as set forth in the West Virginia State seed law and in no event shall the total weed content of any lot of seed or seed mixture exceed one-half percent by weight. The minimum percent purity and germination for the various seeds shall be as shown in Table 715.28.

715.29

		Germination	
Seed	Purity Minumum %	Total Minumum (%)	Minumum Quick Sprouts (%)
Crownvetch	99	*70	35
Kentucky Bluegrass	85	75	
Kentucky 31 Fescue	98	85	
Marion Bluegrass	90	75	
Perennial Ryegrass	95	85	
Red Fescue	98	85	
White Dutch Clover	98	*85	55

Crownvetch seed shall be inoculated according to the supplier's recommendations. However, when seeding with the hydroseeder the inoculant shall be increased to five times the recommended rate.

If test results indicate noncompliance with the above germination or purity requirements, or both, additional seed may be added to give the equivalent germination or purity, or both.

The Division reserves the right to test, reject or approve all seed after delivery on the project.

715.29-INOCULATING BACTERIA:

This material shall be used to treat all leguminous seed and shall be a pure culture of nitrogen fixing bacteria selected for maximum vitality and ability to transform nitrogen from the air into soluble nitrates and deposit them in the soil. It shall not be more than one year old.

715.30 THROUGH 715.32-BLANK

715.33-VINES AND GROUND COVER PLANTS:

This material shall have a healthy, well-formed root system, free from disease. All transported stock is subject to inspection by the State Agriculture Department for insect or plant pests, and subject to rejection if found lacking in any of the above requirements. All plants shall be nursery grown, two years or older, and of the quality and size designated on the Plans, subject to approval both at the nursery and on the planting site. All vines and ground cover plants shall meet the requirements of U.S.A. Standard for Nursery Stock, AAN. The 1969 edition shall govern unless a more recent issue is in effect at the time of advertisement of bids.

For vines and ground cover plants, a listing by standard names in effect on any date is on file with the Division and is available on request.

715.34-SEEDLING PLANTS:

This material shall have a healthy, well formed root system, free from disease. All transported stock is subject to inspection by the State Agriculture Department for insect or plant pests, and subject to rejection if found lacking

in any of the above requirements.

All plants shall be nursery grown, two years or older, and of the quality and size designated on the Plans, subject to approval both at the nursery and on the planning site. All seedling plants shall meet the requirements of U.S.A. Standard for Nursery Stock, AAN. The 1969 edition shall govern unless a more recent issue is in effect at the time of advertisement of bids.

For seedling plants, a listing of standard names in effect on any date is on file with the Division and is available on request.

715.35-TREES AND SHRUBS:

Plants shall be healthy with well developed root systems and top growth for the species and shall be free of injury from disease, insects or other causes. All plants shall be true to type and name in accordance with "Standardized Plant Names" where applicable. Plants shall conform to the requirements of U.S.A. Standard for Nursery Stock, AAN. The 1969 edition shall govern unless a more recent issue is in effect at the time of advertisement of bids.

Collected plants shall be native or naturalized trees or shrubs growing in soils favorable for digging. The soil shall be of such character as to be readily retained on the roots of transplanted trees and shrubs.

The minimum root spread of bare-root collected plants shall be at least one third greater than that for nursery grown bare-root plants. Nursery grown stock, balled and burlapped for shipment, shall have ball sizes conforming to an AAN Standards. In the case of collected plants, ball sizes shall be at least 10 percent greater in diameter than those specified for nursery grown stock and shall be of sufficient depth to include the greater portion of the root system.

For ornamental flowering trees, deciduous and evergreen trees, and deciduous and evergreen shrubs, a listing by standard names in effect on any date is on file with the Division and is available on request.

Wherever balled and burlapped material is mentioned in these Specifications, the Contractor may with the approval of the Engineer, substitute container stock for balled and burlapped stock of small trees and shrubs. The container grown plants shall conform to the AAN Standards.

Plantable type pots can be used in lieu of burlapping balled plants; however, a firm ball must be placed in the pot, and the hole dug with the same care and to the same size as for balled and burlapped plants. Plants with balls which have been manufactured on bare-root dug material or bare-root material that has only recently been potted will be rejected. These improperly potted plants will not be considered equal to balled and burlapped or container grown plants.

715.36-ASPHALTUM BASE PAINT FOR TREE SURGERY:

Paint for tree wounds shall be antiseptic and waterproof, black in color and with an asphaltic base. It shall contain no coal-tar creosote, oils, kerosene, turpentine or other material harmful to the living tissue of trees.

715.37-MISCELLANEOUS ITEMS FOR LANDSCAPE PLANTINGS:

715.37.1-Tree Stakes: Stakes used for guying or supporting newly planted

715.37.2

trees shall be made from rough sawed oak, or other approved material, free from unsound or loose knots that impair its strength. The stakes shall be two inch (50 mm) by two inch (50 mm) square and of a length in proportion to the height of the tree. The following lengths for stakes shall be used as a guide:

Approximate Tree Height Feet (m)	Stake Length Feet (m)
3 to 6 (1 to 2)	5 (1.5)
6 to 9 (2 to 3)	6 (2.0)
9 to 14 (3 to 5)	7 (2.5)

Larger size trees shall be guyed or supported by stakes as shown on the Plans.

715.37.2-Wire: The wire used for guying and staking plants shall be galvanized steel wire, free from bends and kinks. Trees less than 3 inches (75 mm) in diameter shall be guyed with No. 14 gage (1.9 mm) wire, and trees 3 inches (75 mm) and larger shall be guyed with No. 12 gage (2.7 mm) wire.

715.37.3-Hose: The hose used for staking and guying plants shall be new 3/8 to 5/8 in. (10 to 16 mm) nominal I.D. rubber garden hose or equal. The walls of the hose shall be of sufficient thickness to prevent wire damage to the plans.

715.37.4-Twine: The material used for tying wrapped tree trunks shall be binder twine not less than two-ply strength.

715.37.5-Tree Wrap: The material shall be four-inch (100 mm) wide waterproof sisal paper manufactured especially for wrapping trunks of trees.

715.37.6-Anti-Desiccant: Anti-desiccant shall be an emulsion which provides a protective film over plant surfaces, permeable enough to permit transpiration. It shall be delivered in the manufacturer's containers and shall be mixed according to the manufacturer's directions.

715.38-REINFORCED PLASTIC OR REINFORCED CORROSION-RESISTANT RUBBER MANHOLE STEPS:

715.38.1-General: Steps shall be composed of a steel reinforcing bar encased in plastic or rubber, pressure-molded to the steel; steps shall have a minimum cross-sectional dimension of 1 in. (25 mm). Reinforcing shall be continuous through the entire length of the legs and tread. Steps shall have a depressed tread or a 1/2 inch (12 mm) minimum height cleat at tread ends, and a top surface configuration such that it will prevent or minimize slippage during ascent or descent.

715.38.2-Steel Reinforcing: Steel shall be a deformed reinforcing bar; either No. 3, Grade 60, or No. 4, Grade 40 or 60 (Metric No. 10, Grade 300 or

Grade 400); meeting the requirement of AASHTO M 31.

715.38.3-Plastic: Plastic shall be a grade of propylene copolymer which meets the requirements of ASTM D4101.

715.38.4-Corrosion-Resistant Rubber: The rubber compound shall meet the physical requirements of ASTM C443 except the durometer, Shore A, hardness shall be 70 plus or minus five.

715.38.5-Acceptance: Steps which have been evaluated by the Division and appear on the Division's list of approved sources will be accepted. If the Contractor proposes to use a step not previously approved, a complete step and certified test data conforming to the above stated requirements shall be submitted for evaluation.

715.39-ELASTOMERIC GASKET AND SEALING MATERIAL:

These Specifications cover those elastomeric materials intended for use as, but not restricted to, such noncritical applications as gaskets, sealing materials, miscellaneous drainage items, etc. The elastomeric material shall meet the following requirements:

Tensile Strength, minimum psi (MPa), ASTM D 412.....	1,200 (8.3)
Elongation at Break, minimum percent, ASTM D 412.....	350
Shore Durometer Hardness, ASTM D 2440	
Minimum	35
Maximum	65
Compression Set, max percent, ASTM D 395,	
Method B.....	25
Accelerated Aging, ASTM D 573 (96 hr. at 70EC):	
Decreased Tensile Strength, maximum percent.....	15
Decreased Elongation, maximum percent.....	20
Water Absorption by Weight, maximum percent, ASTM D 471.....	10

715.40-PAVEMENT MARKING MATERIAL:

This material includes all pavement marking material exclusive of White or Yellow Fast-Dry Traffic Zone Paint (Types II or IX).

Certification from the manufacturer that the material supplied meets the applicable requirements of these Specifications is required. The certification shall include the name and address of the manufacturer, the trademark or trade name, kind of material, reference to the Division's Standard Specification (Subsection Number), quantities, lot number and date of manufacture.

The supplier shall have equipment and qualified personnel to conduct all of the tests that are required by these specifications.

715.40.1-Blank

715.40.2-Preformed Traffic Markings: The markings described are

715.40.2

preformed, retroreflective pavement markings conforming in color, size and shape to the West Virginia Department of Transportation, Division of Highways' Standard Details Book, Vol. II, and to the metric edition of the Federal Highway Administration's Standard Alphabets for Highway Signs and Pavement Markings. Transverse markings shall adhere to both asphalt and concrete for a minimum of three (3) years when applied according to the manufacturer's recommendations and shall maintain a minimum reflectivity of 150 millicandelas during this period. Longitudinal lines shall adhere to both asphalt and concrete for a minimum of four (4) years when applied according to the manufacturer's recommendations and shall maintain a minimum reflectivity of 150 millicandelas during this period. All reflectivity measurements will be taken with a Mirolux 12 retroreflectometer. If the material fails either the adherence or the reflectivity requirements during the time period specified, the material shall be completely replaced on the roadway surface by the Manufacturer at no additional charge to the Division. Upon completion of the contract, the warranty shall be transferred to the Division of Highways.

The Contractor shall provide the Engineer with certification from the manufacturer that they have been adequately trained through the Division of Highway's approved training seminar to apply this material. This certification shall be good for only one (1) year. The Contractor shall be required to recertify each year. The material must perform successfully in the Division's field evaluation test. A list of approved Contractor's personnel and suppliers and their code numbers may be obtained by contacting:

West Virginia Division of Highways
Materials Control, Soil and Testing Division
312 Michigan Avenue
Charleston, West Virginia 25305

715.40.2.2-Individual Requirements: The following are the individual requirements for the Preformed Traffic Markings (Type V):

- i. Tensile Strength: The film shall have a minimum tensile strength of 40 psi (276 kPa) of cross section when tested according to ASTM D 638. A sample 6 x 1 x 0.06 in. (150 x 25 x 1.5 mm) shall be tested at a temperature between 70° F and 80° F (21° C and 26° C), using a jaw speed of 10 to 12 in per min.
- ii. Elongation: A sample 6 x 1 x 0.06 in. (250 to 300 mm) shall have a minimum elongation of 75 percent when tested according to ASTM D 638 using a jaw speed of 10 to 12 in. (250 to 300 mm) per min.
- iii. Skid Resistance: The surface of the retroreflective pliant polymer shall provide a minimum skid resistance value of 35 BPN when tested according to ASTM E 303.
- iv. Reflective Intensity: The white and yellow film shall have the following initial minimum reflective values at 0.2 degrees and 0.5 degrees observation angles and 86.0 degrees entrance angle measured in

accordance with the testing procedures of Federal Test Method Standard 370. The photometric quantity to be measured shall be specific luminance (SL)*. and shall be expressed as millicandelas per square foot per footcandle ($\text{mcd.ft}^{-2}.\text{fc}^{-1}$). The metric equivalent shall be expressed as millicandelas per square meter per lux. The test distance shall be 50 feet (15 m) and the sample size shall be 2.0 x 2.5 feet rectangle (0.61 x 0.76 m).

The angular aperture of both the photoreceptor and the light projector shall be 6 minutes of arc. The reference center shall be the geometric center of the sample, and the reference axis shall be taken perpendicular to the test sample.

	<i>White</i>		<i>Yellow</i>	
Observation Angle	0.2 degrees	0.5 degrees	0.2 degrees	0.5 degrees
SL ($\text{mcd.ft}^{-2}.\text{fc}^{-1}$)	550	380	410	250

* "The quantity SL treats the retroreflector as a surface source (rather than a point source) whose projected area is visible as an area at the observation position). The quantity SL relates to the way the effective retroreflective surface is focused on the retina of the human eye and to the visual effect produced. It is recommended for describing the performance of highway signs and striping, or large vehicular markings which are commonly viewed as discernible surface areas."

715.40.3 THROUGH 715.40.5 – Blank

715.40.6-Raised Marker:

715.40.6.1-Raised Markers (Type P-2): Type P-2 markers shall consist of an iron casting to which is attached a replaceable prismaticretroreflector for reflecting light from a single or opposite direction. Both ends of the casting shall be shaped to deflect a snowplow blade upward, thus preventing damage to the reflectors. The bottom of the casting shall incorporate two parallel keels and an accurately shaped web designed to fit into parallel slots cut into the road surface. Fastening to the road surface is to be accomplished by the use of an epoxy adhesive.

Reflectors shall consist of a base molded from a highstrength engineering polymer. The base shall contain one or two prismatic reflective lenses to reflect incident light from a single or opposite direction. The lenses shall be hermetically sealed and permanently bonded to the reflector base. The reflector shall be adhesively attached to the casting as recommended by the manufacturer. Thin untempered glass shall be bonded to the front surface of the prismatic retroreflective lens faces to provide an extremely hard and durable abrasion resistant surface. color shall be as specified on the plans.

Using a steel wool abrasion procedure, the specific intensity of each

715.40.6

crystal reflecting surface at 0.2° observation angle shall be less than the following when the incident light is parallel to the base of the reflector.

Horizontal Entrance Angle	Specific Intensity
0°	4.0
20°	1.6

For yellow reflectors, the specific intensity shall be 60% of the value for crystal. For red reflectors, the specific intensity shall be 25% of the value for crystal.

Type P-2 marker shall be a Stimsonite Model No. 101 or approved equal.

715.40.6.2-Raised Markers (Type R-4): Markers shall consist of an acrylic plastic shell filled with a tightly adherent potting compound. The shell shall contain one or two glass covered prismatic reflective faces as required to reflect incident light from a single or opposite direction. The base of the marker shall be substantially free from gloss and substances that may reduce its bond to adhesive. Thin untempered glass shall be bonded to the prismatic reflective faces to provide an extremely hard and durable abrasion resistant surface. The outer surface of the shell shall be smooth except for purposes of identification. Color shall be as specified on the plans.

The adhesive used for installing the markers shall be one that is recommended by the manufacturer. It shall be mixed and used only as recommended by the manufacturer. The adhesive shall be mechanically mixed and placed on any given job requiring 50 or more markers.

715.40.6.3-Raised Markers (Type C-4, C-6 and C-8): Materials in this marker shall have a smooth abrasion resistant surface to produce the properties required in the specification.

The marker dimensions shall be as shown on the plans.

The marker shall have the shape of the outer segment of a spheroid and any change in curvature shall be gradual. The bottom surface shall not be smooth and shall be free from gloss or glaze.

The top surface material thickness shall be not less than 0.004 inches (100 μm) and shall not spall, craze or peel. The water absorption shall not exceed three percent of the original dry weight. The compressive strength of the marker shall not be less than 4,000 psi (27.6 MPa).

The color of the marker shall be uniform over the entire top surface and shall be as specified on the plans. The marker shall be R for reflective or NR for nonreflective as specified on the plans. The marker shall be nonreflective unless otherwise specified. The reflective marker shall be reflective in both directions unless specified as monodirectional in which case it shall face oncoming traffic. The reflectivity shall be accomplished by use of approved reflective lens inserts.

715.40.6.4 - Temporary Raised Markers (Type TCZ): Temporary Raised Markers (Type TCZ) shall consist of a plastic shell to which is hermetically sealed two prismatic reflective lenses to reflect incident light.

The markers shall be in the shape of a shallow round-cornered square with a spherical dome for enhancing the daytime signal. The marker dimensions shall be approximately 4 inches (100 mm) square and 0.75 inch (19 mm) in height when measured at the centroid. Color shall be as specified on the plans.

The prismatic reflective lenses shall have a minimum reflective surface of 0.38 square inch (245 sq. mm) with the following minimum optical requirements:

OBSERVATION ANGLE (E)	ENTRANCE ANGLE (E)	SPECIFIC INTENSITY *
0.2	0	1.0
0.2	20	0.4

- * Specific intensity shall be the candlepower (candelas) of the returned light at the specified observation and entrance angles for each foot candle (lux) of illumination at the reflector on a plane perpendicular to the incident light.

The above values are for white reflectors. For yellow reflectors, the specific intensity shall be 60 percent of the value for white.

Markers shall be capable of supporting a load of 10,000 pounds.

Markers shall be installed with the use of primer and butyl pad as recommended by the manufacturer or with the use of a bituminous adhesive as recommended by the manufacturer.

715.40.7-Blank

715.41-TRAFFIC SAFETY DEVICES:

Traffic Safety Devices shall meet the requirements of the AASHTO Roadside Design Criteria and the National Cooperative Highway Research Program Report 350, Recommended Procedures for the Safety Performance Evaluation of Highway Appurtenances.

The Manufacturer of the Safety Device shall provide certified crash test data that indicates the product meets the requirements noted above.

The manufacturer shall submit to Traffic Engineering Division 8 copies of their design (installation) drawings for the specific device. This drawing will be reviewed, if approved, it will be stamped and one copy returned to the manufacturer. Multiple devices of the same design for the same project or purchase order will require one set of drawings, not one set for each device. In addition, one design and one installation manual shall be shipped with each safety device.

715.41.1

All safety devices shall be manufactured and fabricated using the same components as crash tested. Any changes in design or compound shall be requested in writing by the supplier. The Engineer's concurrence is required prior to any change.

715.41.1-Sand Barrel Impact Attenuating Device (Type V):

715.41.1.1-Description: The unit shall have cylindrical containers capable of holding various amounts of sand. The amount of sand capable of being held shall include at least 2, 4, 7, 14, or 21 cubic feet (0.056, 0.112, 0.196, 0.393 or 0.588 cubic meters).

715.41.1.2-Performance: The unit shall be constructed so as to shatter upon impact to permit dispersion of the sand mass contained within. The center of gravity of each module shall be at a height which will control the attitude of the vehicle. The manufacturer shall certify that the units shall not crack, split, or color fade within five years of installation.

715.41.2-Crash Cushion Terminal Impact Attenuating Device (Type VI):

715.41.2.1-Description: The unit shall consist of a cable anchored system using slotted standard depth guardrail with breakaway wooden posts.

715.41.2.2-Performance: The unit shall be capable of redirecting 1,800 to 4,500 pounds (815 to 1 900 kg) vehicles at speeds up to 60 mph. (100 km/hr) which impacts the side of the unit at angles up to 15 degrees for the 1,800 pound (815 kg) vehicle and 25 degrees for the 4,500 pound (1 900 kg) vehicle.

715.41.3-Truck Mounted Impact Attenuating Device (Type VII):

715.41.3.1-Description: The unit shall consist of a crushable cartridge, a backup and a backup support structure for attaching the backup to the shadow vehicle. The unit shall have a standard trailer lighting system, including brake lights, taillights, turn signals and ICC bar lights. The back of the unit shall have a device attached with alternative diagonal black and reflectorized yellow stripes, 6 inches (150 mm) wide, similar to an XS-15 marker and in accordance with Section 3C-2 of the latest edition of the Manual on Uniform Traffic Control Devices for Streets and Highways.

715.41.3.2-Performance: The unit when attached to a standard truck weighing between 10,000 lb. and 24,000 lb. (4 530 kg and 10 872 kg) GVW, shall be capable of yielding according to the requirements of National Cooperative Highway Research Program Report 350. During the tests the truck shall have the brake set, transmission in gear, and engine off.

715.41.4-Quad Guard Impact Attenuating Device (Type VIII):

715.41.4.1-Description: The unit shall consist of crushable cartridges surrounded by a framework of steel Quad-beam guardrail which can telescope rearward during head-on impacts. The Quad Guard System shall have a center monorail which will resist lateral movement during side angle impacts. The nose shall consist of a formed plastic nose wrap.

715.41.4.2-Performance: The unit shall be capable of redirecting 1,800 to 4,500 pounds (815 to 1 900 kg) vehicles which impact the side of the system at speeds up to 60 mph. (100 km/hr) at angles up to 20 degrees for both right way and wrong way impacts (angles measured from systems longitudinal centerline). The unit shall be constructed so that there is no solid debris which can create a hazard on the roadway after impact.

715.41.5-Acceptance: Acceptance shall be based upon review and approval of the certified crash test data by the Division. An approved list of Traffic Safety Devices shall be developed by the Contract Administration Division.

715.42-TRAFFIC SIGNAL MATERIALS AND EQUIPMENT:

715.42.1-Pre-timed Fixed Cycle Traffic Signal Controllers:

715.42.1.1-Definition of Terms: Following are definitions of terms used by the Division for pre-timed fixed cycle traffic signal controllers:

Cabinet: A dustproof and weatherproof enclosure for housing the controller and associated equipment.

Circuit Contact Cam Shaft: A device to operate the circuit contacts to provide the desired interval sequence.

Controller: A complete electrical mechanism for controlling the operation of traffic control signals, including the timer and all necessary auxiliary apparatus mounted in a cabinet.

Local Controller: A controller for operating traffic control signals at an intersection which may be isolated or included in an interconnected traffic control signal system.

Master Controller: An automatic device for supervising a system of controllers, maintaining definite time inter-relationship, selecting among alternate available modes of operation or accomplishing other supervisory functions.

Pedestrian Actuated Controller: An automatic controller in which part of the intervals or groups of intervals, particularly pedestrian WALK and clearance intervals, are initiated by actuation of a pedestrian detector.

Pre-timed Controller: A controller for the operation of traffic signals with predetermined:

- i. Fixed cycle length(s).
- ii. Fixed interval duration(s)
- iii. Interval sequence(s)

Synchronous Controller: An automatic controller operated by a synchronous motor which will keep in step with the frequency of the power supply circuit.

Emergency Feature: A mercury contact bus bar relay installed in a controller, which when energized from a manual switch, remote point, discontinues the normal signal operation and displays special signal indications for the movement of high speed fire apparatus, etc.

Field Terminals: Devices mounted on a panel board for connecting all wires entering the controller cabinet.

Flashing Feature: A mercury contact bus bar relay installed in a controller which, when energized from a manual switch, remote point or by automatic time switch, discontinues normal signal operation and causes the flashing of any predetermined combination of signal lights.

Interval: The part or parts of the signal cycle during which signal indications do not change.

Interval Sequence: The order of appearance of signal indications during successive intervals of a cycle.

Jack Mounted Relay: A relay which may be removed or replaced without the use of tools and without disturbing any wiring.

Manual Operation: The operation of a controller assembly by means of a hand-operated device(s); (i.e., push-button).

Offset: The number of seconds or percent of the cycle length that a defined time-reference point (normally the start of major street green) at a traffic signal occurs after the time-reference point of a master controller or of an adjacent traffic signal.

Offset Control Switch: A device which when operated stops the timing of the cycle length and intervals in order to manually adjust the offset.

Offset Dial: A calibrated dial on an automatic timer equipped with adjusting devices by means of which it is possible to set any desired offset of the beginning of the green traffic control signal indication.

Offset Interrupter: A device which will distribute over two or more cycles the time required for large offset changes.

Panel: A panel board within the controller cabinet upon which are mounted fuse receptacles, circuit breakers, contactors, terminals, relays, and electrically operated switches and other equipment, all suitable insulated.

Pedestrian Phase (Pedestrian Movement): A traffic phase or traffic movement allocated exclusively to pedestrian traffic.

Radio Interference Suppressor: A device inserted in the power line in the controller assembly (cabinet) than minimizes the radio interference transmitted back into the power supply line, which interference may be generated by the controller or other mechanisms in the cabinet.

Relay Jack: A set of clips, plugs or receptacles in a controller or cabinet by means of which a relay may be mounted or connected to the circuit.

Reset: An adjustment mechanism applied to an automatic controller providing for the setting up of the timing arrangement of the start of the green traffic control signal indication.

Automatic Reset: A reset by means of which the offset or beginning of the green is checked automatically and adjusted, if necessary, once each time cycle.

Double Automatic Reset: A reset by means of which it is possible to automatically select any one of two automatic resets.

Triple Automatic Reset: A reset by means of which it is possible to automatically select any one of three automatic resets.

Manual Reset: A reset by means of which it is possible to manually adjust the offset or beginning of the green.

Reset Interrupter: A device which will automatically distribute the time lag resulting from a particular resetting over a period of time varying from one to several cycle lengths.

Shutdown Feature: A mercury contact bus bar relay installed in a controller which, when energized from a manual switch, remote point or by an automatic time switch, discontinues normal traffic control signal operation and turns the signal indications off.

Shutdown Switch: A switch in a controller which may be operated by hand to discontinue the operation of traffic control signals.

Signal Circuit Contact: A device arranged to energize or de-energize signal light circuits during a specified interval.

Signal Indication: The illumination of a traffic signal lens, or equivalent device, or of a combination of several lenses or equivalent devices at the same time.

Split: A division of the cycle length allocated to each of the various phases (normally expressed in percent).

Time Cycle: The number of seconds required for one complete revolution of the timing dial or complete sequence of signal indications.

Time Cycle Indicator: An indicating device applied to an automatic timer for indicating the time cycle in seconds.

Timing Dial: A calibrated dial on an automatic timer equipped with adjusting devices by means of which it is possible to divide the time cycle into the required number of intervals and set up the offset and interlock.

Timer: An automatic timing unit in a controller, including all dials, dial transfer relays, switching and circuit contacts, motors, gears, camshaft, etc.

Time Switch: A device for the automatic selection of modes of operation of traffic signals in a manner prescribed by a predetermined time schedule.

Traffic Phase: Those right-of-way and clearance intervals in a cycle assigned to any independent movement(s) of traffic.

Yellow-Red Flash Terminals: Addition terminals installed in a traffic signal controller so wired that by an interchange of jumpers, flashing operation may be arranged to give either yellow or red on the main or cross streets.

715.42.1

715.42.1.2-General Design Requirements: The following are minimum design and operating requirements for all pre-timed, fixed cycle traffic signal controllers and associated equipment described in these specifications.

The signal time cycle shall be constant and accurate, regulated by the power line frequency. Neither cycle length variations nor interval timing variations shall occur if voltage of the power line varies between the limits of 10 percent above and 10 percent below 120 volts, 60 Hz AC standard service voltage. Similarly, neither cycle length variations nor interval timing variations shall occur if outside cabinet temperatures change to any value between -30° F (-34° C) and plus 122° F (50° C). Maximum inside cabinet temperature for above operation is plus 165° F (74° C).

It shall be possible to accurately set or adjust the cycle lengths between the limits of 30 and 130 seconds with accurate and definite settings within this range in five-second steps up to 100 seconds, and in ten-second steps above 100 seconds. This adjustment shall be accomplished by a change of marked gears requiring no more than the use of simple tools. Gear and gear shaft shall be designed to prevent slippage. Gear meshing pressure must be adjustable. The cycle length in operation shall automatically be indicated on a scale visible on the front of the dial unit.

All pre-timed controllers shall contain three timing dials and be capable of being interconnected into a three-dial, three-offset system and shall include all the necessary keys, contacts, rider arms, etc.

The signal color sequence period adjustments and offset adjustments shall be made on the same timing dial without the aid of any tools. The timing dial shall be calibrated for the signal color period in steps of one percent from 1 to 99 percent. The offset calibration shall be in reverse order of the signal color sequence period. Each offset key shall be clearly identifiable as to its function and distinguishable from the color period keys. All keys for a given function shall be identical and each key having a specialized function shall be appropriately colored or otherwise identifiable to provide a visual indication of such function.

Any changes in operation of traffic control signal lights caused by turning the signal lights off, or turning them on flashing operation, shall not interfere with the continued in-time operation of the timer motor presently operating in each controller. A transfer from such special operation back to normal automatic operation shall immediately establish the normal time cycle and subsequently the in-time relation. The dial transfer mechanism shall be so designed that not more than one dial may operate at any one time. Dial No. 1 shall operate in absence of call for dial No. 2 or dial No. 3 or when there is a conflict on dial calls.

Each controller shall be furnished with three service manuals complete with all necessary instructions and diagrams for the installation and maintenance of the equipment supplied. Each controller shall be supplied with three complete sets of wiring diagrams. These wiring diagrams shall identify the color code or wire tagging used in all connections.

715.42.1.2.1-Interval Sequence: The controller shall provide consecutive divisions of the time cycle termed "intervals," during which time the combination of signal indications do not change. Each controller shall be provided with 12 or 16 interval cams. The cams shall be programmed so that a minimum number of dial unit keys are required for the plan specified phasing. If phasing is not specified, the cam lobes are not to be broken out.

715.42.1.2.2-Interval Adjustment: The controller shall provide for the setting of each interval of the cycle by means of a positive setting on each calibrated dial. The setting shall at all times show a visual indication of the amount of time allocated to each interval, in units of percent of the cycle length. When the controller is operating within a specified voltage and temperature limits, the time duration of each interval shall be within plus or minus 500 milliseconds of the time indicated by the setting of that interval, and timing of successive intervals shall be without cumulative errors that would affect the accuracy of the cycle length.

Each dial unit shall be provided with a scale calibrated in steps of one percent of the cycle length or one second, and shall provide for the accurate setting of any interval within the range of adjustment from 2 percent to 90 percent of the cycle length or from one second to 99 seconds.

The minimum time for any interval is not required to be less than one second whenever that is greater than two percent of the cycle length, nor is the minimum time for any interval required to be less than two percent of the cycle length when that is greater than one second.

The timing controls shall be on the front of the controller unit, easily identifiable, and it shall not be necessary to remove or change wires or contacts or to use any tools in making interval adjustments.

The three controller dial units specified shall provide for separate programs of interval timing. The dial units shall be readily identifiable and a change of one dial shall not affect or alter the other two dials. Dial transfer shall be accomplished at the beginning of main-street green.

The cam-shaft dial synchronization key (commonly called the camswitch release key, interlock, drum release or release key) shall terminate the main-street green interval. No more than two cycle lengths shall be required to effect a dial transfer.

715.42.1.2.3-Mechanism: The controller components shall be of unitized design and readily interchangeable.

All mechanisms, motors, operating coils, bearings, contacts, relays, flashers and similar components shall be sufficiently large, rugged and accessible to insure reliability and minimum maintenance. All equipment shall be neatly and systematically arranged and mounted to allow thorough inspection while the controller is operating normally, and to permit easy removal of removable components without interfering with other portions of the controller. Components shall be securely fastened in place to prevent accidental contact with moving parts or electrical power and to permit the cabinet door to be

715.42.1

opened and closed without interference or damage to the controller and wiring. Component accessibility shall permit easy access for any needed lubrication.

A 30 ampere, mercury contact-type bus bar relay shall be provided for opening the bus bar circuit for signal shutdown, flashing operation or any other type of controller preemption.

All relays associated with the control system shall be of the electromechanical type and designed for heavy, continuous operation. Except for the mercury contactors, all relays shall be mounted on a plug-in base with plug-in mounting. Dial transfer relays shall be jack or plug mounted within the timer unit chassis.

Solid state circuitry shall not be used in the dial transfer, offset or split functions. Point to point wiring must be used on all circuitry. Copper or other track board circuitry is not permitted.

The controller dial motors shall be designed for synchronous self-starting operation on 120 volts, 60 Hz, single-phase alternating current. The motors shall have ample torque for all requirements of controller operation. Motor and reduction gearing shall be a completely enclosed unit containing a lifetime supply of lubricant. This unit shall not be an integral part of the timer but shall be arranged for easy removal. A maximum of one connector of the screw or bolt type shall be used to hold the timing dial firmly in position.

The complete dial unit assembly shall be mounted in a manner which allows it to slide or hinge out of the timer chassis for complete access for inspection and maintenance.

Each dial unit shall be furnished with an assembly of five gears (15 per controller). Gears for cycle lengths of 50, 60, 70, 80 and 90 seconds shall be provided per dial, unless otherwise specified.

Only one contact (movable) shall be provided per controller circuit. Line side power for these circuits shall be by direct mechanical connection.

All make and break contacts shall be of fine silver or a superior alternate material and shall be capable of breaking a current of 15 amperes of tungsten lamp at 120 volts, 60 Hz AC, one half million times without breaking physically or failing to conduct current to the tungsten load when operated 360 times an hour. All signal contacts shall be readily accessible and easily inspected. The movable contacts shall be designed to eliminate the possibility of accidental cross connection between adjacent contacts. The contact assembly shall be designed so that the contacts can be arranged or rearranged to cause any signal light circuit to be energized or de-energized during any one of the intervals. All contacts shall be easily replaceable by the use of simple tools.

The controller signal common and signal circuit bus shall have an ampacity of not less than 30 amperes.

The controller shall provide terminals, wiring, cams and contacts for 18 circuits complete.

Cam sequence switching shall be so designed that it shall not be possible to display a noticeable "dark out" interval at any time following any control function transfer, transfer to flash or any preempt transfer. In addition, the

closing or opening of signal load contacts shall be positive, without objectionable dark intervals, flickering of lights or conflicting signal indications.

Cam shaft advance shall be shaded pole motor or electromagnetic coil and return by gravity assisted spring. The cam rotor mechanism shall provide ample torque to break all bus contact loads, as long as the contacts remain in operational condition. Cam shaft advance impulse shall be actuated by the timer dial unit, or when specified in the Plans by manual actuation.

All relays, coils, solenoids and motor windings shall be sufficiently large to insure reliability and minimum maintenance.

715.42.1.2.4-Electrical Connectors: All electrical connections to and from the timer unit to the controller back panel shall be made through a 47 pin MS screw-type connector and wiring harness. Each wiring harness shall be at least 48 in. (1.2 meters) long or of the standard length specified by the manufacturer for that controller type. The harness shall have color-coded leads of labeled sleeves or labeled wires. The harness connections on the controller shall be such that the timer unit may be replaced with a similar unit, without the necessity of disconnecting and reconnecting individual wires therefrom.

Seven circuits in this connector shall be capable of handling No. 12AWG wire and a maximum of 30 amperes each. Connector pins for these circuits shall be rated at 41 amperes. All other connector circuits shall be rated at 15 amperes (No. 16 AWG) with connector pins rated at 22 amperes.

715.42.1.2.5-Controller Wiring Panel: A controller panel shall be installed on the back wall of the controller cabinet on which all relays, contactors, breaker receptacles, electrically operated switching devices and other auxiliary controller equipment, not an integral part of the timer unit assembly, shall be mounted. The panel shall be easily demountable in order that the entire control system can be removed, inspected and replaced as a unit. There shall be a minimum of 3 inches (75 mm) clearance between the bottom of the panel and the bottom of the cabinet.

All terminals, except the interconnect system terminals, shall be mounted on the controller panel. Interconnect terminals shall be mounted on the side of the controller cabinet, unless otherwise specified. All panel wiring shall be neat and firm. The back panel shall contain at least the following:

- i. Terminals with circuit breakers for power supply.
- ii. Terminals unfused for neutral side of power supply.
- iii. One terminal for each outgoing signal circuit and one or more terminals for the common conductors.
- iv. A neutral bus with a minimum of six terminals to accommodate No. 10 wire.
- v. Terminals for pedestrian or any other type actuation.
- vi. Terminals for manual control of color sequence.
- vii. Terminals for red and yellow flash circuits.

715.42.1

viii. Controller mode switch.

The controller mode switch shall provide for selection of timing dial and offset or system operation as a minimum. A manual sequence mode position shall be provided if manual operation is specified.

All outgoing circuit terminals shall be suitably identified and shall be of the same polarity as the line side of the power supply. The ground side of the power supply shall be grounded to the controller in an approved manner.

Power service breakers shall be provided to terminate the No. 8 AWG service conductor circuits on the controller back panel. Breaker No. 1 shall provide overcurrent protection for the controller circuits and No. 2 protection for the flasher and associated circuitry.

715.42.1.2.6-Flashing Operation: Means shall be provided for the substituting of flashing vehicular signal indications for the normal specified interval sequence. The flashing operation of the controller shall be as specified on the Plans.

Flashing of vehicular and pedestrian signal indications shall be obtained from one or more flashers, each of which is a self-contained device designed to plug into a socket mounted on the back panel of the cabinet.

Each controller shall be equipped with additional terminals which are so wired that, by an interchange of jumpers, flashing operation may be arranged to display either flashing yellow or flashing red on each of the vehicular signals.

Each controller shall be provided with a flash control switch for activating the flashing of vehicular signals. The controller shall be constructed so that the flashing operation can be obtained by operating the flash control switch even if the controller unit malfunctions or is removed from the cabinet. During flashing operation, the controller timer unit shall be de-energized.

The substitution of flashing vehicular signal indications for the normal specified interval sequence shall be obtainable by time switch as well as by the flash control switch.

The controller shall be so designed that an "open" in power service breaker No. 1 shall automatically switch the signal to flashing operation (see 715.42.1.2.5).

715.42.1.2.7-Manual Operation: All controllers shall be designed capable of manual signal sequencing. When manual operation is specified on the Plans it shall be accomplished with the addition of standard components.

715.42.1.2.8-Pedestrian Actuation: When called for on the Plans, non-concurrent, exclusive pedestrian actuated phases shall subtract the WALK interval time from the lead phase "green" interval and DON'T WALK time from the following phase "green" intervals.

Manual operation of interval timing shall provide the same interval sequence as when the controller is operating automatically. Manual interval timing shall be obtainable by means of weather-resisting manual push-button

mounted on a flexible weather proof extension cord. The transfer of manual to automatic operation, or vice versa, shall be accomplished by an automanual switch. It shall not be necessary, when switching from manual to automatic operation, or vice versa, to do so at any certain time or to make any time adjustments.

715.42.1.2.9-Signal Shutdown: Each controller shall be provided with a signal shutdown switch for turning off the signals at the intersection. This switch shall affect the power to the signals only and no other part of the controller.

715.42.1.2.10-Warranties and Guarantees: The Contractor or supplier is required to turn over to the Division any guarantee or warranties which are give by the manufacturer as a normal policy. The Contractor or supplier shall furnish the Division with three copes of complete drawings, diagrams and manufacturer's instructions for installing and maintaining the equipment and any assistance as required for timing and operation of the equipment. Any component called for by the circuit design which has special unique characteristics which would limit that component to certain manufacturers or suppliers shall be so indicated in the manufacturer's instructions.

The Contractor or supplier shall make available to the Division, at no cost, engineering data, diagrams, etc. on any later changes or improvements which would increase the performance of the equipment purchased.

The Division reserves the right to withhold any payments which may be due, should it be discovered that the equipment does not meet the Specifications.

715.42.1.3-Pre-Timed Fixed Cycle Traffic Signal Controller (Type FT-3):

The purpose of this section is to set forth specific functional specifications and design requirements for the pre-timed fixed cycle traffic signal controller (local).

The general design requirements in 715.42.1.2 shall apply, except when the specific requirements exceed those in that section.

715.42.1.3.1-Interconnection: Type FT-3 controllers shall be furnished capable of interconnection with a master controller and other local controllers in signal system. A fused, interconnect terminal panel shall be furnished for mounting on the controller cabinet side wall. As a minimum, functional terminals for offset No. 1, offset No. 2, offset No. 3, dial No. 2, dial No. 3 and flashing operation shall be provided.

715.42.1.3.2-Isolation: The FT-3 controller shall also be furnished capable of operating as an isolated controller, functionally programmed by time clocks, master controller or other command device.

715.42.1.4-Pre-Timed Cycle Traffic Signal Master Controller (Type FT-

715.42.1

3M): The purpose of this section is to set forth specific functional specifications and design requirements for a pre-timed fixed cycle master traffic signal controller (master).

The general design requirements in 715.42.1.2 shall apply, except when the specific requirements herein exceed those in that section.

715.42.1.4.1-System Supervision: Type FT-3M controllers shall be furnished capable of providing system supervision for local controllers (FT-3) or local coordinating units (LCU), or both. All equipment and apparatus necessary to provide this supervision shall be furnished in the controller.

The following supervisory functions shall be furnished in the controller as a minimum:

- i. Means for automatically establishing offset time relations for a system of interconnected FT-3 or LCU units.
- ii. An offset interrupter for decreasing the disruption to interval timing caused by large offset changes.
Offset power shall be routed through an interrupter that is independent of the controller. The interruption interval shall be power on-line for 21 seconds, power off 2 seconds (23 second cycle). The interrupter shall be on breaker circuit No. 2 (flasher circuit).
- iii. Manual switch for transfer of all system controllers to flashing operation.
- iv. Manual switch for selecting dial No. 1, dial No. 2 or dial No. 3 at all interconnected FT-3 or LCU units, or both.
- v. Manual switch for selecting offset No. 1, offset No. 2 or offset No. 3 at all interconnected FT-3 or LCU units, or both.
- vi. Manual switch for transfer to emergency feature operation at all system controllers.

Back panel mode switching shall be furnished to accomplish manual operations.

The following supervisory functions shall also be controllable by the use of time clocks or other command devices:

- i. Selection of offset mode.
- ii. Selection of timing dial unit.
- iii. Selection of system flashing operation.
- iv. Selection of system emergency feature operation.

715.42.2-Solid State Traffic Actuated Signal Controllers:

715.42.2.1-Definition of Terms:

Actuated: Identifies the type of signal control which responds to calling signals generated by action of vehicle or pedestrian.

Action: The operation of any type of detector.

Auxiliary Equipment: Separate devices used to add supplementary

features to a controller assembly.

Cabinet: An outdoor enclosure for housing the controller unit and associated equipment.

Call: (Vehicle or Pedestrian) The result of a detector actuation indicating the presence of a vehicle or pedestrian requesting right-of-way.

Chassis: The traffic signal controller and housing, complete with power supply, internal wiring, harness pin connector and module bays to accommodate the number and type of phase modules specified.

Check: An outgoing circuit that indicates the existence of unanswered call.

Clearance Interval: A specific interval of time which follows after the termination of right-of-way to vehicles or pedestrians.

Controller: A complete electrical mechanism, including timer for controlling the operation of traffic signals.

Coordination: The terms applied to the interrelation between two or more intersection controllers.

Cycle: The total time required to complete one sequence of signal operation around an intersection.

Detector: An electrical device which when actuated signifies the passing or presence of a vehicle or pedestrian desiring the right-of-way.

Digital Timing: Pertaining to a method of timing that operates by counting discrete units.

Dual Max: A controller feature which provides two possible maximum time settings for cycle or right-of-way interval total time before termination.

Extension Unit: The timing interval during the extensible portion which is resettable by each detector actuation. The green right-of-way of the phase may terminate on expiration of the unit extension time.

Extension Limit: The maximum time of the extensible portion for which actuations on any traffic phase may retain the right-of-way after actuation on an opposing traffic phase.

Fail Safe: A controller feature that prevents conflicting phase indications when power or equipment malfunctions occur.

Flasher: A complete electrical mechanism for flashing a traffic signal or beacon.

Force Off: A command that will force the termination of the right-of-way.

Full Actuated: An intersection signal controller with detector input capability in all phases.

Gap Reduction: A feature where the "unit extension" or allowed time spacing between successive vehicle actuations on the phase displaying the green in the extensible portion of the interval is reduced.

Hold: A command that retains the existing right-of-way.

Initial: (Green) Minimum or guaranteed green time allotted the timing phase before which termination can begin.

Interface: A relay or electronic device(s) which isolates and matches one portion of a system to another.

715.42.2

Interval: Any one of the several divisions of the time cycle during which signal indications do not change.

Interval Sequence: The order of appearance of signal indications during successive intervals of a time cycle.

Main Frame: A definitive single chassis unit within the controller cabinet that contains all signal timing and control logic. This does not include back panels, load switching devices, flashers, breakers, detectors and other peripheral equipment inside the controller cabinet.

Manual Control: A control to permit authorized personnel in the option of terminating an active phase and initiating the next sequence in the signalization cycle.

Maximum: A time limit applied to traffic actuated controls to terminate and recall the timing phase after a predetermined time.

Major Street: The roadway approach or approaches at an intersection normally carrying the major volume of vehicular traffic.

Memory: Holds as recall a momentary vehicle actuation in the phase timer until the proper signal sequence can be displayed to release the vehicle.

Minor Street: The roadway approach or approaches at an intersection normally carrying the minor volume of vehicular traffic.

Modular Design: A design concept such that functions are sectioned into plug-ins units which can be readily exchanged with similar units.

Monitor, Signal Conflict: A device used to continually check for the presence of conflicting signal indications and too provide an output **in response to conflict**.

Nonlocking Memory: A mode of actuated-controller-unit operation which does not require detector memory.

Overlap: A right-of-way indication that allows traffic movement when the right-of-way is being assigned to two or more traffic phases.

Panel: A panel within the controller cabinet upon which are mounted fuse receptacles, terminals, relays and electrically operated switches and other equipment, all suitably insulated.

Passage Period: The time allowed for a vehicle to travel at a selected speed from the detector to the nearest point of conflicting traffic.

Pedestrian-Actuated Controller: An automatic controller in which part of the intervals or groups of intervals, particularly pedestrian WALK and clearance intervals, are initiated by the actuation of a pedestrian detector.

Pedestrian Detector: A detector, usually of the push-button type installed near the roadway and capable of being operated by hand.

Pedestrian Phase: (Pedestrian Movement) A traffic phase allocated exclusively to pedestrian traffic.

Power Line Switch: A manual switch for discontinuing the operation of both traffic controller and traffic control signals.

Power Supply: As used, a fused regulated DC power source for operation of control equipment where necessary. It must be an integral part of the controller chassis.

Pre-emption: The transfer of the control of the signals from any phase or controller mode to a pre-emption timing unit to provide right-of-way for emergency vehicles or trains.

Presence: Term applied to the detection pulse produced by a passing vehicle to be used by the control for other than count purposes. True presence indicates that the pulse duration is equal to the actual time the vehicle remains in the detector field of influence.

Radio Interference Suppressor: A device inserted in the power line in the controller assembly (cabinet) that minimizes the radio interference transmitted back into the power supply line, which interference may be generated by the controller or other mechanisms in the cabinet.

Recall: A manual switch which will cause the automatic return of the right-of-way to a street, regardless of the absence of actuation on that street.

Rest: The interval portion of a phase when present timing requirements have been completed.

Semi-Actuated: A type of traffic actuated controller in which means are provided for traffic actuation on one or more, but not all, approaches to the intersection.

Sequence: The order in which signal intervals are displayed around an intersection when there are calls on all phases of an intersection.

Signal Indication: The illumination of a traffic signal lens or equivalent device, or of a combination of several lenses or equivalent devices, at the same time.

Skip Phase: A feature of actuated intersection control which omits the right-of-way signal indication for a phase or movement that does not have vehicle or pedestrian calls.

Solid State: Circuitry using semi-conductor devices exclusively in contrast to electronic (electron tubes) and electro/mechanical devices (relays, motors, etc.).

Split: The division of time within the signal cycle between adjacent phases in the sequence.

Stop Timing: Refers to the feature of a signal controller by which the application of an external signal or voltage will stop any one or all interval timers from timing further.

Terminate: Applies most frequently to the end of a timing interval. Termination of right-of-way begins in an active phase when a call is received from an inactive phase in a full-actuated control; right-of-way termination must always include adequate clearance intervals.

Time Cycle: The number of seconds required for one complete revolution of the timing dial or complete sequence of signal indications.

Traffic Adjusted: Term used in master supervisory systems where vehicle actuations and other data are fed to the master for effecting signalization changes at several intersections rather than at each intersection independently.

Uniform Manual: (MANUAL OR MUTCD) *Manual on Uniform Traffic Control Devices for Streets and Highways*, published by the Department of Transportation, Federal Highway Administration.

715.42.2

Vehicle: A mobile inanimate object which legally must use roadways and is subject to traffic control by signalization.

Volume: Numerical count of vehicle traversing a roadway and passing over a detector in the roadway.

Wiring Harness: The multi-terminal (M or F) connector and associated wiring through which all electrical connections into and out of the controller chassis are made. All wiring harnesses shall be at least 48 in. (1.2 meters) long.

Yield: A command which permits the transfer of the right-of-way.

The above list of definitions may not be complete for all terms used. Final interpretation of all terms is the responsibility of the Engineer (See West Virginia Standard Specifications, Sections 101). Where applicable and as approved by the Engineer, definitions as published by the National Electrical Manufacturer's Association, Traffic Control Systems Standards may be applicable.

715.42.2.2-General Design Requirements: The following are minimum design and operating requirements for all types of solid state traffic-actuated signal controllers and associated equipment described in these Specifications.

These controllers shall be phase-modular and completely programmed for the phase and interval sequence specified for that chassis type. Phase, interval sequence and phase sequence functions and associated circuitry shall be assembled on removal plug-in modules. A separate, independent phase module shall be provided for each phase. Controller timing shall be by digital timing, utilizing power line frequency as a base, and be constant and accurate. The length of any interval, portion, period or unit extension as determined by the interval timing setting or any other programmed controller function shall not change due to power supply voltage variations between the limits of 95 to 135 volts AC. The nominal voltage shall be 120 volts AC. The controller and all associated equipment shall be designed to operate from a 120 volt, 60 Hz, AC supply (plus or minus 3.0 Hz).

Specifically, the environmental and operating limits specified in the latest Traffic Control Systems Standards Publication by the National Electrical Manufacturer's Association, designated as NEMA, must be adhered to.

A regulated fused power supply shall be an integral part of the controller chassis and it shall provide the DC voltages required for the operation of all equipment when necessary. This power supply shall provide the internal and external voltages and power requirements for normal operation of the signal equipment.

A dust resistant metal enclosure, or main frame chassis, suitable protected against corrosion shall be provided to enclose all electrical parts of the controller. The control devices, indicator lights, fuse holders, switches, input/output connectors and other components required for the operation and adjustment of the controller shall be mounted on the front panel(s). All component parts and terminals shall be readily accessible when the controller modules are removed from the enclosure for adjustments, testing or service. Circuit board extender cards or cable may be employed to facilitate testing.

The controller shall be designed for placement on a shelf. Maximum main frame sizes shall be as designated by NEMA for each controller chassis type.

The front panel(s) of the controller shall be permanently marked to indicate the module positions, and to identify the fuses, indicator lamps, switches, controls, etc. so that the operation of the controller shall be readily apparent.

The main frame chassis shall be completely equipped and wired for a full complement of modules as required for that chassis type. No additional hardware or wiring shall be required whether or not the main frame is used with the maximum possible number of modules.

All modules shall be removable from the front of the controller and those of unlike function shall be mechanically keyed or electrically inter-locked to prevent insertion into the wrong opening causing controller unit malfunction.

Modules of the same type shall be interchangeable between chassis. All modules shall be provide with controls as necessary to meet the functional requirements. In addition, all control logic for interval and startup sequence, overlap functions, coordination and all other specified controller functions must be an integral part of the main frame chassis.

Each module and associated controller bay shall be identified as to phase or function. To facilitate interchangeability, a guide or track shall be provided for each module assembly in the controller chassis. All modules shall be mechanically secured in the controller so as to retain the assemblies in their proper position under conditions of shock and vibration.

Each grouping of controller components as printed circuit assembly shall have a mean time to failure of three years. Printed circuits shall be of epoxy glass with an extra heavy (two ounces or more) copper track or a superior alternate or as otherwise specified by NEMA standards. Circuit reference symbols for all component parts shall be clearly marked on the circuit boards.

All switching functions internal to the controller shall be accomplished through the use of solid state circuitry. No electrical-mechanical devices, such as camshafts, rotary, stepping or line switches shall be used for switching functions.

All controllers shall be equipped so that they may be coordinated with other controllers or supervised by a master system. This shall be possible by the simple addition of accessory equipment external to the controller.

715.42.2.2.1-Phase Sequence Unit: The phase sequence unit must be an integral part of the controller main frame and shall establish the order and operation of the Phase Timing in accordance with vehicle and pedestrian detector calls.

In the absence of recall or detector actuation, the right-of-way shall remain on the traffic phase upon which the last actuation occurred. The actuation of any detector during the extendible portion of a traffic phase having the right-of-way shall cause the retention of right-of-way by that traffic phase for one unit extension from the time of actuation. One unit extension interval of time shall be guaranteed for each vehicle actuation registered during the extendible period. Each actuation shall cancel the remainder of the previous unit extension

715.42.2

interval in effect and initiate a complete new unit extension interval, timed from the instant of actuation. The actuation of a detector on another phase shall cause the right-of-way to transfer to that phase if during the extendible portion of the timing phase there have been no actuations for more than one full unit extension interval of time.

An actuation during the clearance period for a traffic phase shall cause the right-of-way to return to that phase in the same manner. Also, when the right-of-way is transferred by operation of the extension limit, the terminated phase shall again receive the right-of-way in the above manner without further detector actuations.

The controller shall be equipped with provision for skipping any phase when there is no call for that particular phase. Exact phase sequence when there are calls on three or more traffic phases shall be as specified for each controller chassis type.

The term "Phase A" as used shall in all cases refer to the artery or mainline phase. It shall be the first phase in the sequence of phases. Other phases such as B, C etc. shall follow Phase A in alphabetical sequence with right-of-way assigned in accordance with the above, or specified sequence logic.

715.42.2.2.2-Interval Sequence Unit: The interval sequence unit must be an integral part of the main frame and shall determine the order and control of the various intervals of each phase. The rotation shall be Green, Yellow, All Red and Red for vehicle movements and Steady Walk, Flashing Don't Walk and Steady Don't Walk for pedestrian movements.

The transfer of the right-of-way from any traffic movement shall take place only after a proper clearance period.

The clearance period for each vehicular phase shall consist of a vehicle change (Yellow) and an All Red Clearance interval. Each shall be timed separately and the second clearance interval of any phase may be omitted by a simple timing adjustment.

The clearance period for a pedestrian movement shall be a Flashing Don't Walk.

715.42.2.2.3-Interval Settings and Adjustments: The controller shall provide a positive means of setting signal timing intervals. The settings for each interval shall be in seconds or divisions of a second and the controller shall provide a clear visual display of the length of each interval or period. The interval settings shall be color coded, easily identifiable and shall be made by means of dials or thumbwheels. Settings shall be provided for each phase interval and shall be mounted on the front of the associated main frame phase module. It shall not be necessary to use punched data cards, remove or change wires, pins or contacts, or to use tools of any kind in making interval adjustments. All dials shall be on the front of the controller and easily accessible.

The minimum green interval shall be equal to either initial and one unit extension, walk plus pedestrian clearance, or walk plus pedestrian clearance

plus one extension.

The timing of the extension limit shall commence with the first actuation or other registration of traffic demand for the right-of-way on any traffic phase not having the right-of-way, and should begin after the initial period has expired.

In the event the controller reverts to the start-up sequence, the signal operation shall be initiated in the Phase A green interval and at least one initial and one unit extension (or vehicle interval) period shall be timed while in that sequence. As part of the initialization routine, vehicle calls shall be placed on all phases.

All phases shall be provided with at least the following intervals and minimum range of interval settings:

i. Initial Interval	0 to 99 Seconds
ii. Vehicle Interval (Extension)	0 to 9 Seconds
iii. Yellow Interval	0 to 9 Seconds
iv. Maximum Extension	10 to 99 Seconds
v. All Red Clearance	0 to 9 Seconds

Time spans and actuation limits specified are minimum and may be expanded.

Each phase shall be provided with recall and memory control. Capability to initiate the maximum or single unit extension recall shall be provided for each phase. In addition, phase memory of vehicle actuations during any interval shall be provided. There shall also be a "Memory Off" control for each phase to delete the memory feature when it is not required.

The controller shall be provided with a vehicle call indicator light for each phase. The indicator light shall respond to each vehicle call on its phase. The indicator light shall go off at the end or the initial portion of the green interval and indicate each actuation momentarily during the extendible portion of the green interval. Sufficient monitoring lights must be provided on the controller to visually indicate what part of the controller's timing and what function will follow. The monitoring lights shall be an integral part of the controller and must be a standard rather than an optional feature.

The front panel of the modules shall be engraved, silk screened or otherwise permanently marked to indicate module type and identify indicator lamps, switches, controls, etc. so that the functions of the module are readily apparent.

715.42.2.2.4-Flashing Operation: For use during periods of low traffic volume or emergency conditions, a flasher unit shall be provided to flash all signal indications displayed during any specified yellow-red or all-red sequence.

Upon resumption of controller operation of the signal indications, Flashing Red indications must be followed by the Steady Red or Steady Green interval

715.42.2

of that sequence and Flashing Yellow must be followed by the Steady Green interval. This logic must be built into each controller main frame chassis.

The controller shall be designed such that a fuse failure (open) on the controller side of the power supply will automatically switch the signal to flashing operation.

715.42.2.2.5-Manual Control Feature: The controller shall be so designed that by wiring external to the controller, manual control of signal sequence timing may be assumed. The manual control function may be assumed with the application of the Stop Timing command. The operator may sequence the controller by applying input signals with a Manual Advance Switch.

715.42.2.2.6-Uninterrupted Timing: Normal traffic-actuated operation shall be resumed automatically after Manual, Flashing Preemption or any other special operation has been utilized.

715.42.2.2.7-Stop Timing: Means shall be provided so that on call, timing may be stopped on any one of all interval timers in the control system. This is provided for the purpose of adding extra intervals or auxiliary equipment, or both. Upon resumption of timing, the interrupted interval shall be timed in its entirety.

715.42.2.2.8-Auxiliary Equipment: The controller shall be so designed that all standard auxiliary equipment may be added without internal controller modifications. Railroad or fire station pre-emption equipment shall be constructed and wired so as to transfer control of the signals from either the controller or the flasher unit to the preemption timing unit. Installation of the pre-emption equipment shall not alter the internal wiring of the controller chassis normally furnished by the manufacturer. In addition, the controller shall be furnished capable, by the addition of standard accessories external to the controller, of the following functions:

- i. Actuated pedestrian timing associated with each phase.
- ii. Minor movements associated with each phase.
- iii. Overlaps as required.

715.42.2.2.9-Check Circuit: All controllers must be provided with a check circuit to indicate the presence or absence of an actuation on any of the phases which do not have the right-of-way so that a pedestrian interval timer may be added to any phase without additional equipment, other than the pedestrian timer.

715.42.2.2.10-Connectors and Wiring Harness: All electrical connections to and from the controller shall be made through MIL-C-26482 series pin connectors and wiring harness. Each wiring harness shall be at least 4 feet (1.2 m) long or of the standard length specified by the manufacturer for

that controller chassis type. The harness end opposite the connector shall have color-coded leads or labeled sleeves. The harness connections shall be mounted on the front of the controller unit in accordance with the following:

Connector A shall intermate with an MS3116()-22-55S.

Connector B shall intermate with an MS3116()-22-55P.

Connector C shall intermate with an MS3116()-24-61P.

The wiring harness, harness terminal functions and the MS connectors shall be identical for each connector type.

Terminals shall be provided for the signal light cable. One terminal for each signal circuit and one or more terminals for the common conductors are required. All field wiring shall be color coded and the terminals labeled.

The outgoing signal circuits shall be of the same polarity as the line side of the power supply and the common return shall be of the same polarity as the ground side of the power supply.

A double pole, low-voltage lighting arrester with mounting bracket shall be mounted on the back panel and wiring between the power supply and the fuse.

All terminals except the interconnect system shall be mounted on the controller panel. The interconnect terminals shall be mounted on the side of the controller cabinet unless otherwise specified.

715.42.2.2.11-Controller Terminal Functions Required: All controller functions shall be available at the MS connector terminals on the controller chassis. These functions shall be as specified in the latest NEMA standard-identification of input/output pin connector termination.

In addition, the controller shall be provided with all terminal functions necessary for plan phasing and to meet the specification requirements. All functions shall be standard controller features and shall be available at the external controller terminal points.

715.42.2.2.12-Per Phase Load Switching Devices: Solid-state, heavy-duty, jack mounted, per phase load switching units shall be used for opening and closing the signal light circuits. Each switching circuit shall have a minimum rating of 10 amperes for a tungsten-lamp or gas-tubing transformer load over a voltage range of 95 to 135 volts at 60 Hz. No more than one circuit shall be energized at any one time unless the combined load on the energized circuits does not exceed a 10 ampere load. This, power handling capability shall not be derated for operation over the operating ambient temperature range described in the NEMA standards.

Covers or cover plates on all switching devices shall be so designed as to be easily removed and replaced by means of set screws or similar replaceable securing devices.

All load switches shall intermate with a Cinch-Jones socket S-2412-SB, or the equivalent. Physical and electrical characteristics of the switches and load racks must conform to the latest NEMA standards.

Signal load switches for use with the controller, but for mounting external to the controller units specified, shall be used for switching signal light circuits.

715.42.2

715.42.2.2.13-Fail Safe: Insofar as possible, all phase and interval sequence logic internal to the controller shall be such that conflicting signal indications are not possible even during power failures or equipment malfunction. If "failsafe" signal monitoring devices are required external to the controller, it must be clearly stated in the manufacturer's instructions.

In the same manner, combinations of signal indications expressly prohibited in the Manual on Uniform Traffic Control Devices shall not be possible.

715.42.2.2.14-Warranties and Guarantees: The Contractor or supplier is required to turn over to the Division any guarantee or warranties which are given by the manufacturer as a normal policy. The Contractor or supplier shall furnish the Division with two copies of complete drawings, diagrams and manufacturer's instructions for installing and maintaining the equipment and any assistance as required for timing and operation of the equipment. Any component called for by the circuit design which has special or unique characteristics which would limit that component to certain manufacturers or suppliers shall be so indicated in the manufacturer's instructions.

The Contractor or supplier shall make available to the Division at no cost, engineering data, diagrams, etc. on any later changes or improvements which would increase the performance of the equipment purchased.

The Division reserves the right to withhold any payments which may be due, should it be discovered that the equipment does not meet the Specifications.

All components specified shall be amply derated with regard to heat dissipating capacity and rated voltage so that, with maximum ambient temperature and maximum applied voltage, material shortening of life or shift in values shall not occur.

715.42.2.3 THROUGH 715.42.2.4 -Blank

715.42.2.5-Solid State Traffic-Actuated Signal Controller (Type C) (Two Through Eight-Phase NEMA-Microprocessor Based-KeyBoard Entry): The purpose of this section is to set forth functional specifications for a microprocessor based, fully traffic-actuated dual-ring, functional modular controller unit capable of providing up to eight phase signal operation. Timing and per phase functions shall be programmable by main frame single keyboard entry; per-phase modular entry is not acceptable. Single entry timing mode shall be provided.

In addition to the above named, the Controller must provide a true MENU format for data entry. As a minimum, a forty (40) character by four (4) line, alpha-numeric liquid crystal data display screen must be provided on the front of the controller. The display must be easily visible in both full daylight and at night. Back lighting the display is required.

The general design requirement of 715.42.2.2, as well as the NEMA

standards, shall apply except when the specific requirements exceed those in that section of the standards.

Phase designation and sequencing shall be as outlined in 715.42.2 of these Specifications.

The Controller must be capable of storing timings and other control parameters in an internal data memory. This data must then be accessible for display and/or alteration by means of front panel keyboard control and display. Coded memory access or other approved entry control must be provided.

Power requirements and recovery from power interruption shall be as specified in current NEMA standards for solid-state signal controllers. Internal backup battery power to maintain the controller memory for up to one year in the absence of A/C power input must be provided in the controller.

Full volume density operation per phase with walk must be an integral part of the controller logic, including variable initial and gap reduction. MUTCD flash operation, overlap programming, multiple phase configurations, partial or full entry capability, last car passage per phase and extended dual ring status display must also be provided in the controller.

All inputs, outputs, interface voltage and interface common returns shall be through front panel pin connectors. These connectors shall be as specified in 715.42.2.2.10. I/O pin functions shall be in accordance with current NEMA standards.

715.42.3-BLANK

715.42.4-Local Coordinating Units:

715.42.4.1-General Design Requirements: The following are minimum design and operating requirements for all types of local coordinating units. The general design requirements apply to master coordinating units and secondary coordinating units; both dial, electromechanical (LCU-EM) and digital, full solid state (LCU-DS). Local coordinating units provided for an interconnected signal system shall be completely compatible with the master controller and all local controllers in that system.

The coordinating units described shall be used in conjunction with solid state traffic actuated signal controllers and traffic adjusted master controllers. The coordinators shall inhibit the internal extension limit in the local controllers and provide external maximum control. Background cycle lengths, splits, system offsets and other coordination functions as required shall be called in by a master controller or coordinator. These functions may also be called in by local or master override or time switches.

For definition purposes, traffic phases shall be considered as running in sequence, such as A-B-C-D, etc. Also, any of these phases may consist of two separate auxiliary movements which must begin simultaneously but may end at different times, as long as the following phase is the auxiliary's associated thru-phase.

All coordinating units shall be furnished capable of at least the following:

- i. Three background time cycles.
- ii. A separate split associated with each time cycle.
- iii. Three offsets associated with each time cycle.
- iv. A variable permissive period for yielding to minor phases (B,C, etc.).
- v. External maximum limits (force offs) as required for all associated phases.
- vi. System offset interruption, unless provided for in the system master controller.
- vii. Capability of generating cycle lengths of at least 60, 70, 80, 90, 100 and 120 in association with each split and each offset.
- viii. Master-intersection control and supervision of other coordinating units as required.
- ix. Free operation when called for by the system master, time switch or manual override.
- x. A minimum of eleven independent in and out functions shall be provided per dial with associated circuitry to provide yield, force off, free operation, system sync, dial transfer, etc.

It shall be possible to set offset, splits and all synchronization functions from the front of the coordinating unit. It shall be possible to make these settings in at least one percent steps to any percentage of the associated cycle length and all such settings shall be clearly indicated.

Each coordinating unit shall be plug-connected, and it shall be possible to remove a unit and replace it with a similar unit without shutting off the power to the controller or signals. Removal of the coordinating unit and insertion of the coordinating unit harness receptacle into a shorting plug, which shall be mounted on the cabinet wall, shall cause the local controller to go to free operation.

In addition, each coordinating unit shall be provided with a switch on the front panel for selection of free or coordinated operation and at least the selection of one of three cycle lengths. Synchronization shall only be in effect in the coordinated position.

Switch indicator lights shall be provided at the local coordinating units to indicate the synchronization period in effect.

Absence or conflict of offset or cycle information on the interconnect shall place the coordinating unit in cycle number one, offset number one (average offset) or a pre-set standby cycle.

When the controller is working in coordinated operation, the internal maximum of the controller for Phase A shall be disabled. At all other times, the internal maximum of the controller shall remain operable.

Cycle change and transfer from free to coordinated operation shall take place at the first yield point (end of Phase A), unless otherwise specified.

When required in the coordinating unit, system offset interruption shall be adjustable in the range of at least 0 to 40 seconds. When the local coordinating

unit, for any reason, gets out of synchronization with the master system, the length of the dwell in any one cycle shall be limited to the time allowed by the offset interrupter. Timing shall start at the beginning of the dwell. A switch shall be provided to eliminate the offset interrupter from the interconnected system.

Any changes in the operation of traffic control signal lights caused by turning the signal lights off, or transfer to flashing or preempt operation shall not interfere with the continued in-time operation of the coordination timer. A transfer from such special operation back to normal automatic operation shall immediately establish the normal time cycle and subsequently the in-time relation.

Each coordinating unit shall be furnished with two service manuals complete with all necessary instructions and diagrams for the installation and maintenance of the equipment supplied and two complete wiring diagrams. These wiring diagrams shall identify the color code or wire tagging used in all connections.

715.42.4.2- BLANK

715.42.4.3-Time Base Coordinating Units(Type TBC): The purpose of this section is to set forth functional specifications and design requirements for signal coordinating units that do not require communications interconnect or synchronous motors to maintain a signal system time base. These units will be designated as Time Base Coordinating Units or TBC.

The general functional requirements in 715.42.4.1 for "hardwire" coordinating units shall apply to the TBC except where otherwise noted. All units shall be capable of the coordination of two (2) through eight (8) signal phases per controller.

TBC units are to be used in conjunction with solid state traffic actuated signal controllers.

The coordinating unit circuitry shall be of the latest solid state digital design. The units shall be completely self-contained and designed to be shelf mounted as auxiliary equipment in standard traffic signal controller cabinets.

The units shall operate normally on 115 VAC, 60 Hz line power and shall provide immediate standby battery power for the clock and programmable memory upon interruption of on-line power. Time base timing accuracy for normal (non-battery) operation shall be ± 1 second/month of continuous operation. Line voltage tolerance for specified operation shall be up to 135 VAC and down to 95 VAC. NEMA specified transient protection shall also be provided with each unit. Operating temperature, humidity and all other environmental tolerances specified in current NEMA standards shall be met.

Battery power for standby operation shall be of the rechargeable type and provide at least 100 consecutive hours of standby operation after 48 hours of normal operation with a minimum 3-year life. Standby clock accuracy shall be at least 0.005% in 48 hours.

The following programmable functions shall be available to the user via

715.42.5

front of unit keyboard entry.

Minimum 100 time of day (TOD) program events per day of week

Four (4) cycle lengths

Three (3) offsets per cycle

Two (2) daylight savings time changes

Free operation selection

Four (4) synchronization reference times (1 per cycle)

At least eight (8) outputs associated with the above functions shall be provided. Outputs must be provided for synchronization, yield, force-off, phase omit (etc.); in addition, a minimum of three (3) auxiliary outputs shall be available to operate controller functions such as flash, MAX II, change of phase sequence, switching of detectors (etc.). The outputs shall be of the voltage required by the system configuration.

All program entries shall be available upon demand on a front panel display that is easily readable when shaded from direct sunlight. Output status shall also be available on the unit front panel display. In addition, the unit shall give positive feedback to the programmer that a keyboard entry was made and recognized. This also must be displayed on the front panel by readily discernible means.

Program transfer capability via data transfer port and cable must be provided on each unit. Standard interconnecting cable for this function must be provided with each unit.

715.42.5-Traffic Detectors:

715.42.5.1-General Design Requirements: The following are minimum design and operating requirements for all types of traffic detector units. The general design requirements apply to both the loop detectors and the magnetic probe detectors. Detector units within a traffic-actuated system shall be completely compatible with the control units in that system.

The detector units described shall be used in conjunction with pre-timed fixed cycle traffic signal controllers, solid-state traffic actuated signal controllers and traffic adjusted master system signal controllers.

The detector circuitry shall be solid state and all component parts shall be of high quality meeting the maximum acceptable standards of good engineering practices. All components shall be amply derated with regard to heat dissipating capacity and rated voltage so that, with maximum ambient temperature and maximum applied voltage, material shortening of life or shift in values shall not occur. Any component called for by the circuit design which has special or unique characteristics which would limit that component to certain manufacturers or suppliers shall be so indicated in the manufacturer's installation, operation and service instructions.

The detectors shall be capable of sensing both passage and presence of vehicles and shall not be affected by rain or other weather conditions. It shall be possible to change from passage to presence detection by a selector switch mounted on the outside of the detector unit case. The passage or presence of

a vehicle over a road sensor shall activate an output relay.

The pulse detection mode shall provide a short output signal for each vehicle entering the roadway sensor zone of detection.

The presence detection mode shall provide a vehicle presence output signal for as long as a vehicle is stopped in the roadway sensor zone or as otherwise specified.

The detectors shall be designed "fail safe." In case of power failure, the output relay shall remain in the closed position.

All detector units shall be designed to operate from a 120 volt (plus or minus 10 percent), 60 Hz, AC power line service.

The detector units shall be completely self-contained and shall include an integral, fused power supply. The detector chassis shall be enclosed in a removable, sturdy aluminum or other non-corrosive metal case. The case shall furnish the chassis protection from moisture and other ambient conditions. The detector shall be of such a size as to readily fit into a cabinet with the signal controller when so required. All electrical connections to and from the detector unit shall be made through a multiterminal, quick disconnect, plug-type connector and wiring harness. Each wiring harness shall be at least 36 in. (900 mm) long. The harness end opposite the connector shall have color-coded leads or labeled sleeves. The harness connection shall be such that the detector may be replaced with a similar unit, without the necessity of disconnecting and reconnecting individual wires leading therefrom.

If the detector is mounted in the same cabinet with signal control equipment, all harness connections except power supply and vehicle call to controller shall be made on a separate terminal strip mounted in the controller cabinet for that purpose. Power supply connection and a vehicle call to controller may be connected to terminals on the controller back-panel.

A front panel light, clearly visible under full daylight conditions, shall be provided to indicate when a vehicle is in the detection area.

An instruction manual and an internal wiring schematic drawing shall be provided with each detector to facilitate installation, operation and service of the units.

The Contractor or equipment supplier shall turn over to the Division any guarantee or warranties which are given by the equipment manufacturer as a normal policy.

NOTE: The above general design requirements do not apply to pedestrian detectors. Pedestrian push buttons are covered in 715.42.5.4.

715.42.5.2-Loop Traffic Detectors (LPS):

The purpose of this section is to set forth functional specifications and design requirements for a solid state digital, automatically tuned and completely self-contained, shelf-mounted unit for detecting the passage or presence of vehicles when connected to a wire loop embedded in the roadway surface.

The general design requirements in 715.42.5.1 and NEMA standards shall apply except when the specific requirements exceed those in 715.42.5.1 and NEMA.

715.42.5

The detector shall respond only to vehicles either stopped in or passing over any portion of the roadway loop. The unit shall be capable of driving loops of various sizes and configurations within a range of 30-1,000 microhenries. It shall be capable of tuning loops of up to 50 feet (15 m) in length with up to 1,000 feet (300 m) of lead-in wire. The detector shall be capable of detecting vehicles traveling at any speed between zero and 100 mph. (0 and 160 km/hr.).

Individual sensor-detector assemblies shall operate satisfactorily under conditions where adjacent sensors are located within 6 feet (1.8 m) of each other.

The following minimum controls or equivalent shall be provided on the front panel of the detector.

- i. FrequencyHigh, median and low
- ii. Sensitivity.....As specified below
- iii. Presence.....As specified below

Sensitivity - Three selections of minimum thresholds that will detect changes in total loop inductance as low as (1) 0.02%, (2) 0.08% and (3) 0.32%.

Presence - Three selections of presence time modes (1) long - 3.5 minutes (minimum), (2) medium - 20 seconds (minimum), (3) pulse – 125± 25 milliseconds pulse per vehicle.

All electrical connections to the detector shall be made through a single front-mounted, 11 pin, amphenol connector. The connection mounted on the detector shall be male-type and shall be protected and rigidly fixed.

A mating female receptacle with appropriate cable clamps and at least 4 feet (1.2 m) of connecting harness cable shall be provided with each detector. The other end of the cable shall have color-coded leads, or labeled sleeves, each of which shall be fitted with positive grip, and crimp spade terminals for field connections.

The 11 pin connector on the detector shall have the following pin assignments: (Adapter harnesses will not be acceptable.)

PIN NUMBER	CIRCUIT
1	Fused side of 120 volt AC line
2	Neutral side of 120 volt AC line
3	Not Used
4	Earth
5	Relay common contact
6	Relay, normally open, contact
7	Loop
8	Loop
9	Relay, normally closed, contact
10	Not Used
11	Not Used

Detector loopwire and detector feeder cable shall be as specified in 715.42.13. Loop layout and configuration shall be specified in the plans, or as directed by the Engineer.

Output interfacing shall be by means of relay circuitry. All components shall meet the latest requirements of the NEMA Standards.

Type LPS SD detectors shall meet all the requirements of the specifications for 715.42.5.2 - Loop Traffic Detectors (LPS), but in addition, must have separate built-in stretch and delay timers with 0 to 15, 0 to 30, and 0 to 60 seconds timing ranges.

715.42.6-Adjustable Face Signal Heads:

715.42.6.1-Definition of Terms:

Lane Control Signal Head: An assembly containing one or more signal faces having indications used to permit or prohibit the use of specific lanes of a street or highway.

Lens: That part of the optical unit which redirects the light coming directly from the lamp and its reflector.

Optically Programmed Signal Head: An assembly containing one or more signal faces which may be designated accordingly as one-way, two-way, etc., permitting the visibility zone of the indication to be determined optically.

Optical Unit: An assembly of redirecting cover glass or lens, reflector, lamp and lamp socket with the necessity supporting parts to be used for providing a single signal indication.

715.42.6

Pedestrian Control Signal: A traffic control signal, manually, electrically or mechanically operated which is erected for the exclusive purpose of directing pedestrian traffic at signalized locations.

Signal Face: That part of a signal head provided for controlling traffic in a single direction. Turning indications may be included in a signal head.

Signal Head: An assembly containing one or more signal faces which may be designated accordingly as one-way, two-way etc.

Signal Indication: The illumination of a traffic signal lens or equivalent device or a combination of several lenses or equivalent devices at the same time.

Traffic Control Signal: Any device, whether manually, electrically or mechanically operated, by which traffic is alternately directed to stop and permitted to proceed.

NOTE: The above list of definitions may not be complete for all terms used. Final interpretations of all terms is the responsibility of the Engineer (see West Virginia Standard Specifications, Section 101).

715.42.6.2-Traffic Control Signal Heads: Each signal shall be of the adjustable, colored light, vertical type with the number and type of sections described and shown on the Plans. Each head shall have an indication in one direction only and shall be adjustable through 360 degrees about a vertical axis.

All new signal heads at any one intersection shall be of the same make and type.

Position of Signal Indications:

All signal indications shall be in a straight line and shall be in the following order although all indications shown need not be included in all cases. In vertical signals, Position 1 shall be at the top, the Position 8 at the bottom. In horizontal signals, Position 1 shall be at the left (facing the signal), and position 6 at the right.

POSITION		SIGNAL INDICATION
Vertical	Horizontal	
1	1	Red
2	2	Yellow
3	4	Green
4	5	Straight Thru Arrow
5	3	Left Turn Arrow
6	6	Right Turn Arrow
7		Don't Walk Symbol
8		Walk Symbol

Pedestrian signal indication shall be mounted separately below the conventional post mounted signal to allow for separate directional facing for

these indications and to obtain definition of the signal by spacing. At no time will a pedestrian signal indication be allowed to hang below an overhead-mounted signal.

Assembly:

Each head shall consist of an assembly of individual interchangeable sections securely bolted together to form a unit. There shall be no tie rods used in the assembly. The finished assembly shall present a clean, neat appearance. Each individual section shall house a complete optical unit. It shall be possible to assembly any combination of 8 in. and 12 in. (203 mm and 305 mm) heads without the use of special adapters.

The top and bottom of each section shall have an opening to accommodate standard 1½ in. (DN40) pipe brackets. The opening shall be in line vertically. The assembly shall be capable of being rotated between standard waterproof supporting brackets or trunnions and thus aimed in any direction in the horizontal plane. The portion of each section adjacent to the bracket openings and the portion used for connecting sections shall be properly reinforced to provide sufficient strength to resist shock, vibration and impact damage.

Each section shall have lugs for the mounting of at least one six-position, twelve-terminal, barrier-type terminal block.

Each section shall have lugs or pads such that backplates may be mounted without drilling or tapping the section.

The housing door shall be a one-piece square casting, having two hinge locations on the left side and at least one latch location on the right side. The hinges shall have stainless steel pins at least 3/16 inch (5 mm) in diameter. The latch shall consist (1) a latch jaw on the door and a stainless steel latch screw, wing nut, and washer securely affixed to the housing, or (2) a captive wing nut, washer, and screw assembly on the door and a captive nut in the housing. It shall be possible to open and remove the door without the use of any tools.

The door shall have a gasketed opening that shall provide a visible lens diameter of 7 ¾ to 8 in. (197 to 203 mm) for a nominal 8 in. (203 mm) lens and 11½ to 12 in. (292 to 305 mm) for a nominal 12 in. (305 mm) lens. All lenses shall be as described in 715.42.6.4.

The door shall have four equally spaced visor attachment points around the lens opening.

Visors shall be at least 7 inches (175 mm) long for an 8-inch (203 mm) lens and at least 9½ inches (241 mm) long for a 12-inch lens (305 mm). Visors shall be described as cutaway, tunnel, or full circle. All heads shall be supplied with tunnel visors, unless otherwise noted on the Plans or unless prior permission from the Division has been received. All new replacement signal heads at any one intersection shall have the same type as the existing visors supplied, unless otherwise specified on the Plans.

Visors shall be designed with a downward tilt between 3½ degrees and 5 degrees, shall eliminate the escape of light from one indication to another, and with the optical unit, shall eliminate the return of outside rays entering the unit from above the horizontal (known as sun phantom).

715.42.6

The Signal Sections, all brackets, trunions and suspension devices shall be painted in accordance with ITE (INSTITUTE TRANSPORTATION ENGINEERS) Specifications. The inside of the signal section visors shall be flat black enamel to eliminate objectionable reflections. Non-Metallic signal sections must have a color impregnated finish and be the same color as the enameled sections. The inside of non-metallic visors must also be painted with a permanent flat black enamel or use other means to prevent reflections.

The optical unit shall consist of the lamp, lampholder, reflector, lens gasket and lens, and shall be so designed that all light emitted by the unit passes through the lens and so that any possibility of false indications is eliminated.

The lampholder shall be of heat resisting material designed to properly position a medium screw base traffic signal lamp, with means to accommodate a lamp having light center 2-7/16 inches (60 mm) in length for the 60-watt and 100-watt series and 3 inches (75 mm) in length for the 150-watt series. The lampholder shall be provided with a lamp grip to prevent the lamp from working loose due to vibration. Provision shall be made on either the lampholder or the reflector holder to permit rotation of the lamp so that the lead-in wires are up and the lamp shall be retained securely in that position, but no change in position of the socket with respect to the optical center of the reflector shall occur. The metal portion of the lampholder shall be compatible with brass or copper.

Each lampholder shall be provided with two coded No. 18 or larger lead wires, type TEW, 600-watt, AWM fixture with 2/64 in. (0.8 mm), 221° F (105° C) rating thermoplastic insulation, securely fastened to the socket, and with sufficient length to reach the terminal block with the holder or door fully open.

The thermoplastic insulation shall at minus 30°F (-34° C) be capable of being bent six times around a 1 in. (25 mm) mandrel without damage to its insulating properties at rated voltage. A suitable terminal block or blocks shall be provided in the second section from the top or in each section of one-section heads. The terminal block shall have at least one section for each signal head section plus at least two additional sections per block. Terminal blocks shall be standard commercially available units.

Reflectors shall be specular aluminum in accordance with the latest ITE Specifications and shall be mounted in a reflector holder. The reflector holder shall provide a rigid reflector mounting to assure proper alignment between the lens and the reflector with the door closed. The reflector shall have a lampholder opening in the back. The reflector shall have a bead or flange on the outer edge to stiffen the reflector and insure its dimensional stability. The reflecting surface shall be totally free from flaws, scratches, defacements and mechanical distortion.

The lens gasket shall be a slotted circular neoprene gasket specifically designed to exclude moisture, dust and road film. The optical unit shall be sealed to exclude moisture and dust. This may be accomplished in one of two ways:

- i. If the open door contains the complete optical unit, the reflector/door

and the reflector/lampholder interfaces shall be equipped with specially designed neoprene seals to completely seal the optical unit. The section must not accumulate water.

- ii. If the reflector and lampholder remain in the section when the door is opened, the entire section shall be made watertight and dust tight by a weatherproof neoprene gasket contained in a gasket groove in the door. The gasket shall seal against a raised bead in the section to provide the proper seal.

The lighted signal shall appear to be illuminated over the entire visible lens surface without shadows when viewed from any angle up to 30 degrees each side of the optical axis horizontally and up to 45 degrees below the optical axis vertically.

The required appearance, light distribution and candle power intensity from the complete assembled section shall meet latest revision of the ITE Specification. "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads."

Trunnions, Brackets and Suspensions:

All trunnions, brackets and suspensions used for assembling and mounting vehicle traffic control signal heads shall be entirely weathertight without the use of externally applied sealants or caulking. The trunnions, brackets and suspensions shall be the same manufacturer as the signal heads.

All tubular parts shall be 1½ in. IPS (DN40) pipe. When hollow cast brackets or trunnions are used, they shall be of sufficient strength to support the maximum load imposed by the signal heads under all normal wind conditions.

The lower support or connection between signal heads in a spanwire or mast-arm mounted signal may be an aluminum casting or stamping of suitable strength.

Wire raceway areas within brackets, trunnions and suspensions shall be of adequate size to carry all necessary wires without crowding, and raceway surfaces shall be free of sharp edges or protrusions which might damage insulation on wires.

Suspensions for mast-arm or span-wire mounting shall include a device to permit adjustment for proper vertical alignment of the signal head.

Non-metallic trunnions, brackets and suspension parts previously approved by the Division may be supplied. Such parts must be capable of mounting both metallic and non-metallic signal heads and must have metallic reinforcement at points of anticipated wear.

Reinforcing metal must be compatible with aluminum, steel and galvanized steel.

Backplates:

All signal head assemblies so indicated on the Plans shall be provided with backplates designed to fit the combination of sections for each signal face.

These backplates shall be fabricated from non-ferrous metal of gage to

715.42.6

withstand distortion in 60 mph. (100 km/hr) winds and shall be firmly attached to each signal face in such a manner as to withstand the above wind load and to permit the opening of any signal independent from the other doors in the signal face.

Overhead signal heads shall have backplates with a 5 inch (125 mm) border.

Pedestal mounted signals shall have backplates with an eight inch (200 mm) border.

The backplates shall be finished with the best quality, oven-baked black enamel and shall comply with Federal Specifications TT-E-489.

715.42.6.3-Metallic Signal Heads: Each head of this type shall be constructed primarily of aluminum and aluminum castings and stainless steel, and shall meet all requirements in 715.42.6.2, and shall accept lenses and lamps as described in 715.42.6.4.

The section and door shall be one-piece, corrosion-resistant aluminum alloy die castings. Visors and reflectors shall be made from sheet aluminum or die castings.

All cast metal parts shall have a tensile strength of not less than 17,000 psi. (117 MPa) All castings shall be clean, smooth and free from flaws, cracks, blowholes and other imperfections. The castings shall conform to ASTM B 85 alloys SC84A, SC84B, SG100A, SG100B, S12A or S12B.

Sheet aluminum parts shall be manufactured from corrosion-resistant aluminum sheet having a tensile strength of at least 20,000 psi (138 MPa), except that reflectors shall be manufactured from the aluminum alloy suggested by the manufacturer.

All hinge pins and latch parts shall be Type 304, stainless steel.

Miscellaneous parts and hardware shall be made of non-corrosive materials.

All parts shall have sufficient strength to show minimal damage under severe loading conditions. Visors shall be not less than 0.05 in. (1.31 mm) thick. Reflectors shall be spun or drawn from aluminum not less than 0.025 in. (0.64 mm) thick.

715.42.6.4-Non-Metallic Signal Heads: Each head of this type shall be constructed primarily of a non-metallic material, aluminum and stainless steel, shall meet all requirements of 715.42.6.2 and shall accept lenses and lamps as described below. The non-metallic material used shall be durable and resistant to marring, scratching, discoloration, weather, temperature change, shock and color change from weather or photochemical action. The thickness of the non-metallic material shall be sufficient to provide at least the strength of the cast aluminum product of the same manufacturer at any location tested.

In addition, the finished section shall pass the following test for strength: A completely wired three-section head without lamps or visors shall be securely fastened between two brackets. A one-pound (450 gram) weight with a spherical tip 2 inches (50 mm) in diameter shall be impacted into the center

section on any surface including the door with an impact of 70 ft-lb. No part of any section, except the lens, shall be dented, cracked, crazed, chipped, punctured or otherwise visibly damaged.

The test shall be conducted at 0°F, 70°F and 120°F (at -18° C, 21° C and 49° C) ambient temperatures after the head has been kept at the test temperature for 12 hours. Immediately after the test, lamps shall be installed and the head shall be shown to function normally.

The non-metallic material, resin and reinforcement fibers, where used, shall be die-cast to produce a smooth glossy surface to which water, dirt and diesel oil will not readily adhere. Colors shall be cast integrally in the material. The finished product shall be free from all visible casting defects, including color variances. All hinge pins and latch parts shall be Type 304 stainless steel.

Miscellaneous parts and hardware shall be made of a non-corrosive material.

Visors shall be at least as strong as aluminum sheet with a tensile strength of 20,000 psi (138 MPa) and a thickness of 0.05 in. (1.3 mm)

All parts shall have sufficient strength to show minimal damage under severe loading conditions.

Lamps and Lenses:

Lamps: The lamps supplied with the traffic signal heads shall have the filament adequately supported to withstand the vibration induced from truck traffic and heavy winds. The light center length (LCL) is the dimension, in inches (mm), from the center of the filament to the tip of the base. All traffic signal lamps shall have a brass, standard, medium screw base, a clear glass envelope and shall be in conformance with the following design requirements:

- i. All 8 in. or 12 in. (203 or 305 mm) traffic signal indications shall have a lamp rating of between 110 and 120 watts, a light center length (LCL) of 2-7/16 in. (60 mm), with a minimum initial lumen value of 1,260 and a rated life of at least 6,000 hours.
- ii. All 8 in. or 12 in. (203 or 305 mm) traffic signal indications, used exclusively for flashing operation shall have a lamp rating of between 60 and 70 watts, a light center length (LCL) of 2-7/16 in. (60 mm), with a minimum initial lumen value of 665 and a rated life of at least 6,000 hours.

The glass envelope of the lamps shall be etched to show the manufacturers insignia or trademark, the voltage rating, the rated wattage and the rated life hours.

Lenses: The lens shall be standard prismatic red, yellow or green and shall be durable on prolonged exposure to weather. Each lens shall be of clear colored glass or polycarbonate resin, free from bubbles and flaws and shall be annealed to relieve internal stresses. Flashed lenses will not be accepted.

Lenses shall conform to the ITE Specification, "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads," and any revisions to the latest

715.42.6

edition.

The luminous transmission for traffic signal lenses and the limits of chromaticity for traffic signal colors shall be as follows:

RED The minimum relative luminous transmittance shall be 0.095; the value of y shall not be greater than 0.308 nor less than 0.998 minus x

YELLOW The minimum relative luminous transmittance shall be 0.440; the value of y shall not be less than 0.411 nor less than 0.995 minus x nor greater than 0.452

GREEN The minimum relative luminous transmittance shall be 0.200; the value of y shall not be less than 0.506 minus 0.519 x nor less than 0.150 plus 1.068 x nor greater than 0.730 minus x

Each lens shall be furnished with a label which shall indicate that the lens meets the specifications of the Institute of Traffic Engineers, "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads," January 2, 1966, and any revisions thereof.

All lenses, except arrows, shall have pressed on its flange the word "TOP" to indicate the proper positioning of the lens in the door for obtaining the light distribution required, together with the diameter and other designations, including the name or trademark of the manufacturer needed for proper application and help in purchasing replacements.

The nominal 8 in. (203 mm) lens shall have an outside diameter of from 8-5/16 in. to 8-3/8 in. (211 to 213 mm) The nominal 12 in. (305 mm) lens shall have an outside diameter of from 11-15/16 in. to 12-1/32 in. (303 to 306 mm) (These dimensions do not apply to the visible indication area of the optically programmed head.) Each lens shall fit into a specifically designed slotted circular neoprene lens gasket designed to fit the housing door in such a manner so as to exclude moisture, dust and road film.

Arrow Lenses:

Arrow lenses shall meet the ITE Specification, "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads," January 22, 1966, and any revisions thereof, and all other specifications above. The lens shall be of approved color specified above. All lenses shall be covered, except for the arrow with the light from a 200 watt lamp placed behind it. The enamel shall be baked or fired into the lens. The enamel shall be hard and durable and shall not peel or flake when subjected to the heat of a signal lamp when the lens is in use, or when the lens is washed. The arrow shall be the only illuminated portion of the lens.

715.42.6.5-Pedestrian Control Signal Heads (Incandescent): These Specifications cover symbolic pedestrian signal assemblies to be illuminated

by incandescent lamps mounted behind two lenses (one for each symbol), having translucent symbols.

General Design Requirements:

The nominal size of the lenses shall be 12 by 12 in. (305 by 305 mm).

Housing:

The housing shall be constructed of cast or sheet corrosion resistant, non-ferrous metal or plastic, or of a combination of these materials.

All cast metal parts shall have tensile strength of not less than 17,000 psi. (117 MPa) Sheet metal shall have a tensile strength of 27,000 psi. (186 MPa)

All parts shall be clean, smooth and free from flaws, cracks, blowholes and other imperfections.

If the housing and doors of the signal heads are made of aluminum alloy, they shall have one of the following compositions:

- i. If die castings are furnished, the alloys shall be in accordance with ASTM B 85 60T or the latest revision thereof, and the physical characteristics and chemical content of the alloy used shall be within the combined limits established by allows S-12A, S-12B, SC-84A, SC-84B, SG-100A and SG-100B of the ASTM Specification.
- ii. If sand castings are furnished, the alloys shall be in accordance with ASTM B 26 60T or the latest revision thereof, and physical characteristics and chemical content of the alloy used shall be within the combined limits established by alloys S-5A and CS-72A of the ASTM Specification.
- iii. If permanent mold castings are furnished, the alloys shall be in accordance with ASTM B 108 60T or the latest revision thereof, and the physical characteristics and chemical content of the alloy used shall be within the combined limits established by alloys S-5A and CS-72A of the ASTM Specification.
- iv. If sheets are furnished, the alloys shall be in accordance with ASTM 209 58T or the latest revision thereof, and the physical characteristics and chemical content of the alloy used shall be M1A of the ASTM Specification.

When required, the successful bidder shall furnish satisfactory evidence that materials comply with the foregoing requirements.

The housing shall be of unitized sectional construction and shall consist of as many sections as there may be optical unit levels. All sections shall be rigidly and securely fastened together into one weathertight signal face assembly.

Each housing shall be arranged with round openings in the top and bottom so that it may be rotated between waterproof supporting brackets on trunnions and thus be capable of being directed at any angle to the horizontal plane. The

715.42.6

openings shall be provided with a serrated ring which shall permit indexing and locking of the signal head in five-degree increments throughout the entire 360 degrees of rotation possible. The portion of the housing adjacent to the bracket shall be properly reinforced so as to have sufficient strength against breakage from shock.

The housing door of each signal section shall be a one-piece, corrosion resistant aluminum alloy die casting. Two hinge lugs shall be cast on the one side of the door and latch jaws shall be cast on the opposite side of the door.

The door shall be attached to the housing by means of two solid stainless steel hinge pins of not less than ¼ in. (6 mm) diameter.

A stainless steel latch screw, wing nut and washer on the latch jaw side of the housing shall provide for opening and closing the signal door without the use of any special tools.

A gasket groove on the inside of the door shall accommodate a weatherproof and dustproof seal.

The outer face of the door shall have tapped holes equally spaced about the perimeter of the housing to accommodate screws for securing the signal head visors.

Latch screws, hinge pins, wing nuts and washers shall be Type 304 stainless steel.

The housing door shall be finished with the best quality, oven-baked yellow enamel and shall comply with Federal Specifications TT-E-489.

The housing, when properly mounted using 1½ in. (DN40) pipe brackets, shall be able to withstand a concentrated load of 50 lbs. (23 kg) placed 6 inches (150 mm) from the centerline of the mounting brackets on either side of the opening or on both sides of the opening simultaneously. Such loading shall not produce sufficient deformation to cause the material to fail or to take a permanent set that would interfere with opening the door, rotation about the brackets, or loss of the weathertight integrity of the unit.

Visors:

Each signal head shall have a visor for each signal indication. The visor shall be designed to fit tightly against the door and shall not permit any perceptible filtration of light between door and the visor. The visor shall be 8 inches (203 mm) minimum in depth and inclined downward approximately 32 degrees with complete enclosure at the top and sides. The visor shall be of sheet construction and shall be of corrosion resistant, non-ferrous metal not less than 0.05 in. (No. 18 US gage) in thickness. The outside of the visor shall be of the same yellow enamel as the housing and door. The inside of the visors shall be painted a dull nonreflective black.

Pedestrian Signal Lenses:

Each lens shall be clear colored glass or plastic free from bubbles and flaws, and shall be annealed to relieve internal stresses. Flashed lenses will not be accepted.

Lenses shall conform to the ITE Specifications, "Adjustable Face

Pedestrian Signal Standard," and revisions thereof, where applicable.

The luminous transmission for pedestrian lenses and the limits of chromaticity for signal colors shall be as follows:

Portland Orange - Don't Walk Symbol - The luminous transmittance shall be not less than 0.300; the value of y shall not be greater than 0.390 nor less than 0.997 minus x .

Lunar White - Walk Symbol - The luminous transmittance shall not be less than 0.290; the value of x shall not be greater than 0.420 nor less than 0.329. The value of y shall not be greater than $0.510x$ plus 0.186 nor less than 0.510 plus 0.170.

Each lens shall have pressed on its flange such designation and trademark of manufacturer to facilitate proper application and to help in purchase of replacements.

The nominal 12 in. (305 mm) lens shall have minimum overall dimensions of 12 in. by 12 in. (305 by 305 mm) with a visible area of 11 in. by 11 in. (280 by 280 mm).

Message:

The Walk-Don't Walk symbols shall be according to the Standard Highway Signs Booklet, published by the Federal Highway Administration.

The surface of the lens, except for the symbol, shall be covered by opaque enamel of sufficient thickness to totally obscure the light of a 150-watt lamp when placed 12 in. (305 mm) behind the lens. The enamel shall be baked or fired into the glass and shall not peel or flake during normal use.

Reflectors:

Reflectors shall be specular Alzak finished aluminum and be designed for a 10 year service life.

Reflectors shall be mounted in a cast aluminum reflector support attached to the housing, or shall be an integral reflector and support of formed sheet aluminum.

The reflector assembly shall be pivoted to the housing and shall be designed so that it can be swung out or easily removed without the use of any tools.

The method of mounting and fastening reflectors shall be sufficiently rigid to secure proper alignment between the lens and reflector when the door is closed.

The construction of the signal head and its components shall be such that the fit between the reflector and the lens will eliminate all possibility of false indications.

Reflectors shall have an opening in the back for the lamp socket.

Pedestrian signal reflectors shall be of specular aluminum, the thickness of the anodic coating shall be a minimum of 0.0001 in. (2.5 μm) or its equivalent, spun or drawn from metal not less than 0.025 in. (0.64 mm) thick, equipped with a bead or flange on the outer edge to stiffen the reflector and insure its being held true to shape.

715.42.6

The reflecting surface shall be totally free of flaws, scratches, defacements or mechanical distortion.

Light Distribution:

The lighted signal shall appear to be uniformly illuminated over the entire message surface, without shadows when viewed from usual angles encountered in service. Distribution of light through the letters shall be uniform and free from halation or other uncontrolled scattering which may reduce legibility of the message.

The pedestrian indications should attract the attention of, and be readable to, the pedestrian (both day and night) at all distances from 10 ft. (3 m) to the full width of the area to be crossed. When not illuminated, the WALK and DON'T WALK symbols shall not appear to be illuminated by external light sources when viewed from the far end of the crosswalk they control.

Lamps:

Lamps supplied with the pedestrian signal heads shall have the filament adequately supported to withstand the vibration induced from truck traffic and heavy winds. All pedestrian signal lamps shall have a brass, standard, medium screw base and clear glass envelope. The light center length (LCL), or the dimension, in inches (mm), from the center of the filament to the top of the base, shall be in conformance with the following design requirements:

All pedestrian signal lamps for use in 12 in. (305 mm) pedestrian signal heads shall have a light center length of 3 inches (75 mm).

Pedestrian signal lamps shall conform to the following standards:

TWELVE-INCH PEDESTRIAN SIGNAL

Nominal Wattage	Rated Life Hours	Min. Initial Lumens
150 watt series	6,000	1,950

The glass envelope of the lamps shall be etched to show the manufacturer's insignia or trademark, the voltage rating, the rated wattage, and the rated life hours.

Lamp Receptacle:

The lamp receptacle shall be heat resisting material designed to properly position a medium screw base pedestrian signal lamp with means to accommodate a lamp having light center 3 inches (75 mm) in length for the 150-watt series. The receptacle shall be provided with a lamp grip to prevent the lamp from working loose due to vibration. Provision shall be made on either the lamp receptacle or the reflector holder to permit rotation of the lamp

so that the lead-in wires are up, and a secure fastening for the retention of the lamp in that position, but shall not permit any change in position of the socket with respect to the optical center of the reflector. The metal portion of the lamp receptacle shall be compatible with brass or copper.

Wiring:

Each lamp receptacle shall be provided with two coded No. 18 or larger lead wires, Type TEW, 600 volt, AWM fixture wire with 1/32 in. (0.8 mm), 221° F (105° C) rating thermoplastic insulation, securely fastened to the socket, and with sufficient length to reach the terminal block with the reflector fully open. The thermoplastic insulation shall at minus 30° F (-35° C) be capable of being bent six times around a 1 in. (25 mm) mandrel without damage to its insulating properties at rated voltage. A suitable terminal block signal housing shall be provided.

Trunnions, Brackets and Suspensions:

All trunnions, brackets and suspensions used for assembling and mounting vehicle traffic control sign heads shall be entirely weather-tight without the use of externally applied sealants or caulking. The trunnions, brackets and suspensions shall be the same manufacturer as the signal heads.

All tubular parts shall be 1½ in. IPS (DN40) pipe. When hollow cast brackets or trunnions are used, they shall be of sufficient strength to support the maximum load imposed by the signal heads under all normal wind conditions.

Wire raceway areas within brackets, trunnions and suspensions shall be of adequate size to carry all necessary wires without crowding, and raceway surfaces shall be free of sharp edges or protrusions which might damage insulation on wires.

715.42.6.6-Optically Programmed Traffic Signal Heads: The purpose of this section is to set forth the minimum specifications for all optically programmed traffic signal heads and associated equipment.

Signal Heads:

All signal heads shall be the nominal 12 in. (305 mm) type and shall be adjustable through 360 degrees about a vertical axis, with each individual section being adjustable plus or minus nine degrees about a horizontal axis, maintaining a vertical centerline through couplers and conduit. Each section shall be equipped with a sun visor.

All die cast aluminum parts shall conform to the following specifications or the latest revision thereof; Die casting SC-84A, SC-84B, SG-100A, SG-100B or S-12B of ASTM Specifications B 85. All stainless steel shall be of Type 304.

All surfaces outside of the signal heads (except the underside of the visors) shall be finished with the best quality, oven-baked yellow enamel and shall comply with Federal Specifications TT-E-489.

The signal head housing shall consist of an assembly of separate

715.42.6

interchangeable sections, expandable type for vertical mounting without tie rods, substantially secured together in a watertight manner to form a unit. Each section shall house an individual optical unit. The top and bottom of the signal housing shall have an opening to accommodate standard 12 in. (DN40) pipe brackets.

The optical system shall consist of a lamp, a circlet reflector, an optical limiter-diffuser combination and an objective lens. The lamp shall be nominal 150 watt, 120 volt AC, three prong, sealed beam having an integral reflector and an average rated life of 6,000 hours. A circlet reflector with a specular inter surface shall mate the lamp to the diffusing element. The optical limiter-diffuser combination shall provide an imaging surface, at focus on the optical axis for objects 900 to 1,200 ft. distance and permit an effective veiling system to be variously applied as determined by the desired visibility zone. The optical limiter-diffuser shall be provided with positive indexing means and composed of heat resistant glass. The objective lens shall be a high resolution planar incremental lens hermetically sealed with a flat laminate of weather-resistant acrylic. The lens shall be symmetrical in outline and may be rotated to any 90 degree orientation about the optical axis. Lens colors shall conform to the specifications of the Institute of Traffic Engineers, 1966, and any revisions thereof.

Each signal head shall be equipped with a dimming mechanism that will gradually reduce the candlepower for nighttime operation to approximately 15 percent of that for daytime operation.

The lamp fixture shall comprise a separately accessible housing and integral lamp support, ceramic socket and self-aligning, quick release lamp retainer. Electrical connection between case and lampholder shall be accomplished with an interlock assembly which disconnects the lampholder when open. Coded No. 16 lead wires shall be used of a length sufficient to permit solderless connection to line wires external to the signal.

All signal indications shall be in a straight line and shall be in the following order, although all indications shown need not be included in all cases. In vertical signals, Position 1 shall be at the top, and Position 8 at the bottom. In horizontal signals, position 1 shall be at the left (facing the signal), and Position 6 at the right.

POSITION		SIGNAL INDICATION
Vertical	Horizontal	
1	1	Red
2	2	Yellow
3	4	Green
4	5	Straight Thru Arrow
5	3	Left Turn Arrow
6	6	Right Turn Arrow
7		Don't Walk Symbol
8		Walk Symbol

Each signal head shall be equipped with a suitably designed visor. The underside of the visor shall be flat black paint.

Hardware:

All trunnions, brackets and suspensions used for assembling and mounting vehicle traffic control signal faces shall be entirely weathertight.

All tubular parts shall be 1½ in. IPS (DN40) pipe. When hollow cast brackets or trunnions are used, they shall be of sufficient strength to support the maximum load imposed by the signal heads under design wind conditions.

The lower support or connection between signal heads in multi-way span wire or mast arm mounted signals may be an aluminum casting or stamping of suitable strength.

Wire raceway areas within brackets, trunnions and suspensions shall be of adequate size to carry all necessary wires without crowding, and raceway surfaces shall be free of sharp edges or protrusions which might damage insulation on wires.

Suspensions for mast arm or span wire mounting shall include a device to permit adjustment for proper vertical alignment of the signal head.

715.42.6.7-Lane Control Signal Heads (Single Lamp):

General Design Requirements:

Each signal head shall be of the adjustable, colored-light type with the number and type of sections described and as shown on the Plans. Single indication heads shall be mounted on a vertical axis. Each head shall have an indication in one direction only and shall be adjustable through 360 degrees about a vertical axis for single indication heads, or about a horizontal axis for multi-indication heads.

All lane control signal heads at any one intersection shall be of the same make and type.

Position of Signal Indications:

All signal indications shall be in a straight horizontal line and shall be in the following order although all indications shown need not be included in all cases. Position 1 shall be at the left (facing the signal), and Position 3 at the right.

POSITION	SIGNAL INDICATION
1	Red X
2	Yellow X
3	Green Arrow

Assembly:

Each head shall consist of an assembly of individual interchangeable sections securely bolted together to form a unit. Sections shall be capable of being oriented horizontally or vertically without the use of additional parts. There shall be no tie rods used in the assembly. The finished assembly shall present a clean, neat appearance. Each individual section shall house a complete optical unit.

The ends of each section shall have an opening to accommodate standard 1½ in. (DN40) pipe brackets. The openings shall be in line. The assembly shall be capable of being rotated between standard waterproof supporting brackets or trunnions and thus aimed in any direction in the specified plane. The portion of each section adjacent to the bracket openings and the portion used for connecting sections shall be properly reinforced to provide sufficient strength to resist shock, vibration and impact damage.

Each section shall have lugs for the mounting of at least one six-position, twelve-terminal, barrier-type terminal block.

The housing door shall be a one-piece casting having two hinge locations and at least one latch location. The hinges shall have stainless steel pins at least 3/16 in. (5 mm) diameter. The latch shall consist of (1) a latch jaw on the door and a stainless steel latch screw, wing nut and washer securely affixed to the housing; or (2) a captive wing nut, washer and screw assembly on the door and a captive nut in the housing. It shall be possible to open and remove the door without the use of any tools.

The door shall have a gasketed opening that shall provide a visible lens area of 120 sq. in. (0.077 sq. m) for a nominal 12 in. (305 mm) lens and 289 sq. in. (0.185 sq. m) for a nominal 18 in. (455 mm) lens. All lenses shall be as described in 715.42.6.7.1.

The door shall have a gasketed opening that shall provide a visible lens area of 120 sq. in. (0.077 sq. m) for a nominal 12 in. (305 mm) lens and 289 sq. in. (0.185 sq. m) for a nominal 18 in. (455 mm) lens. All lenses shall be as described in 715.42.6.7.1.

The door shall have four equally spaced visor attachment points around the lens opening.

Visors shall be at least 10 in. (254 mm) long for a 12 in. (305 mm) lens and at least 12 in. (305 mm) long for an 18 in. (455 mm) lens. Heads shall be supplied with standard visors, unless otherwise noted on the Plans. All new signal heads at any one intersection shall have the same type visors supplied, unless otherwise specified on the Plans.

Visors shall be designed with a downward tilt between $3\frac{1}{2}$ degrees and 5 degrees, shall eliminate the escape of light from one indication to another and, with the optical unit, shall eliminate the return of outside rays entering the unit from above the horizontal (known as sun phantom).

The section and all brackets, trunnions and suspensions shall be finished with yellow enamel. The door and the outside of the visor shall be finished with either yellow or black enamel. The inside of the visor shall be finished with a flat black enamel. All enamel shall be best quality, oven-baked meeting Federal Specifications TT-E-489.

The optical unit shall consist of the lamp, lampholder, reflector, lens gasket and lens, and shall be so designed that all light emitted by the unit passes through the lens and so that any possibility of false indications is eliminated.

The lampholder shall be of heat resisting material designed to properly position a medium screw base traffic signal lamp, with means to accommodate a lamp having light center 3 inches (75 mm) in length for the 116-watt series and 6 inches (150 mm) in length for the 200-watt series. The lampholder shall be provided with a lamp grip to prevent the lamp from working loose due to vibration. Provision shall be made on either the lampholder or the reflector holder to permit rotation of the lamp so that the lead-in wires are up, and the lamp shall be retained securely in that position, but no change in position of the socket with respect to the optical center of the reflector shall occur. The metal portion of the lampholder shall be compatible with brass or copper.

Each lampholder shall be provided with two coded No. 18AWG or larger lead wire, Type TEW 600-watt fixture wire 2/64 in. (0.8 mm), 105° C rating thermoplastic insulation, securely fastened to the socket, and with sufficient length to reach the terminal block with the holder or door fully open. The thermoplastic insulation shall be at minus 30° F (-34° C) capable of being bent six times around a 1 in. (25 mm) mandrel without damage to its insulating properties at rated voltage. A suitable terminal block or blocks shall be provided in the second section from the left or in each section of one-section heads. The terminal block shall have at least one section for each signal head section plus at least two additional sections per block. Terminal blocks shall be standard commercially available units.

Reflectors shall be specular aluminum in accordance with the latest ITE Specifications and shall be mounted in a reflector holder. The reflector holder shall provide a rigid reflector mounting to assure proper alignment between the lens and the reflector with the door closed. The reflector shall have a lampholder opening in the back. The reflector shall have a head or flange on the outer edge to stiffen the reflector and insure its dimensional stability. The

715.42.6

reflecting surface shall be totally free from flaws, scratches, defacements and mechanical distortion.

The lens gasket shall be a slotted neoprene gasket specifically designed to exclude moisture, dust and road film. The optical unit shall be sealed to exclude moisture and dust. This may be accomplished in one of two ways:

- i. If the door contains the complete optical unit, the reflector/door and the reflector/lampholder interfaces shall be equipped with specially designed neoprene seals to completely seal the optical unit. The section must not accumulate water.
- ii. If the reflector and lampholder remain in the section when the door is open, the entire section shall be made watertight and dusttight by a weatherproof neoprene gasket contained in a gasket groove in the door. The gasket shall seal against a raised bead in the section to provide the proper seal.

The lighted signal shall appear to be illuminated over the entire visible lens surface without shadows when viewed from any angle up to 39 degrees each side of the optical axis horizontally and up to 45 degrees below the optical axis vertically.

The required appearance, light distribution and candlepower intensity from the complete assembled section shall meet latest revision of the specifications of the Institute of Traffic Engineers, "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads."

Trunnions, Brackets and Suspensions:

All trunnions, brackets and suspensions used for pedestrian signal heads shall be entirely weathertight without the use of externally applied sealants or caulking. The trunnions, brackets and suspensions shall be of the same manufacturer as the signal heads.

All tubular parts shall be 1½ in. IPS (DN40) pipe. When hollow cast brackets or trunnions are used, they shall be of sufficient strength to support the maximum load imposed by the signal heads under all normal wind conditions.

The lower support or connection between signal heads in a span-wire or mast-arm mounted signal may be an aluminum casting or stamping of suitable strength.

Wire raceway areas within brackets, trunnions and suspensions shall be of adequate size to carry all necessary wires without crowding, and raceway surfaces shall be free of sharp edges or protrusions which might damage insulation on wires.

Suspensions for mast-arm or span-wire mounting shall include a device to permit adjustment for proper vertical alignment of the signal head.

Non-metallic trunnions, brackets and suspension parts previously approved by the Division may be supplied. Such parts must be capable of mounting both metallic and non-metallic signal heads and must be compatible with aluminum, steel and galvanized steel.

Metallic Lane Control Signal Heads:

Each head of this type shall be constructed primarily of aluminum and aluminum castings and stainless steel, shall meet all requirements of 715.42.6.7 and shall accept lenses and lamps as described in 715.41.6.7.1.

The section and door shall be one-piece, corrosion-resistant aluminum alloy die castings. Visors and deflectors shall be made from sheet aluminum ordie castings.

All cast metal parts shall have a tensile strength of not less than 17,00- psi. (117 MPa). All castings shall be clean, smooth and free from flaws, cracks, blowholes and other imperfections. The castings shall conform to ASTM B 85 alloys SC-84A, SC-84B, SG-100A, SG-100B, S-12A or S-12B.

Sheet aluminum parts shall be manufactured from corrosion-resistant aluminum sheet having a tensile strength of at least 20,000 psi (138 MPa), except that reflectors shall be manufactured from the aluminum alloy suggested by the manufacturer.

All hinge pins and latch parts shall be Type 304, stainless steel.

Miscellaneous parts and hardware shall be made of non-corrosive materials.

All parts shall have sufficient strength to show minimal damage under severe loading conditions. Visors shall be not less than 0.05 in. (1.3 mm) thick. Reflectors shall be spun or drawn from aluminum not less than 0.025 in. (0.064 mm) thick.

715.42.6.7.1-Lamps and Lenses for Lane Control Signal Heads:

Lamps:

Lamps supplied with the lane control signal heads shall have the filament adequately supported to withstand the vibration induced from truck traffic and heavy winds. The light center length (LCL), is the dimension, in inches (mm), from the center of the filament to the tip of the base. All lane control signal lamps shall have a brass, standard, medium screw base and a clear glass envelope and shall be in conformance with the following design requirements:

HEAD SIZE	WATTAGE SERIES	LCL	MINIMUM RATED LIFE	MINIMUM INITIAL LUMENS
12	116	3 in. (75 mm)	6,000 hours	1,260
18	200	6 in. (150 mm)	6,000 hours	

The glass envelope of the lamps shall be etched to show: the manufacturer's insignia or trademark, the voltage rating, the rated wattage and

715.42.7

the rated life hours.

Lenses:

The lens shall be standard prismatic red, yellow or green and shall be durable on prolonged exposure to weather. Each lens shall be of clear colored glass or polycarbonate resin free from bubbles and flaws and shall be annealed to relieve internal stresses. Flashed lenses will be accepted.

Lenses shall conform to the specifications of the Institute of Traffic Engineers, "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads," January 22, 1966, and any revisions thereof. The luminous transmission for traffic signal lenses and the limits of chromaticity for traffic signal colors shall be as follows:

- | | |
|---------------|---|
| RED | The minimum relative luminous transmittance shall be 0.095; the value of y shall not be greater than 0.308 nor less than 0.998 minus X . |
| YELLOW | The minimum relative luminous transmittance shall be 0.440; the value of y shall be not less than 0.411 nor less than 0.995 minus X nor greater than 0.452. |
| GREEN | The minimum relative luminous transmittance shall be 0.200; the value of y shall not be less than 0.506 minus 0.519 X nor less than 0.150 plus 1.068 X nor greater than 0.730 minus X . |

Each lens shall be furnished with a label which shall indicate that the lens meets the latest revision of the specifications of the Institute of Traffic Engineers, "A Standard for Adjustable face Vehicle Traffic Control Signal Heads."

All lenses shall have pressed on the flange the work "TOP" to indicate the proper positioning of the lens in the door for obtaining the light distribution required, together with the size and other designations, including the name or trademark of the manufacturer needed for proper application and help in purchasing replacements. Each lens shall fit the housing door in such a manner so as to exclude moisture, dust and road film. All lenses shall be covered except for the X or the arrow with a dull or dark gray enamel of thickness sufficient to totally hide the light from a 200-watt lamp placed behind it. The enamel shall be baked or fired into the lens. The enamel shall be hard and durable and shall not peel or flake when subjected to the heat of a signal lamp when the lens is in use, or when the lens is washed. The X or the arrow shall be the only illuminated portion of the lens.

715.42.7-Auxiliary Traffic Signal Equipment: The purpose of this section is to set forth the minimum design and functional requirements for all types of optional auxiliary equipment which are described in this section.

All auxiliary equipment shall operate on 120 volts, 60Hz, AC power supply. The equipment operation shall not be affected by supply voltage variations between the limits of 10 percent above and 10 percent below 120

volts standard service. Similarly, the equipment operation shall not be affected by any change in temperature between the limits of plus 122°F (plus 50°C) and minus 30°F (minus 34°C) without the necessity of any heater element.

The Contractor shall furnish manufacturer's instructions for installing, maintaining and placing into operation the auxiliary equipment, along with engineering data, diagrams, etc. or any later changes or improvements which may increase the performance of the equipment purchased.

The Contractor is required to turn over to the Division any guarantees or warranties which are given by a manufacturer.

The Division reserves the right to withhold anypayment which may be due for equipment which does not meet Specifications.

Solid state flashers meeting current NEMA TS standards and capable of the above specified outputs and circuit ratings are an acceptable alternate to motor driven units.

715.42.7.1-Flasher Units: The purpose of this subsection is to set forth minimum specifications and design requirements for flasher units to perform the flashing combinations as specified on the Plans.

The signal flasher unit shall be a motor-driven switching device for flashing beacons or traffic signal indications at signalized intersections. It shall be designed for back-panel mounting in a flasher or traffic signal controller cabinet and shall be complete with jack-mounting subbase. The unit shall be capable of flashing two non-simultaneous signal circuits at a rate of not less than 50 nor more than 60 flashes per minute per circuit, with approximately 50 percent on and 50 percent off periods.

Each flashing circuit contact shall be rated at 15 amperes, 120VAC, 60 Hz under continuous make and break duty. The closing and opening of the flashing circuit contacts shall be accomplished in such a manner as to avoid undue pitting and burning. The flasher contacts shall be equipped with adequate integral radio interference filters.

The flasher motor shall be durable and provide a constant flash rate. It shall be designed for synchronous operation on 120VAC, 60 Hz and shall have lifetime lubrication.

715.42.7.2-Time Clocks: The purpose of this subsection is to describe the 24-hour electric programmable time clocks to be used inpretimed and traffic-actuated signal controllers.

The clock motors shall be designed for synchronous operation on 120 volts, 60 Hz, single phase alternating current. The clocks shall be programmable for circuit on-off operation at 15-minute intervals of the day.

In addition, the clocks must be capable of skip-a-day operation. Each clock dial shall provide from one to 48 on-off operations per day minimum in 15-minute settings. Each clock shall be capable of operating in a "power-off" condition for a minimum of ten hours. Drive for the clock when electric power is off shall be provided by a reserve spring which is wound automatically during "power-on" periods. All time clocks must be easily accessible and

715.42.7

demountable and fit within the controller cabinet.

715.42.7.3-Offset Interrupter: The purpose of this subsection is to set forth functional specifications and design requirements for a system offset interrupter.

The offset interrupter shall provide system offset interruption in the range of at least 0 to 40 seconds in one-second increments. No tools or additional timing gears shall be required to change the interruption interval. The interval shall be set by use of a calibrated dial on the front of the unit. The interruption period shall be of sufficient duration to release all dial or coordination units in the system, or both.

A switch shall be provided to eliminate the function of the offset interruption.

715.42.7.4-Preemption: Preemption equipment shall be constructed and wired so as to transfer control of the signals from the controller to the preemption unit when actuated by the method specified and shall provide the color sequence specified. The preemption shall cause a clearance interval to be timed prior to the preemption sequence if actuated during a "green" or "flashing yellow" interval, unless otherwise specified.

Pedestrian WALK-DON'T WALK signals shall be placed on DON'T WALK during the preemption clearance interval and shall be turned off during the preemption sequence, unless otherwise specified.

Installation of the preemption equipment shall not alter the internal wiring of the controller unit normally furnished by the manufacturer.

After release of the preemption, normal controller operation shall be automatically resumed at the beginning of the "green" interval specified on the Plans and on actuated controllers, calls shall be placed on all phase in order for the controller to complete one cycle before resuming normal actuated operation.

Two sets of complete wiring diagrams shall be provided showing the physical layout of all relays and other components of the preemption unit.

715.42.7.5-Electronic Time Switch: The purpose of this subsection is to describe the seven-day programmable time switch to be used inpretimed and traffic-actuated signal controllers.

The time switch shall be microprocessor-based and capable of SPDT switching of at least three (3) independent five-amp loads at 120 VAC. The entire unit shall be solid state and capable of at least 15 on or off time sets per day or week. Automatic battery backup providing a minimum of 48 hours of memory protection shall also be provided. The timer shall be entirely self-contained in a unit that can be readily mounted inside a signal controller cabinet.

715.42.7.6-Electronic Time Switch (Type DST): Specification requirements for this time switch are the same as outlined in 715.42.7.5, with the exception that automatic Daylight Savings Time compensation can be

programmed into this unit for an indefinite future period.

715.42.8 - Cabinets: The following are minimum design requirements for all types of weatherproof traffic control equipment cabinets:

The terminal facilities shall be furnished in either a basemount NEMA type 5 ("P") cabinet or a pole mountable NEMA type 4 ("M") cabinet as called for on plans. The cabinet shall be UL listed and have a UL approval label installed on the inside of the main cabinet door. The cabinet shall also have labeling indicating date of manufacturer, part number, and drawing identification number. Base-mount cabinets shall be supplied with a minimum of four 1.0" (25 mm) by 2.0" (50 mm) slotted holes for anchor bolt entry on the interior of the cabinet. Anchor bolt centers shall be 40.75" (1035 mm) wide by 18.50" (470 mm) deep. Four anchor bolts shall be supplied with the cabinet. The pole-mounted cabinet shall be mounted with the standard pole mounting brackets as shown on TES Standard Detail Sheets.

The cabinet shall be constructed of 0.125 inch (3 mm) thick 5052-H32 aluminum with the following minimum exterior dimensions: (Unless otherwise shown on the Plans)

	Base Mount	Pole Mount
Height	54 inches (1370 mm)	49 inches (1245 mm)
Width	44 inches (1115 mm)	30 inches (760 mm)
Depth	26 inches (660 mm)	17 inches (30 mm)

No cabinet shall exceed any of these dimensions by a maximum of 2 inches (50 mm).

All exterior seams of the cabinet shall be continuously welded for the entire length of the seam of the interior of the cabinet. Tack welding of seams and sealing with application of silicon or other sealers are not acceptable. Unless otherwise specified, the cabinet interior and exterior shall be furnished as natural (unpainted) aluminum. All surfaces shall be clean and free of oil, weld marks, etc. No holes for mounting rails or other main cabinet interior hardware shall be drilled through the cabinet walls. The conduit entry hole in the cabinet bottom must be field drilled to fit the location and the size of conduit required. The conduit entry hole must be placed as close as possible to the cabinet back wall when drilled.

715.42.8.1 - Cabinet Doors: A stainless steel main door handle shall be supplied which is capable of being padlocked in the closed (locked) position. The cabinet handle shall operate a door strike plate assembly via a minimum 0.5" (13 mm) square (or round) solid stainless steel rod. The handle shall be oriented in such a way that it rotates inward when operated to the open position. The main door lock must be a keyed tumbler lock.

The main door shall be secured with a three-point latch assembly. The three-point latch assembly shall consist of a stainless steel strike plate located directly behind the handle in the approximate vertical center of the door that secures the center of the door. The strike plate shall operate two plated steel or

715.42.8

stainless steel latch rods. The end of each rod shall be fitted with a minimum 0.75" (19 mm) diameter nylon roller complete with ball bearings to insure a smooth positive seal of the upper and lower main cabinet door. The main cabinet door shall be of essentially the same area as the front of the cabinet, and shall be provided with a #2 tumbler key lock and two keys.

The main door handle and all of its components shall be removable for replacement in the field. No parts shall be welded or permanently attached to the cabinet in any way that would restrict or prohibit replacement in the field with the use of simple tools.

The main door shall have a close cell neoprene gasket installed at its outer edge to form a watertight seal between the cabinet and main door. The gasket shall be a minimum of 1.0" (25 mm) by 0.5" (13 mm) thick and shall be secured between the edge of the door and an "L" shaped bracket welded to the inside of the door. This bracket shall extend virtually the full length of the gasket around the door. The gasket shall mate against the main door opening, which shall be formed as a double flange around the entire doorframe. The flange shall be bent in such a manner as to apply increasing pressure against the gasket as the main door handle is rotated to the locked position. An automatic doorstop shall be provided on both pole and base mount and shall be located on the bottom of the door.

The main door for base mount shall be attached by four stainless steel butt hinges and for a pole mount using only three stainless steel hinges - all which have minimum 0.25" (6 mm) diameter stainless steel pins. They shall be attached to the body of the cabinet and the door with 1/4 - 20 stainless steel carriage bolts and stainless steel nylon insert lockouts. The hinges shall be mounted in such a way that the pins are recessed and not removable with the main door closed.

715.42.8.2 - Mounting Rails: In a base mounted cabinet, four Unistrut rails shall be installed on each side of the cabinet and two on the back of the cabinet. For pole mounted cabinets, two Unistrut rails shall be installed on each side of the cabinet and two on the back of the cabinet. Each side rail shall extend from within 6" (150 mm) of the top of the cabinet to 6" (150 mm) from the bottom of the cabinet.

715.42.8.3 - Shelves: A minimum of two shelves the width of the cabinet with a minimum depth of 10.50" (265 mm) mounted toward the rear of the cabinet shall be supplied with each cabinet. Shelves shall be aluminum and shall have sufficient strength to support the controller unit and accessory equipment. Shelves longer than 36" (915 mm) shall be reinforced with an angle on the under side. Unless otherwise specified, the controller unit and conflict monitor shall be positioned on the top shelf. The shelves shall be attached with spring loaded Unistrut type nuts and stainless steel bolts.

715.42.8.4 - Ventilation: A motor-driven fan shall be mounted on a plenum in the top of the cabinet. It shall utilize roller (ball) bearings and be rated at 100 cubic feet per minute (45 liters/sec.). A finger guard shall be provided to cover the fan. The fan shall have an RC-network and V160LA20 MOV in parallel across the AC line to protect the controller unit from electrical

noise generated by the fan.

The fan shall be controlled by a variable thermostat located on the plenum in close proximity to the fan. The thermostat shall have a minimum adjustable turn and range of 80 to 130 degrees F (27 to 55 degrees C).

A filtered, weatherproof opening shall be provided on the main door near the bottom, a filter 12"x 16" x 1" (305 mm X 405 mm X 25 mm) shall fit smoothly and conveniently over this opening. The filter shall be the aluminum metal EX clean type and shall be reusable by blowing out dust particles. A positive filter retainer shall be supplied as a part of the main door assembly to firmly hold the filter against the opening. A fine mesh screen shall be provided between the filter and louvered opening to prohibit the entry of small insects. The screen shall be either aluminum or brass and fastened to the door permanently.

The exhaust for the fan shall occur above the main door under the top of the cabinet and shall be located to prevent entry of water into the cabinet. A perforated aluminum panel or screen shall be installed over the exhaust openings to prevent entry of small insects.

715.42.8.5 - Police Panel: A second hinged door (police panel), shall be located near the top of the main door for base mounted and near the bottom section of pole mounted cabinets. The police panel box shall be continuously welded to the main door. A gasket shall be provided on the inside of the police panel door for the full width of the door opening to insure a watertight seal. The police panel door shall be attached with a stainless steel hinge with a stainless steel hinge pin. The hinge shall be attached with tamper proof (one way) stainless steel screws and lockouts.

The police door shall be provided with a conventional police lock and key.

The police panel shall provide access to the following controls:

Manual Control/Auto Switch - Which shall be wired to the police panel terminal, but no switch will be provided unless called for on plans.
Manual Control Coiled Cord and Button (only if called for on plans).
Signal Auto/Flash Switch - On and Off (Flash transfer shall be accomplished thru de-energization of the flash transfer relays. Upon restoration to Signal Auto position from Flash, a momentary external start pulse shall be generated and applied to the controller unit to initiate the programmed start up sequence. AC power shall not be removed from the controller unit during flashing operation).

715.42.8.6 - Technicians Panel:

A technician switch panel shall be installed on the back cover of the police panel inside the controller cabinet. The following switches shall be supplied:

Detector Test Switches - Detector test push-button shall be installed in the cabinet so that calls can be placed on each vehicle and pedestrian phase. A push-button switch shall be provided and wired for each vehicle and each pedestrian phase (12 switches). Each switch shall mount in a 0.5" (13 mm) diameter hole and shall have a minimum 0.375" (10 mm) actuator.

Controller Unit Power Switch - A switch shall be installed so that power to the controller unit and conflict monitor timer can be turned off. This switch shall not remove power from the detector rack.

Signals ON-OFF Switch - The signal on-off switch, when in the off position, shall extinguish all signal indications for normal and flashing modes without interrupting the controller unit, conflict monitor and associated equipment power.

Emergency Flash Switch - This switch shall initiate cabinet flash by de-energizing the flash transfer relays. Transfer into out of emergency flash via this switch shall be immediate and shall not restart the controller unit when returned to the normal operating position.

Wiring Diagram Holder - A 9.5" x 12" (240 mm X 25 mm) or larger plastic holder shall be mounted to the inside of the cabinet door for convenient keeping of wiring diagrams, installations layout, and timing records.

715.42.8.7 - Technician Accessories: Convenience Outlet -A duplex convenience outlet shall be mounted on the inside right sidewall of the cabinet. The outlet shall be ground fault protected and shall be connected to the load side of the 20 amp circuit breaker that protects only the outlet, lamp, and fan.

Cabinet Light - A minimum 18" (455 mm) 15 watt fluorescent cabinet light shall be mounted on the inside of the cabinet above the door opening. The cabinet light shall have an RC-network and V150LA20 MOV in parallel across the AC line to protect the controller unit from noise. The door shall activate the cabinet light switch when the door is opened.

All hardware utilized in the cabinet assembly shall be aluminum, copper, nylon, brass, nickel plated brass or stainless steel.

715.42.8.8 - Terminal Facilities: Various panels shall be installed in the cabinet to mount the necessary terminal facilities required for the controller, coordination, preemption, detectors, and signal circuits required for a full eight phase cabinet and controller unit. **A FULLY WIRED NEMA "C" CONNECTOR MUST BE PROVIDED.** All terminal facility panels shall be fabricated from minimum 0.125" (3 mm) thick aluminum. The terminals shall be provided on thermoplastic or Bakelite blocks with stainless steel or nickel-plated brass machine screws. Signal light field terminals shall utilize minimum 10-32 screws, detector terminals shall utilize minimum 8-32 screws except other terminals shall utilize minimum six 6-32 screws except as otherwise noted in this specification. All terminals including terminal stripe, sockets, and other mounting shall be made with stainless steel machine screws and nuts. No

"Pop" rivets or other non-removable fasteners shall be permitted. Every terminal shall be silk-screened with a number and, when possible, the terminal function mnemonic. Panels that utilize feed-thru connections shall be silk screened with numbers and function mnemonics on both sides. No rub-on pressure sensitive or adhesive labels shall be permitted in the cabinet assembly. Special name plates, switch or relay identifications or other labels affixed in the cabinet or on the panels shall be made of white over black plastic that is engraved with the appropriate legend. These labels shall be permanently mounted to the cabinet or panel as applicable.

Terminal facilities shall be located on the back and sides of the cabinet and below the shelves wherever possible. All terminal strips and exposed electrical connections shall be no less than 6 inches (150 mm) from the floor of the base mount cabinet and no less than 3 inches (75 mm) for a pole mount cabinet. The lower right cabinet sidewall shall contain the power panel and its related components. The lower left cabinet sidewall shall contain the detector panel with the detector terminals, preemption terminals, system communication terminals and the MS D interface panel.

All wiring within the cabinet shall utilize stranded copper conductors. Conductors shall be properly sized for the operating ampacity. Insulation shall conform to MIL standards for Type BN conductors, clear nylon jacket over color-coded PVC insulation. Where wire size exceeds #18AWG, Type TFFN or THHN insulation may be substituted for Type BN insulation.

All wiring within the cabinet shall be properly terminated at all points. Harness connections and all other connections made on the back of the backpanel shall be terminated by soldering individual wires directly to the terminal strips. Slip on or fast-on type terminals or insulation displacement methods shall not be utilized on the back of any panel for any purpose. Where terminal screws are provided, a suitable spade type terminal lug shall be attached to the end of the wire. Any crimp connection to terminals shall be made only with a controlled cycle, ratchet type tool approved for use on the specific terminal being installed. In addition, no more than three wires may be connected under any terminal screw. Connections to the field terminal blocks for the conflict monitor conductors shall be made with the use of ring type terminals which require removal of the screw in order to disconnect the terminal. Right terminals shall not be used at any other location in the cabinet. Any stranded wire connection made to a compression type terminal (ground bar, neutral bar, etc.) shall require tinning of the strands with solder before insertion into the compression lug. Connections to circular connectors shall be made by soldering or machine applied crimp connections. Hand applied crimp connectors are not acceptable.

The following color code shall be utilized throughout the cabinet:

120 VAC	Black
120 VAC Neutral	White
Chassis Ground	Green
Logic Ground	Gray
+24 VDC	Red

These colors shall not be utilized for any purpose other than that so specified anywhere in the cabinet.

All harnesses shall be covered with "Expando" sleeving. Nylon cable ties, tape, etc. are unsuitable for use on harnesses.

All inductive loads shall be suppressed with a series R/C network consisting of a 0.1 uf 600 V capacitor and a 100 ohm 1/2 watt resistor connected in parallel with the load. In addition, a V150LA20 MOV shall be connected in parallel with the R/C network. The MOV and the R/C network shall also be provided on the duplex receptacle, fan, and fluorescent lamp. All DC inductive loads shall be suppressed with a reverse biased diode wired in parallel with the inductive load.

715.42.8.9 - Power Panel: Each cabinet shall be furnished with a power panel mounted on the lower right cabinet sidewall. This panel shall provide terminals for the incoming 120 VAC power line capable of accepting up to a #2 AWG conductors for line, neutral, and ground. In addition, the power panel shall provide mounting for circuit breakers 1 through 3, the surge arrester, line filter, mercury contactor, neutral bus bar, and ground bus bar. The circuit breakers shall be located on the panel closest to the main door opening.

All wiring on the power panel shall be properly sized for its application. Main power wiring between circuit breakers, surge arrester, line filter and mercury contactor shall be a minimum of #8 AWG conductor for line, neutral and ground functions. The power panel shall be furnished with a clearlexan safety cover to prevent accidental contact with the power panel components. The safety cover shall have a cutout area for access to the circuit breakers and shall be secured with thumbscrews for easy removal.

Three circuit breakers shall be provided for the incoming power distribution, Circuit breaker #1 shall be rated 30 amps and shall control the signal bus, detectors and control equipment. Circuit breaker #2 shall be rated 20 amps and shall power only the flasher and any related flash circuits. Circuit breaker #3 shall be rated 20 amps and shall power the fan, fluorescent lamp and duplex receptacle circuits.

A line filter shall be supplied to reduce any outgoing noise into the AC power line, minimum rating of the line filter shall be 60 amps.

A mercury relay-contactor shall be provided for control of power to the loadswitches (signal bus). This mercury shall be of a type specially designed to switch tungsten loads and shall incorporate a sealed type filled with nitrogen to eliminate "wicking" of the mercury to the electrodes under light load conditions. Minimum acceptable rating of the mercury relay for signal bus

control shall be 50 amps.

A main power lightning arrester shall be provided in the cabinet. The arrester shall consist of a primary and secondary stage. The primary stage shall be connected in parallel across the incoming AC line, neutral and ground. The line connections shall be made from the load side of circuit breaker #1. The neutral connection shall be made from the neutral power lug. The ground connection shall be made from the ground lug. Each of these connections shall be short and direct. No other connections shall be made for line, neutral or ground before the lightning arrester (except circuit breaker #1). The second stage of the lightning arrester shall be high-speed silicon protector intended to protect the controller unit, detector rack power supply, pedestrian call isolator and emergency vehicle preemption cards. The main power lightning arrester shall be an EDCO Model SHP 300-10. No substitutes shall be allowed without prior acceptance.

715.42.8.10 - Backpanel: Each cabinet assembly shall be furnished with a backpanel located on the lower center rear of the cabinet. The backpanel shall mount the loadswitches, flasher, flash transfer relays and controller unit input/output terminals. A base mounted cabinet shall have a 16 position backpanel (capable of terminating 16 loadswitches) and shall be provided. Further, 6 flash transfer relay bases shall be provided with terminals for flash color programming for loadswitches 1 through 12 (vehicle phases 1 through 8 and overlaps 1 through 4). The backpanel shall be mounted in such a way that it shall be possible to lower it for access to tall terminals on the rear with the use of simple hand tools. A pole-mounted cabinet shall have a 12 position backpanel (capable of terminating 12 loadswitches) and shall be provided. Further, 4 flash transfer relay bases shall be provided with terminals for flash color programming. Each backpanel shall be provided complete with all flash transfer relays. Per phase loadswitches shall be furnished as required for each intersection plus two spares.

Wiring on the back of the backpanel and all harnesses shall be color-coded for ease of troubleshooting. In addition, loadswitch input and output groups shall be color-coded orange for red, yellow for yellow and blue for green. Loadswitch outputs shall be wired with #16 AWG conductors. Harnesses shall be #22 AWG 19 strand and color coded* as follows:

MS A Harness	Blue
MS B Harness	Purple
MS C Harness	Pink
CM A Harness	Orange
CM B Harness	Yellow

*If The Color Coding Is Different, It Must Be Shown On The Cabinet Net Wire Diagrams.

715.42.8.11 - Detector Panel: Each cabinet shall be furnished with a detector field panel mounted on the lower left cabinet sidewall. This panel shall provide field terminals for the detector loops, pedestrian push-buttons,

715.42.8

emergency vehicle preemption detectors, system communication conductors and railroad preemption circuits. The detector panel shall provide the interface between the field conductors, the detector rack, the MS D interface panel and the backpanel. In addition to the field conductors, terminals shall be provided for the 8 vehicle detector inputs, 4 pedestrian detector inputs, 8 logic level phase green outputs, (diode isolated), per channel detector rack outputs, per channel pedestrian isolation outputs and per channel emergency vehicle preemption outputs. This arrangement shall permit full programming of detector and pedestrian call phase assignments as well as phase green delay inhibit functions without having to provide additional wiring to the backpanel or soldering of additional wires on the detector rack.

715.42.8.12 - MS D Interface Panel: A panel shall be provided on the upper left sidewall to provide an interface for MS D harnesses for different brands of NEMA controller units. The panel shall mount a circular plastic connector to provide a universal interface for the MS D functions listed below. All functions from the MS D panel shall be at logic ground levels. Each controller unit furnished shall be supplied with a MS D adapter cable 3 feet (900 mm) in length. This adapter cable shall mate with the circular plastic connector on the MS D interface panel and whatever connectors are provided on the specific controller unit. If a particular model of controller unit provided requires a different logic level, coding of functions, etc., the adapter harness shall be equipped with a logic unit to perform the necessary conversions.

The MS D Interface Panel shall be provided with a 120 VAC relay to provide electrical isolation for a railroad preemption circuit. This relay shall be wired with one side of the coil connected to a continuous, 1 amp fused source of 120 VAC. The other side of the coil shall be connected to a terminal. An adjacent terminal shall be provided with AC Neutral. These terminals shall be the connection point for the railroad circuit. The relay shall be maintained in a normally energized state with no train present. When a train is detected, the railroad circuit shall open and the relay shall de-energize and initiate the preempt sequence. A test switch shall be provided to open the coil circuit of the relay. A red LED shall also be provided next to the test switch to be illuminated whenever the relay is in its de-energized (preempt active) state. A V150LA20 MOV and R/C network shall be installed across the coil of the relay.

The MS D Interface Panel shall be provided with a 120 VAC relay to provide electrical isolation for the flash sensing circuit. This relay shall be connected to the coil of the mercury contactor and shall be energized under normal signal operating conditions. This relay shall de-energize if the cabinet flash transfer relays de-energize or if the signal power is de-energized. The output of this relay shall be connected to the controller unit for reporting of flash conditions to a central monitor. A V150LA20 MOV and R/C network shall be installed across the coil of the relay.

A door switch shall be provided and connected to the MS D Interface Panel to indicate cabinet door open status. This switch shall provide a logic ground input whenever the main cabinet door is open.

The following pin connections shall be utilized for the MS D Interface Panel circular plastic connector. The connector shall be AMP part number 206438-1.

	PIN		FUNCTION
1	Offset 1 In	31	System Detector 7 In
2	Offset 2 In	32	System Detector 8 In
3	Offset 3 In	33	Preempt 1 Out
4	Reserved		
5	Reserved	34	Preempt 2 Out
6	Offset 1 Out	35	Preempt 3 Out
7	Offset 2 Out	36	Preempt 4 Out
8	Offset 3 Out	37	Railroad Preempt Out
9	Reserved	38	Cabinet Flash Monitor
10	Reserved	39	Flash Command
11	Transmit (Controller to Master)	40	Flash Out
12	Transmit (Controller to Master)	41	Dial 2 In
13	Receive (Controller to Master)	42	Dial 3 In
14	Receive (Controller to Master)	43	Dial 2 Out
15	Online	44	Dial 3 Out
16	System Enable	45	Split 2 In
17	Free/Coord In	46	Split 3 In
18	Free/Coord Out	47	Split 2 Out
19	Preempt 1 In	48	Out
20	Preempt 2 In	49	Conflict Status
21	Preempt 3 In	50	Local Special Function 1 Out
22	Preempt 4 In	51	Special Function 2 Out
23	Railroad Preempt In	52	Local Special Function 3 Out
24	Enable Dimming	53	+24 VDC
25	System Detector 1 In	54	Logic Ground
26	System Detector 2 In	55	Chassis Ground
27	System Detector 3 In	56	AC Neutral
28	System Detector 4 In	57	120 VAC
29	System Detector 5 In		
30	System Detector 6 In		

715.42.8.13 - Detector Racks: A shelf detector rack shall be furnished fully wired to the detector panel. The detector rack shall be fully wired for all functions even though some functions may not be used at the present time. This includes a call output for each vehicle, pedestrian, a delay inhibit input for each vehicle channel, a common reset input for all vehicle channels and all necessary power conductors. The detector rack shall be a sturdy aluminum frame designed to mount card guides and edge connectors for all of the cards contained in the rack. All racks must be configured as shown on the following

special sheet labeled Dual Ring/Card Rack Mounted Detectors.

All loop lead-in wiring from the detector panel to the detector rack shall utilize tightly twisted conductors to eliminate coupling. Tightly twisted means a minimum of thirty-six twists per foot. Loop lead-in twisted pairs shall utilize a white/black stripe conductor for color-coding.

POSITIONS

	1	2	3	4	5	6	7	8
Channel 1	PH1	PH2	PH2	PH3	PH4	PCS	PCS	PCS
Channel 2	PH6	PH5	PH6	PH8	PH7	PH8	PCS	PCS

PCS = Priority Control System

715.42.8.14 - Documentation: Each cabinet assembly shall be provided with four complete and accurate wiring diagrams. The wiring diagrams shall contain an identification number which is also attached to the cabinet on an engraved nameplate. This number shall identify the prints for specific cabinet assembly. In addition to the wiring diagrams, a 3.5" disk shall be supplied with the cabinet containing the cabinet wiring diagrams in a ".DWG" format suitable for use with Autocad Version 12 (Windows version). The cabinet assembly will not be considered complete without the required documentation.

715.42.9-Signal Supports: Signal supports shall be certified to be equal or exceed the requirements of "Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals", including revisions, of the American Association of State Highway and Transportation Officials (AASHTO).

715.42.9.1-Mast Arm Signal Supports (Type A1, A1L, A2, A2L, B1 and B1L):

715.42.9.1.1-General Description: Mast arm supports Types A1, A2 and B1 shall consist of one two traffic signal mast arms (as designated on the Plans), an upright pole with anchor base and any other accessories or hardware as required to make a complete installation. They shall be designed to suspend traffic signals from a structural assembly similar in appearance and construction to that shown on the standard drawing which is part of the contract.

Mast arm supports Types A1L, A2L and B1L shall be identical to Types A1, A2 and B1 described above, except for the upright pole which shall be lengthened and provided with one or more street lighting luminaire arms as called for on the Plans. The upright pole length shall be governed by the mounting height specified for the luminaire and the rise provided in the luminaire arm. The luminaire arm, unless otherwise noted, shall be as similar as possible in style to that shown on the standard drawing and shall have the spread noted on the Plans.

All upright poles and all mast arms shall be made of one continuous piece, cylindrical in cross section, and they shall be uniformly tapered from butt to tip approximately 1 in. in diameter for each seven linear feet in length (0.14 in. per foot)(11.7 mm in diameter for each meter in length).

The shaft length and diameter of the upright pole and mast arm shall be as described on the Plans.

715.42.9.1.2-Mast Arm: All mast arms shall include a removable end cap, grommets wire outlets, signal hanger assemblies of the type and quantity shown on the Plans, and a flange plate welded to the butt end to provide a rigid connection to the upright pole. The rigid connection to the upright pole shall be constructed so that it develops and transfers the full strength of the mast arm to the upright pole. The flange plate shall have four holes for the flangebolts which shall match the four tapped holes in the mounting plate on the upright pole. The entire assembly shall be constructed so that all wiring can be concealed internally. It shall be as similar, as possible in appearance and construction detail to that shown on the standard drawing. The use of guy rods of any type, or trussed-type arms, will not be permitted (except when noted for luminaire arms on the Plans).

Mast arms shall be connected to the upright pole at a height necessary to provide 17 ft-0 in. (5.2 m) clearance under the signals. The mast arm and upright pole shall be constructed so that the mast arm at any point along its length (measured from the flange plate connection), will fall within a tolerance of 0 to 5 percent of that length, above the true horizontal position, after loading as called for on the Plans. The fabricator must certify to the above and maintain results of computations or tests to document the certification for each type of mast-arm pole supplied. On Types B1 and B1L this requirement will only apply to the outboard end of the mast arm. Any deviations from this

715.42.9

requirement due to sizes or loads listed on the Plans shall be brought to the Division's attention for appropriate corrective action prior to fabrication.

715.42.9.1.3-Upright Pole: Each pole shall consist of an upright shaft with a steel anchor base, a removable pole top, a J-hook wire support welded inside near the top, a handhole with reinforced frame and cover, anchor bolts and nuts, one flange plate assembly to match that welded to the butt end of each mast arm, and any other accessories or hardware as required to make a complete installation. Flange plates shall have a deburred wiring hole and four tapped holes for flange bolts. The handhole assembly shall be welded into the shaft near the base. The handhole reinforcing frame shall have a tapped hole to accommodate a grounding lug and contain a keeper chain. The keeper chain shall be secured by pop rivets or stainless steel screws. The cover shall be secured to the frame by at least two stainless steel screws. Each pole shall have a one-piece anchor base welded to the butt end. This base shall be designed to secure the pole assembly to a concrete foundation by means of four standard anchor bolts, each fitted with removable anchor bolt covers.

All construction details shall be as similar as possible to that shown on the standard drawing.

715.42.9.1.4-Materials Incorporated into the Support: The structures described above shall be fabricated from steel. The only exceptions permitted will be where the Contractor may prefer to use a cast aluminum pole top or aluminum anchor bolt covers, or both, on a galvanized steel pole.

All steel tubes for arms and poles shall be fabricated from ASTM A 595, Grade A or ASTM A 607, Grade 55, Class 2.

Miscellaneous steel materials required for fabrication of other structural components shall be of a weldable quality and shall be covered physically and chemically by an applicable ASTM Specification. This includes welding rod, plate and bar stock (for flanges, signal hangers, etc.) and casting for anchor bases.

Anchor bolts shall be fabricated from ASTM A1554 Gr. 55. Each bolt shall have the threaded end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Each bolt shall be provided with two regular nuts or heavy hex nuts that shall be hot dipped galvanized. Hex nuts shall be regular hex meeting ASTM A-563 Grade A for ¼" to 1½" (6.35 to 38.1 mm) sizes and shall be heavy hex for sizes 1½" to 4" (38.1 to 101.6 mm).

All mast-arm signal supports shall be provided with a one-piece, anchor-type base. The base shall be fabricated from material meeting ASTM A 27, Grade 65-35, or ASTM A 36 of sufficient cross section to fully develop the ultimate strength of the pole. The base shall be fastened to the pole by means of a welded connection and shall develop the full strength of the pole. The base shall be provided with four holes of sufficient size to accommodate the proper size anchor bolts that are capable of resisting at yield strength stress, the bending moment of the shaft at its yield strength stress. Four removable anchor

bolts covers shall be provided.

All steel components shall be galvanized after fabrication in accordance with ASTM A 123 or A 153. Galvanized coatings damaged for any reason shall be repaired by the application of a zinc-rich paint, conforming with 711.21 of the Standard Specifications. The places to be painted shall be thoroughly cleaned before the paint is applied.

All nuts, bolts or screws used to connect any aluminum components shall be passivated stainless steel meeting the requirements of AISI 300 series, commercial grade.

All nuts, bolts (except anchor bolts), or screws used to connect steel components shall meet the following requirements:

- i. Less than $\frac{5}{8}$ in. (16 mm) diameter shall be ASTM A 307 and plated in accordance with ASTM B 633, or stainless steel. An exception to this will be the two screws fastening the handhole cover, which shall be stainless steel in accordance with the description above.
- ii. For $\frac{5}{8}$ in. (16 mm) diameter and over, any ASTM physical and chemical qualification that is acceptable to the Division on the basis of structural design requirements and hot-dipped galvanized in accordance with ASTM A 153.

715.42.9.1.5-Drawings for Approval Purposes: Two prints of shop drawings indicating the proposed dimensions and material specifications for each of the components involved shall be submitted by the Contractor for approval purposes within three weeks after the award of the Contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved," or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved. Resubmission of drawings to obtain final approval by the Division will not be considered as being just cause for delay in the completion of any contract.

715.42.9.1.6-Mill Test Reports and Certification: Mill test reports or certifications of conformance to specifications for materials and design will be required for all materials incorporated into the work. The following shall be supplied by the Contractor prior to acceptance of the structures:

715.42.9.1.6.1: Mill test reports (MTR) for major structural items only, as noted in the following chart, shall include both physical and chemical descriptions of the materials as supplied to the fabricator. When physical properties are altered during fabrication, the MTR covering chemical composition shall be supplemented by certified test reports indicating the physical properties of this material after fabrication.

715.42.9.1.6.2: Certification of conformance to the specifications for all remaining material not covered by MTR as noted in the following chart.

See 715.42.9.1.6.1 See 715.42.9.1.6.2

Component Materials	MTR	CERTIFICATIONS
Tubes for arms and poles	X	
Base castings	X	
Anchor bolts	X	
Pole tops, misc. fittings and hardware		X
Fabricated or cast-type arm connections	X	
Galvanizing		X
Welding rod	X	

715.42.9.1.6.3: Certification of conformance to the specifications for the design of all components not completely dimensioned and detailed on the standard drawings.

715.42.9.1.6.4: Certification that all welding was performed by operators qualified as follows: steel welders to AWS and aluminum welders to ASME.

715.42.9.2-Strain Pole Signal Supports (Types C1, C1L, C2 and C2L):

715.42.9.2.1-General Description: Each strain pole support Type C1 and C2 shall consist of an upright shaft with steel anchor base, a removable pole top, a J-hook wire support welded inside near the top, a 45 degree wire inlet near the top, a handhole with reinforced frame and cover, anchor bolts and nuts and any other accessories or hardware as required to make a complete installation. The pole and all its component parts shall be designed to support free-swinging traffic signals suspended from a span wire assembly. It shall be as similar as possible in appearance and construction detail to that shown on the standard drawing which is part of the contract.

Each strain pole support Type C1L and C2L shall be identical to the type C1 and C2 described above, except that the upright pole shall be lengthened and provided with one or more street lighting luminaire arms as called for on the Plans. The shaft length of the Type C1L and C2L pole shall be governed by the mounting height specified for the luminaire and the rise provided in the luminaire arm. The luminaire arm, unless otherwise noted, shall be as similar as possible in style to that shown on the standard drawing and shall have the spread noted on the Plans.

The upright shaft shall be made in one continuous piece, cylindrical in cross section and shall be uniformly tapered from butt to tip approximately 1

in. in diameter for each seven linear feet in length (0.14 in. per ft) (11.7 mm per m). The diameter shall be measured outside to outside of the cylinder. No horizontal joints of any type will be permitted.

The shaft length and diameter of the Type C1, C1L, C2 and C2L poles shall be as described on the Plans. The signal clearance will be set for a minimum of 17 ft. in. (5.2 m) The span wire will be fastened from 12 in. (305 mm) to 18 in. (455 mm) from the top of the pole, except for the Type C1L and C2L poles, where the span wire height shall be as specified on the Plans.

715.42.9.2.2-Materials Incorporated into the Support: The entire strain pole assembly shall be made from steel. The only exceptions permitted will be where the Contractor may prefer to use a cast aluminum pole cover or aluminum anchor bolt covers, or both, on a galvanized steel pole.

The upright shaft shall be fabricated from ASTM A 595, Grade A or ASTM A 607, Grade 55, Class 2. The minimum wall thickness shall be 0.1793 in. (7 gage) (4.55 mm).

Miscellaneous steel material required for fabrication of other structural components shall be of a weldable quality and shall be covered physically and chemically by an applicable ASTM Specification. This includes welding rod, plate or bar stock (for span wire clamps, etc.) and castings for anchor bases.

Anchor bolts shall be fabricated from ASTM A1554 Gr. 55. Each bolt shall have the threaded end galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Each bolt shall be provided for two regular nuts or heavy hex nuts that shall be hot dipped galvanized. Hex nuts shall be regular hex meeting ASTM A-563 Grade A for ¼" to 1½" (6.35 to 38.1 mm) sizes and shall be heavy hex for sizes over 1½" to 4" (38.1 to 101.6 mm).

All strain pole signal supports shall be provided with a one-piece anchor type base. The base shall be fabricated from material meeting ASTM A 27, Grade 65-35 or ASTM A 36 of sufficient cross section to fully develop the ultimate strength of the pole. The base shall be fastened to the pole by means of a welded connection and shall develop the full strength of the pole. The base shall be provided with four holes of sufficient size to accommodate the proper size anchor bolts that are capable of resisting at yield strength stress, the bending movement of the shaft at its yield strength stress. Four removable anchor bolt covers shall be provided.

All steel components shall be galvanized after fabrication in accordance with ASTM A 123 or A 153. Galvanized coatings damaged for any reason shall be repaired by the application of a zinc-rich paint conforming with 711.21 of the Standard Specifications. The places to be painted shall be thoroughly cleaned before the paint is applied.

All nuts, bolts (except anchor bolts), or screws used to connect steel components shall meet the following requirements:

- i. Less than ⅝ in. (16 mm) diameter shall be ASTM A 307 and plated in accordance with ASTM B 633, or stainless steel. An exception

715.42.9

to this will be the two screws fastening the handhold cover which shall be stainless steel.

- ii. For 5/8 in. (16 mm) diameter and over, any ASTM physical and chemical qualification that is acceptable to the Division on the basis of structural design requirements and hot-dipped galvanized in accordance with ASTM A 153.

715.42.9.2.3-Drawings for Approval Purposes: Two prints of shop drawings indicating the proposed dimensions and material specifications for each of the components involved shall be submitted by the Contractor for approval purposes within three weeks after the award of contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved," or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved. Resubmission of drawings to obtain final approval by the Division will not be considered as being just cause for delay in the completion of any contract.

715.42.9.2.4-Mill Test Reports and Certification: Mill test reports or certifications of conformance to specifications for materials and design will be required for all materials incorporated into the work. The following shall be supplied by the Contractor prior to acceptance of the structures:

715.42.9.2.4.1: Mill test reports (MTR) for major structural items only, as noted in the following chart, shall include both physical and chemical descriptions of the materials s supplied to the fabricator. When physical properties are altered during fabrication, the MTR covering chemical composition shall be supplemented by certified test reports indicating the physical properties of this material after fabrication.

715.42.9.2.4.2: Certification of conformance to the specifications for all remaining material not covered by MTR as noted in the following chart.

See 715.42.9.2.4.1 See 715.42.9.2.4.2

Component Materials	MTR	CERTIFICATIONS
Tubes for upright shafts	X	
Base castings	X	
Anchor bolts	X

Galvanizing		X
Welding rod	X	

715.42.9.2.4.3: Certification of conformance to the specifications for the design of all components not completely dimensioned and detailed on the standard drawings.

715.42.9.2.4.4: Certification that all welding was performed by operators qualified as follows: steel welders to AWS and aluminum welders to ASME.

715.42.9.3-Wood Pole Signal Supports (Type D):

715.42.9.3.1-General Description: Each Type D wood pole shall consist of an upright shaft fitted with necessary hardware to make the installation complete.

The shaft length and diameter of the poles shall be as described on the Plans. The signal clearance will be set for minimum of 17 ft-0 in. (5.2 meters). The poles shall be of sufficient length to provide the luminaire mounting height when described on the Plans.

Maximum allowable span wire sag between supports is 5 percent of the pole to pole span. Maximum sag is measured at the point of the greatest offset of the span wire from a line in the plane of the support poles drawn through the span wire suspension points.

Spans supporting two signal heads or less shall not require tubular piping between the span wire mounting devices and the signal heads.

715.42.9.3.2-Material: Poles shall not have more than 180 degree twist in grain over the full length and the sweep shall be no more than 4 inches (100 mm).

715.42.9.3.3-Treatments: Poles shall be pressure treated in accordance with Section 710 of the Specifications.

715.42.9.4-Pedestal Pole Signal Supports (Types E1, E2, and E3):

715.42.9.4.1-Type E1: The pole shall consist of a cast aluminum base and tapered shaft. The shaft shall be spun from one piece of seamless tubing. Aluminum Association Alloy 6063 (ASTM B 221), having a nominal 0.125 in. (3.18 mm) wall thickness and 6 in. (152 mm) diameter at the base tapering to 42 in. (114 mm) diameter at the top which, after fabrication, shall have a mechanical strength of not less than T6 temper. The shaft shall have no longitudinal welds and no circumferential welds, except those joining the shaft to the base. A handhole shall be provided near the base.

The base shall be one-piece aluminum casting, Aluminum Association T-6 Temper (ASTM B 26). The base of adequate strength, shape, size and having a scalloped top flange, shall be secured to the lower end of the shaft by two continuous welds made by the metallic-arc-consumable-electrode-inert-gas-shielded process. The base shall telescope the shaft and one weld shall be on

715.42.9

the inside of the base at the end of the shaft, while the other weld shall be on the outside at the top of the base. The two welds shall be not less than 2 inches (50 mm) apart and the welded connection shall develop the design strength of the pole assembly. The base shall be provided with four holes to receive the anchor bolts and eight tapped holes for attaching the ornamental covers. Four removable bolt covers shall be provided with each base and each cover shall attach to the upright portion of the body of the base by means of two hex-head cap screws.

Anchor bolts shall be fabricated from ASTM 1554 Gr. 55. The threaded end of each anchor bolt shall be galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Four galvanized nuts and washers or clips as required shall be furnished with each pole. The anchor bolts shall be capable of resisting, at yield strength stress, the bending moment of the shaft at its yield strength stress. Bolts, nuts and washers or clips shall be galvanized to meet ASTM A 153.

The shaft shall have a uniform polished finish. Each shaft shall be tire-wrapped with a heavy water-resistant paper for protection during shipment and installation.

Two prints of shop drawings indicating the proposed dimensions and material specifications for each of the components involved shall be submitted by the Contractor for approval purposes within three weeks after the award of contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved," or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved. Resubmission of drawings to obtain final approval by the Division will not be considered as being just cause for delay in the completion of any contract.

715.42.9.4.2-Type E2: The pole shall consist of a base with anchor bolts and nuts and pipe shaft. The shaft shall be standard 4 in. Schedule 40 (DN100) pipe conforming to the requirements of ASTM A 501 and shall be welded to the steel base. A handhole shall be provided near the base.

The base shall be a one-piece cast steel anchor base, ASTM A 27, Grade 65-35, of adequate strength, shape and size secured to the lower end of the pipe shaft by two continuous electric arc welds. The base shall telescope the shaft and the one weld shall be on the inside of the base at the end of the shaft, while the other weld shall be on the outside at the top of the base. The design shall be such that the welded connection and base shall develop the calculated yield strength of the adjacent shaft section to resist bending action.

Anchor bolts shall be fabricated from ASTM 1554 Gr. 55. The threaded end of each anchor bolt shall be galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Four galvanized nuts and washers or clips, as required, shall be furnished with each pole. The anchor bolts shall be capable of resisting, at yield strength stress, the bending

moment of the shaft at its yield strength stress. Bolts, nuts and washers or clips shall be galvanized to meet ASTM A 153. Each anchor bolt shall be furnished with one cap nut (acorn).

Two prints of shop drawings indicating the proposed dimensions and material specifications for each of the components involved shall be submitted by the Contractor for approval purposes with three weeks after the award of contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved," or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved. Resubmission of drawings to obtain final approval by the Division will not be considered as being just cause for delay in the completion of any contract.

715.42.9.4.3-Type E3: The pole shall consist of a base with anchor bolts and nuts and a tubing shaft. The shaft shall be fabricated from United States Standard 13 Ga. (0.095 in.) (2.41 mm) weldable grade commercial quality carbon steel meeting ASTM A 607 Gr. 45 after fabrication. A handhole shall be provided near the base.

The base shall be fabricated from structural quality hot-rolled carbon steel plate with a guaranteed minimum yield strength of 36,000 psi. (248 MPa) The base plate shall telescope the shaft and be circumferentially welded top and bottom. The design shall be such that the welded connection and base shall develop the calculated yield strength of the adjacent shaft section to resist bending action.

Anchor bolts shall be fabricated from ASTM 1554 Gr. 55. The threaded end of each anchor bolt shall be galvanized for a length sufficient to extend down through the grout and into the concrete foundation. Four galvanized nuts and washers or clips as required shall be furnished with each pole. The anchor bolts shall be capable of resisting, at yield strength stress, the bending moment of the shaft at its yield strength stress. Bolts, nuts and washers or clips shall be galvanized to meet ASTM A 153. Each anchor bolt shall be furnished with one cap nut (acorn).

The finish for all exposed parts shall be hot-dipped galvanizing in accordance with ASTM A 123.

Two prints of shop drawings indicating the proposed dimensions and material specifications for each of the components involved shall be submitted by the Contractor for approval purposes within three weeks after the award of the Contract. These drawings will be reviewed by the Division at the earliest possible date and one print will be returned marked "Approved," or "Returned for Revisions as Noted." Eight sets of drawings shall then be submitted for final approval. Appropriate action shall be taken by the Contractor after final approval to insure that the earliest possible erection of these items can be achieved. Resubmission of drawings to obtain final approval by the Division will not be considered as being just cause for delay in the completion of any

715.42.9

contract.

715.42.9.4.4-Mill Test Reports and Certification: Mill test reports or certifications of conformance to Specifications for materials and design shall be supplied for pedestal pole signal supports (Types E1, E2 and E3) as required in 715.42.9.1.6.

715.42.10-Electrical Conduit:

Following are minimum design requirements for underground conduit housing signal control cable and other electrical wiring.

Unless otherwise specified on the Plans, all conduit shall be 2 inches (50 mm) in diameter.

The Plans will call for type of conduit to be used.

Approximate lengths of conduit are shown on the Plans. It is the responsibility of the Contractor to determine exact lengths of conduit runs in the field.

715.42.10.1-Type R (Rigid Steel Conduit): The steel conduit shall conform to American Standard Specification for rigid steel conduit, zinc-coated ASA C80-1 and current amendments.

Each length of conduit shall be furnished with one coupling.

Running threads shall not be used on conduit for connection and coupling.

All cut ends of conduit shall be reamed to remove rough edges.

Bends of rigid conduit shall be so made that the conduit will not be injured and the internal diameter of the conduit will not be effectively reduced.

715.42.10.2-Type F-(Flexible, Liquid-tight Conduit): Conduit shall be approved by Underwriters Laboratories.

Conduit shall have galvanized steel core over which is extruded a polyvinyl chloride cover.

Standard liquid-tight connectors shall be used for conduit connection.

Conduit shall protect electrical conductors from moisture, oil, grease, dirt, chemicals, corrosives, fumes, abrasion, etc.

715.42.10.3-Type P (Polyvinyl Chloride Conduit): Type P (Polyvinyl Chloride Conduit) shall be made of polyvinyl chloride plastic using polyvinyl chloride fillers where fillers are used. The conduit shall meet all requirements of EPC-40-PVC as contained in NEMA Standards Publication TC2, shall be Underwriters' Laboratories approved, and shall be suitable for direct burial.

715.42.11-Junction Boxes: Following are minimum design requirements for junction boxes for signal cable and other electrical wiring. The type will be noted on the Plans.

Junction boxes are shown on the Plans shall be installed where indicated. The Contractor may, with the approval of the Engineer and at their own expense, install additional junction boxes to facilitate the work of installing

conduit and pulling signal control cable.

715.42.11.1-Type L- (Light Duty): The box shall meet the requirements of Standard Drawing TES-50.

715.42.11.2-Type H-(Heavy Duty): The junction box shall consist of a concrete box with a cast iron frame and either a cast iron or ductile iron cover. The box shall meet the requirements of Standard Drawing TES-50 for the 10" x 10" (255 mm x 255 mm) size or TEL-43 for the 18" x 18" (460 mm x 460 mm) size.

The walls and floor of the concrete box shall be either precast or cast in place.

If cast in place in a paved area, the interior shall be formed and the exterior wall and floor may be poured directly against a smooth, well-trimmed hole in the pavement and ground.

If cast in place in other than a paved area, the interior and top 3 inches (75 mm) of the exterior shall be formed to provide the size and shape shown on the standard drawing.

The Type H (10x10) (255 x 255 mm) junction box cover and frame shall have a minimum weight of 90 pounds (40 kg). Type H (10x10) (255 x 255 mm) cover frame shall be cast integral with the concrete box.

715.42.11.3-Type M (Magnetic Probe Box): The box shall have a minimum inside dimension of 4 in. by 4 in. by 4 in (100 x 100 x 100 mm).

The junction box and lid shall be of copper-free aluminum meeting Federal Specifications W-C-583b.

The cover shall be attached to the box by monel or stainless steel screws. The cover shall also contain a neoprene gasket of sufficient size to make it watertight.

The wall thickness on the boxes shall not be less than ¼ in. (6.35 mm).

The lid shall have a checkered non-slip surface.

715.42.11.4-Types A, B, and C: Junction boxes Types A, B, and C shall meet the dimensions and requirements as shown on the Plans. Type A and B boxes shall be fabricated from steel conforming to ASTM A 36 with galvanizing in accordance with ASTM A 123. Wall thickness shall be 3 in. (6.35 mm) for Types A and B and not less than 14 gauge for Type C.

715.42.12-Messenger Cable: The messenger cable shall be of the diameter specified on the signalization plan and shall be fabricated on seven steel wires, double galvanized and twisted into a single concentric strand to conform to the following:

DIAMETER INCHES (mm)	SIZE OF WIRE (NO.)	TENSILE STRENGTH POUNDS (kg)
½ (12.7)	8	12,100 (5490)
7/16 (11.1)	9.5	9,350 (4240)
3/8 (9.5)	11	6,950 (3150)
5/16 (7.9)	12	5,350 (2425)
¼ (6.4)	14	3,150 (1430)
3/16 (4.7)	16	1,900 (860)

The Contractor shall, when requested by the Division, furnish in suitable form a certified report of the cable to show compliance with this Specification.

715.42.13-Conductors: All conductors used for traffic signal control and external circuitry shall be solid or stranded copper wire as required, unless otherwise specified. Wire sizes shall be based on American Wire Gage (AWG). The copper wire shall conform to the requirements of ASTM B 3 and B 8, latest revision. IMSA specification numbers refer to the International Municipal Signal Associations, Inc., latest revisions on wire and cable specifications.

All single conductors shall have clear, distinctive and permanent markings on the outer surfaces throughout the entire length, showing the manufacturer's name or trademark, insulation type-letter designation, conductor size and voltage rating.

Conductors for traffic signal and supplemental flasher installations shall be rated for 600-volt operation. The insulation shall be a minimum TW Grade or as specified.

All conductors subject to flexing, such as opening and closing of the cabinet doors or on removal of equipment from the cabinet, shall be stranded. Conductors No. 14 AWG through No. 10 AWG, inclusive, shall be 19-strand and conductors No. 16 AWG shall be 26-strand.

Conductors in traffic actuated controller cabinets between the power service terminals and the "AC+" terminals on the external signal load switching devices shall have an ampacity of 20 amperes at 160° F (71° C). This ampacity shall include all switching devices and connections to switching devices in this circuit as well as signal light neutrals and interference suppressors.

Conductors in pre-timed controller cabinets between the power service terminals and the controller bus to the signal light circuits shall have an ampacity of 20 amperes at 160° F (71° C). This ampacity shall include all switching devices and connections to switching devices in this circuit as well as signal light neutrals and interference suppressors.

All other conductors in the signal light circuits (both traffic actuated and pre-timed system) shall be No. 14 AWG solid conductor cable meeting IMSA Specification No. 19-1 or 20-1. Five-conductor signal light cable shall be used as a minimum per signal conductor run (see 660.16).

Power service conductors to the breakers (fuse) in all controller cabinets shall be No. 8 AWG service wire.

Conductors between the power service terminals, the "AC+" on all flasher units and the duplex receptacle shall have ampacity of 20 amperes at 160° F (71° C). This ampacity shall include all switching devices and connections to switching devices in this circuit as well as signal light neutrals and interference suppressors.

Conductors for traffic loops shall be continuous No. 14 THWN stranded wire to the detector terminals or the feeder cable junction box or conduit.

Detector feeder cable from the loop wire terminals to the detector terminals shall be two-conductor cable, No. 14 AWG-THW, meeting IMSA Specification 19-2, 20-2 or 50-2. The two conductor pair for each feeder shall be twisted together with approximately two turns per foot (6.5 turns per meter).

All other multi-conductor detector wiring, unless otherwise specified, shall be No. 14 AWG cable meeting IMSA Specifications No. 19-1 or 20-1. Single conductor detector wiring shall be No. 14 AWG-THWN stranded, unless otherwise specified.

Interconnect cable shall be No. 14 AWG cable meeting IMSA Specification No. 19-1 or 20-1.

All conductors used in the signal controller cabinets shall be No. 22 AWG, or larger. Conductors smaller than No. 14 AWG shall conform to Military Specification: MIL-W-16878D, Type B, Vinyl-Nylon Jacket, 600-volt, 105° C. Conductors No. 14 AWG and larger shall be as specified.

715.42.14-Supplemental Flashing Beacons and Mountings:

715.42.14.1-Flashing Signal Heads: The signal head shall provide an indication in one direction only and shall be adjustable through 360 degrees about a vertical axis.

Housing:

Each head shall be constructed primarily of aluminum and aluminum castings and stainless steel, shall meet all requirements in 715. 42.14.1 and shall accept lenses and lamps as described in the paragraph on Optical Unit.

The signal head housing shall be one piece, corrosion-resistant aluminum alloy die casting complete with integrally cast top, bottom, and sides. All cast metal parts shall have a tensile strength of not less than 17,000 psi. (117 MPa)

All parts shall be clean, smooth and free from flaws, cracks, blowholes and other imperfections.

The die cast aluminum housing, door and cast visor of the signal heads shall comply with the following specifications or latest revision thereof: Die Castings SC-84A, SC-84B, SG-100A, SG-100B, S-12A or S-12B of ASTM B 85.

When required by the Engineer, the successful bidder shall furnish satisfactory evidence that the materials comply with the foregoing requirements.

715.42.14

The top and bottom of the signal housing shall have round openings to accommodate standard 1½ in waterproof pipe brackets or trunnions. The portion of the housing adjacent to the bracket shall be properly reinforced so as to have sufficient strength to resist shock, vibration and impact damage.

Each signal head shall have lugs for the mounting of at least one six-position, twelve-terminal barrier type terminal block.

Each signal head shall have lugs or pads such that backplates may be mounted without drilling or tapping the head housing.

The housing door shall be a one-piece square casting having two hinge locations on the left side and at least one latch location on the right side. The hinges shall have stainless steel pins at least 3/16 inch (5 mm) in diameter. The latch shall consist of (1) a latch jaw on the door and a stainless steel latch screw, wing nut and washer securely affixed to the housing or (2) a captive wing nut, washer and screw assembly on the door and a captive nut in the housing. It shall be possible to open and remove the door without the use of any tools.

The door shall have a gasketed opening that shall provide a visible lens diameter of 7-¾ in. to 8 in. (197 to 203 mm) for a nominal 8 in. (203 mm) lens.

All lenses shall be as described in Optical Unit. The door shall have four equally spaced visor attachment points around the lens opening.

The section and door shall be one-piece, corrosion-resistant aluminum alloy die castings. Visors and reflections shall be made from sheet aluminum ordie castings.

Sheet aluminum parts shall be manufactured from corrosion-resistant aluminum sheet having a tensile strength of at least 20,000 psi (138 MPa) except that reflectors shall be manufactured from the aluminum alloy suggested by the manufacturer.

All hinge pins and latch parts shall be Type 304, stainless steel.

Miscellaneous parts and hardware shall be made of non-corrosive materials.

All parts shall have sufficient strength to show minimal damage under severe loading conditions.

Visors shall be at least 7 inches (178 mm) long and shall be described as standard (cut-away), tunnel, or full circle. Heads shall be supplied with standard visors unless otherwise noted on the plans or unless prior permission from the Division has been received.

Visors shall be designed with a downward tilt between 32 and 5 degrees to eliminate the return of outside rays entering the unit from above the horizontal (know as sun phantom). Visors shall be not less than 0.05 in. (1.3 mm) thick.

All mounting brackets, trunnions, and suspensions shall be finished with yellow enamel. The door and the outside of the visor shall also be finished with yellow enamel. The inside of the visor shall be finished with flat black enamel.

All enamel shall be best quality, over baked meeting Federal Specifications TT-E489.

Optical Unit:

The optical unit shall consist of the lamp, lampholder, reflector, lens gasket and lens, shall be so designed that all light emitted by the unit passes through the lens and so that any possibility of false indications is eliminated.

The lampholder shall be of heat resisting material designed to properly position a medium screw base traffic signal lamp, with means to accommodate a lamp having light center 2-7/16 in. (60 mm) in length for the 60-watt series.

The lampholder shall be provided with a lamp grip to prevent the lamp from working loose due to vibration. Provision shall be made on either the lampholder or the reflector holder to permit rotation of the lamp so that lead-in wires are up, and the lamp shall be retained securely in that position, but no change in position of the socket with respect to the optical center of the reflector shall occur. The metal portion of the lampholder shall be compatible with brass or copper.

Each lampholder shall be provided with two code No. 18 or larger lead wires, Type TEW, 600-watt, AWM fixture wire with 2/64 in. (0.8 mm), 105° C rating thermoplastic insulation, securely fastened to the socket, and with sufficient length to reach the terminal block with the holder door fully open.

The thermoplastic insulation shall at minus 30° F (-34° C) be capable of being bent six times around a 1 in. (25 mm) mandrel without damage to its insulating properties at rated voltage.

Reflectors shall be specular aluminum in accordance with the latest ITE specifications and shall be mounted in a reflector holder. The reflector holder shall provide a rigid reflector mounting to assure proper alignment between the lens and the reflector with the door closed. The reflector shall have a lampholder opening in the back. The reflector shall have a hood or flange on the outer edge to stiffen the reflector and insure its dimensional stability.

The reflecting surface shall be totally free from flaws, scratches, defacements and mechanical distortion. Reflectors shall be spun or drawn from aluminum not less than 0.025 in. (0.64 mm) thick.

The lens gasket shall be a slotted circular neoprene gasket specifically designed to exclude moisture, dust and road film. The optical unit shall be sealed to exclude moisture and dust. This may be accomplished in one of two ways:

- i. If the open door contains the complete optical unit, the reflector/lampholder interfaces shall be equipped with specially designed neoprene seals to completely seal the optical unit. The section must not accumulate water.
- ii. If the reflector and lampholder remain in the section when the door is opened, the entire section shall be made watertight and dusttight by a weatherproof neoprene gasket contained in a gasket groove in the door. The gasket shall seal against a raised bead in the section to provide the proper seal.

The lighted signal shall appear to be illuminated over the entire visible lens surface without shadows when viewed from any angle up to 50 degrees each

715.42.14

side of the optical axis horizontally and up to 45 degrees below the optical axis vertically.

The required appearance, light distribution and candlepower intensity from the complete assembled section shall meet the latest revision of the specifications of the Institute of Traffic Engineers, "A Standard for Adjustable Face Vehicle Traffic Control Signal Heads".

Trunnions, Brackets and Suspensions:

All trunnions, brackets and suspensions used for assembling and mounting vehicle traffic control signal faces shall be entirely weathertight.

All tubular parts shall be 1½ in. IPS (DN40) pipe.

The lower support or connection between signal heads in a span wire or mast arm mounted signal may be an aluminum casting or stamping of suitable strength.

Wire raceway areas within brackets, trunnions and suspensions shall be of adequate size to carry all necessary wires without crowding and raceway surfaces shall be free of sharp edges or protrusions which might damage insulation on wires.

Suspensions for the mast arm or span wire mounting shall include a device to permit adjustment for proper vertical alignment of the signal head.

Non-metallic trunnions, brackets and suspension parts previously approved by the Division may be supplied. Such parts must be capable of mounting metallic signal heads and must have metallic reinforcement at points of anticipated wear.

All reinforcing metal must be compatible with aluminum, steel and galvanized steel.

715.42.14.2-Flashing Mechanism: The signal head shall flash at a rate of not less than 50 not more than 60 flashes per minute with each lamp being lighted 50 percent of the time. The closing and opening of the flashing contacts shall be accomplished in such a manner as to avoid undue pitting and burning at 10 amps, 115 volts, A/C, continuous make and break duty. The flasher shall be equipped with adequate radio interference filter and protected by a fuse or circuit breaker.

Solid state flashers meeting current NEMA TS Standards and capable of the above specified outputs and circuit ratings are acceptable.

715.42.14.3-Time Clocks: The clock motors shall be designed for synchronous operation on 115 volts, 60 cycle, single phase alternating current.

The clocks shall be programmable for circuit on-off operation at 15 minute intervals of the day. In addition, the clocks must be capable of skip-a-day operation. Each clock dial shall provide from one to 48 operations per day, minimum 15-minute settings.

Each clock shall be capable of operating in a "power off" condition for a minimum of 10 hours. Drive for the clock when electric power is off shall be provided by a reserve spring which is wound automatically during "power-on"

periods.

All time clocks must be easily accessible and demountable and fit within the controller cabinet.

Electronic time switches as specified under Auxiliary Traffic Signal Equipment are an acceptable alternate to the above time clock.

715.42.14.4-Flasher Cabinet: Flasher cabinets shall conform to the requirements of 715.42.8.3.

The cabinet shall be provided with the necessary opening and attachments for mounting and connecting in the manner specified by one of the following options as indicated on the plans.

715.42.14.4.1-(OPTIONAL): Mounting to wooden poles by means of lag screws.

715.42.14.4.2-(OPTIONAL): Mounting to steel poles using pole attachment clamps.

715.42.14.4.3-(OPTIONAL): The flasher mechanism may be located within one of the signal heads when the head is of special design to permit this mounting without hindering the functioning of the flasher.

715.42.14.4.4-(OPTIONAL): The timing mechanism may be located within a building and housed in a non-weatherproof cabinet.

715.42.14.5-Mounting: The mounting of the sign must conform to one of the following types:

715.42.14.5.1-Post Mounted: The post mounted sign shall be located so that the nearest edge of the sign is not less than 6 feet (1.8 m) not more than 12 feet (3.6 m) from the edge of the traveled way or a minimum of 2 feet (0.6 m) and a maximum of 6 feet (1.8 m) outside an unmountable curb.

The bottom of the sign shall be a minimum of 8 feet (2.4 m) and not more than 15 feet (4.5 m) above the pavement grade at the center of the highway.

715.42.14.5.2-Pedestal Mounted: Use the same criteria as for 715.42.14.5.1 - Post Mounted.

715.42.14.5.3-Span Wire: The sign shall be located over the center of the lane that it faces on a two-lane roadway and in the center of the lanes it faces on a multi-lane roadway.

The span wire mounting shall be such that a minimum of 17-foot (2.4 m) and a maximum of 19-foot (4.5 m) clearance is maintained from the pavement to the bottom of the sign.

The span wire shall have a maximum sag of five percent of the span.

715.42.14

715.42.14.5.4-Mast Arm: The mast arm mounted sign shall be located so that the center of the sign is located over the lane or lanes to be controlled by the signs.

The mast arm mounting shall be such that a minimum of 17-foot (2.4 m) and a maximum of 19-foot (4.5 m) clearance is maintained from the pavement to the bottom of the sign.

715.42.14.6-Warranties and Guarantees: Any and all equipment shall be covered by manufacturer's written guarantee or warranty for a period of 12 months with respect to parts, workmanship and performance of product.

The department reserves the right to withhold any payments which may be due, should it be discovered that the equipment does not meet the Specifications.

The manufacturer shall make available, at no cost, engineering data, diagrams, etc., on any later changes or improvements which would increase the performance of the equipment purchased.

The manufacturer shall furnish instructions for installing and maintaining the equipment and assistance as required for timing and operation of the equipment.

715.42.14.7-Construction Methods: The materials furnished and used shall be new, except as may be specified on the Plans. All workmanship for electric work shall be in accordance with the details shown on the plans, the above Specifications, Special Provisions for 715.42 (Traffic Signals) as applicable, the Standard Drawing TES-36 and the requirements of the current National Electrical Code in addition to any local codes.

715.45-BENTONITE:

Bentonite shall meet the requirements of Section 3 of American Petroleum Institute Standard 13A and Supplements.

SECTION 716

EMBANKMENT AND SUBGRADE MATERIAL

716.1-GENERAL:

Material for embankment shall be suitable soil, granular material, shale, rock, random material, or borrow material. The material shall have dimension limitations in accordance with the contract documents.

Material for subgrade shall be granular material free of particles larger than 3 inches (75 mm).

716.1.1-Random Material: Random material shall be considered as a mixture of any or all of soil, granular material, or soft shale as described which are permitted by the Engineer to be used in embankment. These are materials that can be incorporated in a 6 inch (150 mm) compacted layer.

716.1.1.1-Soil: Soil material shall be considered as layers or deposits of disintegrated rock, lying on or near the surface of the earth; which has resulted from natural processes, such as weathering, decay or chemical action or a combination of these processes. Material shall be considered as soil when more than 25 percent by weight of the grains or particles pass the No. 200 (75 μ m) sieve.

716.1.1.2-Granular Material: Granular material shall be considered as natural or synthetic mineral aggregate, such as broken or crushed rock, gravel, sand, or slag. Shale or fly ash shall not be considered granular material. Granular material shall have not more than 25 percent by weight of grains or particles passing the No. 200 (75 μ m) sieve and the plasticity index shall not be more than 6. This material must be capable of being compacted to a stable condition.

716.1.1.3-Soft Shale: Shale shall be considered as a fine grained indurated, detrital material formed by consolidation (normally by compression or cementations or both) of clay, or silt, or clay and silt. Shale as defined may also have some fine sand. Shale is either characterized in the in situ condition as a stratified or massive structure. Shales which break down under three complete coverages with a steel drum roller, meeting the following requirements, shall be classified as soft shale to be placed as specified in [207.7.3.2.1](#). Smooth drum rollers shall provide a minimum compression of 500 pounds per linear inch (3.45 KN/mm) of roller drum and drum rollers with tamping feet shall provide a minimum compression of 500 pounds per square inch (3.45 KN/mm²) of tamping foot contact. The contractor shall provide the roller or rollers and any other necessary equipment for this test without additional compensation.

716.1.2-Rock: Rock is defined as sandstone, limestone, or concrete that

716.1.3

cannot be incorporated in a 6 inch (150 mm) compacted lift and shall be medium hard or harder.

716.1.3-Hard Shale: Material that meets the description of shale in 716.1.1.3 except that it does not break down under the hardness test shall be considered as hard shale and placed as specified in 207.7.3.2.2 when used as embankment material.

716.1.4-Borrow Material: Borrow shall consist of approved material required for the construction of embankments and other portions of the work and shall be subject to the applicable provisions of 211.

716.2-TEST METHODS

Plastic Limit	AASHTO T 90 or ASTM D 424
Grain Size Analysis	AASHTO T 88 or ASTM D 422
Sieve analysis of fine and coarse aggregate	AASHTO T 27
Amount of material finer than 200 sieve (0.075 mm) in aggregate	AASHTO T 11
Specific Gravity of Soils	AASHTO T 100 or ASTM D854
Specific Gravity and Absorption of Coarse Aggregate	AASHTO T 85 or ASTM C 127
Organic Content	AASHTO T 267
Moisture and density of soil and material having less than 40 percent of particles by weight retained on the $\frac{3}{4}$ inch (19 mm) sieve	MP 207.07.20
Moisture and density of material having 40 percent or more of the particles by weight retained on the $\frac{3}{4}$ inch (19 mm) sieve and that are relatively uniform in gradation and can be incorporated in a 12 inch (300 mm) lift or less, and granular subgrade	MP 700.00.24 (See MP 717.04.21, Table 2.2.3.1)
Liquid Limit	AASHTO T 89 or ASTM D 423

716.3-MOISTURE AND DENSITY REQUIREMENTS:

716.3.1-Embankment Moisture: Embankment soil and material having less than 40 percent by weight of particles retained on the $\frac{3}{4}$ inch (19 mm) sieve shall be moistened or dried to a tolerance of plus three percentage points or minus four percentage points from optimum at the time compactive effort is

applied. However, soils which evidence pronounced elasticity as the result of compactive effort shall be dried to optimum moisture content, if necessary to achieve stability.

716.3.2-Embankment and Subgrade Density:

716.3.2.1- Soil and material having less than 40 percent by weight of particles retained on the $\frac{3}{4}$ inch (19 mm) sieve shall be compacted within the moisture tolerance to a target percentage of dry density (Note 1) specified in Table 716.3.2.2. The maximum required dry density and the in-place dry density of the soil layers placed and compacted shall be determined by MP 207.07.20.

716.3.2.2- Soil and material having 40 percent or more by weight of particles retained on the $\frac{3}{4}$ inch (19 mm) sieve that are relatively uniform in gradation and can be incorporated in a 12 inch (300 mm) lift or less, shall be compacted to the target percentage of dry density (Note 1) specified in Table 716.3.2.2. The maximum required dry density shall be determined by Part 1 of MP 700.00.24. The in-place dry density of the soil layers placed and compacted shall be determined in accordance with Part II of MP 700.00.24

TABLE 716.3.2.2

Type of Construction	Target % of Dry Density (Note 1) of Material Having Less Than 40% by Weight Retained on the $\frac{3}{4}$ in. (19 mm) Sieve	Target % of Dry Density (Note 1) of Material Having 40% or More By Weight Retained on the $\frac{3}{4}$ in. (19 mm) Sieve and Granular Subgrade
Embankment	95	95
Subgrade	95	95

Note 1--Target percentage of density shall be the percentage of density by which the decision of acceptance is based. The percentage of dry density for each test shall be determined by comparing the in-place dry density with required maximum dry density.

716.3.2.3-Material, as outlined in MP 717.04.21, Table 2.2.3.1, shall be proof rolled with a pneumatic tire roller having an effective weight of 50 tons (45.5 Mg) . Alternate proof rollers, acceptable to the Engineer, may be used in lieu of a 50 ton (45.5 Mg) pneumatic tired roller provided the weight per tire and tire pressure is maintained so that a minimum of 1315 pounds per inch (9.067 KN/mm) width of tire is maintained. The roller shall be operated at a speed of not more than five miles per hour (8 km/hr.). The designated areas to

716.4

be proof rolled shall have two or more passes and the entire area shall be systematically covered with the proof rolling. During the proof rolling and after the proof rolling is completed, the area shall be checked for unstable areas or soft spots disclosed by the operation of the proof roller. These unstable areas or soft spots shall be corrected prior to placement of the overlying lifts of material. The Contractor may propose an alternate approach for small areas that are impractical to roll with the proof roller.

716.4-EMBANKMENT ORGANIC CONTENT:

The organic content of the embankment material shall not exceed 7.5 percent by weight as determined by AASHTO T 267.

716.5-ACCEPTANCE OF EMBANKMENT AND SUBGRADE:

The density of the embankment and subgrade will be accepted by the Division on a lot to lot basis provided the lot conforms to the specifications. A lot shall contain five approximately equal sublots. A sublot shall consist of not more than 2,500 cu. yd. (1900 cubic meters) for embankment and 400 linear ft. (120 m) per working width for subgrade. The Contractor's quality control testing shall include one nuclear moisture and density measurement made at a random location within each of the sublots. Each lot shall be presented to the Engineer for acceptance. When a lot consists of more than one lift, the Contractor's quality control testing shall normally include testing on each lift. Testing for density shall be in accordance with 716.3.2.1, or 716.3.2.2, whichever is applicable. The random locations shall be determined in accordance with MP 712.21.26. The Contractor's quality control testing will be evaluated for each lot and acceptance of the lot may be based either upon the Contractor's quality control testing or by independent testing performed by the Division. The acceptance decision will be made as soon as practicable after the Contractor has informed the Engineer that the lot is ready for acceptance.

If the results of density tests on a lot indicate that at least 80 percent of the material, in accordance with 106.3.1 (West Virginia APA), has been compacted to the specified target percentage of dry density, the lot will be accepted. If less than 80 percent of the material has been compacted to the specified target percentage of dry density, no additional material shall be placed on the lot until it has been reworked to meet the specified requirements.

Lots failing to meet the quality requirements shall be reworked by the Contractor at their expense and be resubmitted for acceptance. Evaluation of the reworked lots, when the testing is performed by the Division, shall be at the expense of the Contractor at the unit cost specified in 109.2.2. The quality requirements of this Subsection shall apply to the reworked lots.

SECTION 717

COMPACTION CONTROL OF BASE COURSE MATERIAL

717.1-GENERAL:

The Contractor shall notify the Engineer prior to construction of the test strips as set forth in MP 700.00.24. Further, the Contractor shall perform quality control compacting tests and shall record the data for all of their compaction testing on the forms as set forth in the Materials Procedures (MPs).

The test data shall be available to the Engineer at the time of testing or as indicated in the Contractor's quality control plan.

717.2-TEST METHODS:

717.2.1- Moisture, maximum density, quality control density and acceptance density for portland cement treated aggregate base course; hot-mixed, hot-laid bituminous treated aggregate base course; cold mixed bituminous treated aggregate base course; crushed aggregate base course; and aggregate subbase shall be determined in accordance with MP 700.00.24.

717.2.2- Maximum density, optimum moisture, quality control moisture-density and acceptance moisture-density for soil-cement base course shall be determined in accordance with MP 207.07.20.

717.3-MOISTURE:

717.3.1-The amount of moisture contained in soil-cement base course after mixing with portland cement is complete shall vary not more than three percentage points above or two percentage points below the optimum moisture, unless otherwise agreed by the Engineer. The optimum moisture shall be determined as specified in 717.2.2. The moisture content shall not exceed that quantity which will cause the soil-cement mixture to become unstable during compaction and finishing. The moisture content shall be determined as specified in 717.2.2.

717.3.2-The moisture content for crushed aggregate base course, portland cement treated aggregate base course and aggregate subbase shall be determined in accordance with 717.2.1.

717.4-DENSITY:

The wet density shall be determined for all base course material. The dry density shall be determined for portland cement treated aggregate base course, crushed aggregate base course, soil-cement base course and aggregate subbase.

TABLE 717.4.4

TYPE OF CONSTRUCTION	TARGET % OF DRY DENSITY	TARGET % OF WET DENSITY
Portland Cement Treated Aggregate Base Course	95	
Crushed Aggregate Base Course	95	
Aggregate Subbase	95	
Hot-Mix, Hot-Laid Bituminous Treated Base Course		95
Cold Mix Bituminous Treated Aggregate Base Course		95
Soil-Cement Base Course	95	

NOTE 1: The target percentage (wet) (dry) density is the percentage of density used for acceptance decision. The percentage of (wet) (dry) density for each test shall be determined by comparing the in-place (wet) (dry) density with the required maximum (wet) (dry) density.

717.5-PORTLAND CEMENT CONTENT CONTROLS:

717.5.1-The Contractor shall perform tests to determine the cement content of cement treated base (CTB). The tests shall consist of plant calibration procedures performed on a minimum frequency of one per each half day of production (sublot). The test data shall be available to the Engineer at the time or as approved in the Contractor's quality control plan.

SECTION 718

SEWER AND WATERLINE MATERIAL

718.1-IRON PIPE:

Ductile iron pipe for waterline applications shall conform to AWWA C151.

718.1.1: Cement lining shall conform to AWWA C104.

718.1.2: Fittings shall conform to AWWA C110 or C153.

718.1.3: Joints shall conform to AWWA C111. Flanged joints shall conform to C115.

718.5-PLASTIC PIPE (PVC):

For pressure applications pipe shall conform to AWWA C900 and CS-256 for sizes from 4 in. (100 mm) to 12 in. (300 mm), for pipes less than 4 in. (100 mm) ASTM 2241 and D1784 shall apply, for pipes from 14 in. (350 mm) to 16 in. (400 mm) AWWA C905 shall apply.

For non-pressure application pipe shall conform to ANSI B72.2, ASTM D3033 OR D3034.

Joints for sewerline shall conform to ASTM D3212. Joints for waterline shall conform to ASTM D3139.

718.7-PLASTIC PIPE (POLYETHYLENE):

Plastic pipe (polyethylene) shall conform to ASTM D2239 "PE3408". Additionally used for potable water, polyethylene pipe shall conform CS-255 and for pipes ½ in. (12.5 mm) to 3 in. (75 mm) AWWA 901 shall apply and shall be approved by the National Sanitation Foundation for use in transmitting liquids for human consumption.

718.9 - COPPER SERVICE LINE:

Copper Service Line shall conform to ASTM B88. Fitting shall be industrial quality and conform to AWWA C800.

718.10 – GATE VALVES:

Gate valves less than 3 in (75 mm) shall conform to Federal Specification WW-V-58B.

Gate valves greater than 3 in (75 mm), shall conform to AWWA C500 or C509.

718.11 – VALVE BOXES:

Valve Boxes shall be as specified on the plans.

718.12 - CASING- PIPE (STEEL):

Casing Pipe (Steel) shall conform to the following: "ASTM A53, Grade B, ASTM A139, Grade B or ASTM A252, Graded 2 for both waterline and sewer

718.13

line applications. Hydrostatic test requirements under ASTM A53 or ASTM A139 are waived.”

718.13 – FIRE HYDRANTS:

Fire Hydrantsshall conform to AWWA C502. See plans for specific details.

718.14 – METERS:

Meters shall conform to AWWA C700, type as required by the plans.

718.15 – MISCELLANEOUS STEEL (CLAMPS, RODS, ETC.):

Steel for miscellaneous rods, straps and clamps as required shall conform to the requirements of ASTM A 36 except that the maximum and minimum tensile strength requirements and chemical shall be waived.

718.20 – FINE AGGREGATE:

Fine Aggregate shall be crushed or uncrushed mineral aggregate with 100% passing the 3/8 in (9.5 mm) sieve.

718.21 – BEDDING MATERIAL:

Bedding Material shall conform to 703 and meet gradation for #67’s.
